END OF SECTION

Part 1 General

1.1 GENERAL REQUIREMENTS

- .1 Read and conform to Division 01 requirements and documents referred to therein.

1.2 REFERENCES

- .1 Definitions
 - .1 Information Documents means information of any type and in any form, related to the Project and identified in this Section as such and do not include the Contract Documents.

1.3 STATUS OF INFORMATION DOCUMENTS

- .1 Information document, by their nature, cannot reveal all conditions that exist or can occur on the Site. Should conditions be found to vary substantially from the report immediately notify the Consultant in writing and await instruction.
- .2 The Contractor shall not be entitled to extra payment or extension of the Contract Time for Work which is required and which is reasonably inferable from the reports as being necessary.

1.4 USE OF AND RELIANCE UPON INFORMATION DOCUMENTS

- .1 Information Documents are made available by the Owner for the purpose of providing the Contractor with access to information available to Owner.
- .2 Information Documents shall not be considered a representation or warranty that information contained therein is accurate, complete or appropriate, and do not form a part of the Contract Documents.
- .3 Bidder shall interpret and draw its own conclusions about Information Documents and is encouraged to obtain specialist advice with respect thereto. Prime Consultant assumes no responsibility for such interpretations and conclusions.
- .4 Information contained in Information Documents may be time sensitive and dates shall be considered when interpreting Information Documents.
- .5 Bidder may rely upon the data contained in Information Documents, or parts thereof, which are specifically incorporated into Contract Documents by means of copying, transcribing or referencing, but shall draw his own conclusions from such data and shall not rely on opinions or interpretations contained therein.

1.5 INFORMATION DOCUMENTS

- .1 Information Documents, in whole or in part, consist of the following:
 - .1 Geotechnical Investigation for Modification of Ponds at 3525 Baseline Road, Sutton, Ontario dated December 6, 2024 prepared by Engtec Consulting Inc.
 - .2 Geotechnical Investigation for Maintenance Building Expansion at Roads Operations Centre at 3525 Baseline Road dated December 4, 2023 prepared by Engtec Consulting Inc.

- .3 Designated Substances and Hazardous Materials Survey dated November 20, 2020 prepared by ECHO Environmental Consulting Occupational Health
- .4 Designated Substances Survey dated July 12, 2024 prepared by LEAP Management Inc.
- .5 Stormwater Management Report dated July 26, 2024 prepared by Resilient Consulting Corporation.
- .6 LEED Energy Model Report dated May 23, 2025 prepared by MCW Consultants Ltd.
- .7 LEED v4 Overall Documentation Progress dated May 23, 2025 prepared by MCW Consultants Ltd.
- .8 Hydrogeological Assessment dated September 28, 2022 prepared by Harden Environmental Services Limited.
- .9 Soil Characterization Report dated March 11, 2025 prepared by Engtec Consulting Inc.
- .10 Soil Characterization Report: Stockpile Sampling and Delineation Samples dated April 4, 2025 prepared by Engtec Consulting Inc.
- .11 Assessment of Past Uses dated March 11, 2025 prepared by Engtec Consulting Inc.
- .12 Construction Dewatering Assessment dated November 21, 2024 prepared by Hydrogeology Consulting Services.
- .13 Summary of Salt-Impacted and Contaminated Soils dated April 14, 2025.
- .14 Soil Management Plan (SMP) - York Region North Road Operations Centre at 3525 Baseline Rd, Georgina, ON. dated April 7, 2025 prepared by Engtec Consulting Inc.
- .15 Property Services Branch Facilities Signage Guidelines dated April 24, 2023 prepared by York Region

END OF SECTION

Part 1 General

1.1 GENERAL REQUIREMENTS

- .1 Read and conform to Division 01 requirements and documents referred to therein.

1.2 WORK COVERED BY CONTRACT DOCUMENTS

- .1 The Work of this Contract includes, but is not limited to, general construction of and renovations to North Roads Operations Centre, located at 3525 Baseline Road in the Town of Georgina, Ontario. The Work includes the construction of the building and related sitework.
- .2 Work specified in Specifications is divided into Divisions and Sections for reference purposes only. Except as may be otherwise specified in the Contract, division and coordination of the Work among Contractor, Subcontractors, Sub-Subcontractors and Suppliers is the Contractor's responsibility.

1.3 LEED CERTIFICATION

- .1 The Project is registered for LEED NC Version 4 certification with an anticipated certification level as indicated. The Contractor, Subcontractor, Suppliers, and manufacturers are required to participate to achieve LEED certification.
- .2 To obtain LEED Certification, the Project must meet certain LEED prerequisites and obtain certain LEED credits. A summary of prerequisites and credits for which the Project will be seeking certification are outlined in 01 35 22 – LEED NC V4 Checklist. Refer to LEED Requirements for a full description of Contractor's LEED responsibilities.
- .3 Follow special administrative procedures and submit special Submittals to assist the Owner in obtaining LEED certification. Refer to Green Product Information Submittal Forms to determine required LEED submittals.
- .4 At contract award, the Contractor shall appoint a Contractor LEED Coordinator to be responsible for all Contractor LEED responsibilities and submittals. The Contractor LEED Coordinator must either have a LEED AP designation, a LEED GA designation, or experience in all aspects of Contractor LEED responsibilities.
- .5 Where the term 'LEED' is used within these Specifications it refers to the LEED (Leadership in Energy and Environmental Design) NC Version 4 for Building Design and Construction Rating System, including detailed requirements as set out in the LEED v4 Reference Guide.

1.4 COMMUNICATION METHOD

- .1 Work of this Contract will be recorded and administered through ftp site. Contractor and Subcontractors will provide accounts, and communication will be sent back and forth through this program to allow ease of access for Owner, Consultants, Contractor, subtrades, and other permitted parties.

1.5 CONTRACT METHOD

- .1 Construct Work under single stipulated price Contract.

1.6 WORK SCHEDULE

- .1 Reach Substantial Performance of the Contract and Total Performance of the Contract by date as required in Contract.

1.7 CONTRACTOR USE OF PREMISES

- .1 Limit use of premises for Work, for storage, and for access, to allow:
 - .1 Owner occupancy.
 - .2 Partial Owner occupancy.
 - .3 Work by Other Contractors.
 - .4 Public usage.
- .2 Co-ordinate use of premises under direction of Consultant.
- .3 Obtain and pay for use of additional storage or Work areas needed for operations under this Contract.
- .4 Remove or alter existing Work to prevent injury or damage to portions of existing Work which remain.
- .5 Repair or replace portions of existing Work which have been altered during construction operations to match existing or adjoining Work, as directed by Consultant.
- .6 At completion of operations condition of existing Work: equal to or better than that which existed before new Work started.

1.8 OWNER OCCUPANCY

- .1 The Owner will occupy premises and adjacent buildings during entire construction period for execution of normal operations. Refer to Appendix H for more details.
- .2 Co-operate with the Owner in scheduling operations to minimize conflict and to facilitate Owner usage. Refer to Appendix H for more details.

1.9 DOCUMENTS REQUIRED

- .1 Maintain at job site, one copy each document as follows:
 - .1 Contract Drawings.
 - .2 Specifications.
 - .3 Addenda.
 - .4 LEED™ Documentation Binders
 - .5 Reviewed Shop Drawings.
 - .6 List of Outstanding Shop Drawings.
 - .7 Change Orders.
 - .8 Other Modifications to Contract.
 - .9 Field Test Report, System Components List complete with Commissioning Verification Forms and Check Sheets and Commissioning Issues/Resolution Log.
 - .10 Permits

- .11 Copy of Approved Work Schedule.
- .12 Health and Safety Plan and Other Safety Related Documents.
- .13 Daily weather log
- .14 Other documents as specified.

END OF SECTION

Part 1 General

1.1 Read and conform to Division 01 requirements and documents referred to therein.

1.2 ACCESS AND EGRESS

- .1 Design, construct and maintain temporary "access to" and "egress from" Work areas, including stairs, ramps or ladders and scaffolding, independent of finished surfaces and in accordance with relevant municipal, provincial and other regulations.

1.3 USE OF SITE AND FACILITIES

- .1 Execute Work with least possible interference or disturbance to normal use of premises. Make arrangements with Owner to facilitate Work as stated.
- .2 Maintain existing services to building and provide for personnel and vehicle access.
- .3 Where security is reduced by Work provide temporary means to maintain security.
- .4 Salt storage, garage and wash bays must be accessible and fully operational during ploughing season (Oct 1 to April 30).
- .5 Coordinate relocation of pressure washer with York Region. Provide minimum 1 week notice.
- .6 Contractor to ensure fuel station is accessible daily. Any restrictions to access of fuel station to be coordinated with York Region.
- .7 Contractor to ensure safe access to the site at all times.
- .8 Contractor to address potential conflicts between Contractor's vehicles and York Region's vehicles throughout construction.
- .9 Review Appendix E YRND – Proposed Phasing and coordinate work of that Section. Appendix E is included for general reference only; Contractor shall prepare suitable sequencing plan that achieves the intent of maintaining operations throughout construction.
- .10 Separate pedestrian and vehicle access for York Region staff and construction is preferred wherever possible. Where not possible, additional barriers, flagpersons, and safety measures will be required.
- .11 Site to remain fully operational throughout construction
- .12 Contractor to be responsible for ensuring contractor's work along with any closures, shutdowns, or disruptions are coordinated with York Region to mitigate operational impacts.
- .13 Contractor to be responsible for ensuring contractor's work does not impact safety of York Region staff

1.4 ALTERATIONS, ADDITIONS OR REPAIRS TO EXISTING BUILDING

- .1 Execute Work with least possible interference or disturbance to building operations, occupants, public and normal use of premises. Arrange with Consultant to facilitate execution of Work.

1.5 BUILDING SMOKING ENVIRONMENT

- .1 Comply with smoking restrictions.

Part 1 General

- .1 Read and conform to Division 01 requirements and documents referred to therein.

1.2 SUMMARY

- .1 Related Requirements:
 - .1 General Conditions and Supplementary Conditions of the Contract.

1.3 CASH ALLOWANCES

- .1 Include in Contract Price specified cash allowances.
- .2 Cash allowances, unless otherwise specified, cover net cost to Contractor and Subcontractor of services, Products, construction machinery and equipment, freight, handling, unloading, storage, installation and other authorized expenses incurred in performing Work.
- .3 Contract Price, and not cash allowance, includes Contractor's overhead and profit in connection with such cash allowance.
- .4 Contract Price will be adjusted by written order to provide for excess or deficit to each cash allowance.
- .5 Where costs under a cash allowance exceed amount of allowance, Contractor will be compensated for excess incurred and substantiated plus allowance for overhead and profit as set out in Contract Documents.
- .6 Include progress payments on accounts of Work authorized under cash allowances in Consultant's monthly certificate for payment.
- .7 Prepare schedule jointly with Consultant and Contractor to show when items called for under cash allowances must be authorized by Consultant for ordering purposes so that progress of Work will not be delayed.
- .8 Amount of each allowance, for Work specified in specification is as follows:
 - .1 Include allowance of \$550,000.00 for excavation, transportation, removal, backfill and disposal of unsuitable and contaminated material
 - .2 Include allowance of \$35,000.00 for Hydro-Vac services to expose unforeseen underground utilities.
 - .3 Include allowance of \$40,000.00 for relocating unforeseen existing underground service lines.
 - .4 Include allowance of \$200,000.00 for Inspection and Material Testing
 - .5 Include allowance of \$25,000.00 for Bell Conduits and Incoming Fibre Service in addition to the contract requirements
 - .6 Include allowance of \$40,000.00 for Hydro Connection Charges
 - .7 Include allowance of \$330,000.00 for unforeseen pumping and disposal of groundwater
 - .8 Include allowance of \$94,000.00 for supply and installation of up to 1,000 Tons of Granular A for Soft Spot Remediation
 - .9 Include allowance of \$5,000.00 for unforeseen designated substances removal where removal cannot be fully captured in contract documents, including reference documents (in soil and existing structure)

Part 1 General

- .1 Read and conform to Division 01 requirements and documents referred to therein.

1.2 ADMINISTRATIVE

- .1 Schedule and administer project meetings throughout the progress of the work and at the request of the Consultant.
- .2 Prepare agenda for meetings.
- .3 Distribute written notice of each meeting four Business Days in advance of meeting date to the Consultant.
- .4 Provide physical space and make arrangements for meetings and provide arrangements for virtual attendance (audio and video) when required by Owner or Consultant.
- .5 Preside over meetings.
- .6 Record meeting minutes. Include significant proceedings and decisions. Identify actions by parties.
- .7 Reproduce and distribute copies of minutes within three Business Days after meetings and transmit to meeting participants and affected parties not in attendance.
- .8 Representative of the Contractor, Subcontractor and suppliers attending meetings will be qualified and authorized to act on behalf of party each represents.

1.3 PRECONSTRUCTION MEETING (CONSTRUCTION PARTNERING WORKSHOP)

- .1 Promptly after award of the Contract, request a meeting of parties in contract to discuss and resolve administrative procedures and responsibilities.
- .2 Representatives of the Owner, the Consultant, the Contractor, major Subcontractors, suppliers listed in bid form, field inspectors and supervisors shall be in attendance.
- .3 Coordinate time and location of meeting and notify parties concerned minimum 5 Business Days before meeting.
- .4 Agenda to include:
 - .1 Appointment of official representative of participants in the Work.
 - .2 Schedule of Work: in accordance with Construction Progress Schedules and long lead times.
 - .3 Schedule of submission of shop drawings, samples, colour chips. Submit submittals in accordance with Section 01 33 00 - Submittal Procedures.
 - .4 Requirements for temporary facilities, site sign, offices, storage sheds, utilities, fences in accordance with Section 01 52 00 - Construction Facilities.
 - .5 Delivery schedule of specified equipment.
 - .6 Site security in accordance with Section 01 56 00 - Temporary Barriers and Enclosures.

- .7 Site requirements, coordination and restrictions in accordance with Appendix H – Site Restrictions.
- .8 Proposed changes, change orders, procedures, approvals required, mark-up percentages permitted, time extensions, overtime, administrative requirements.
- .9 Owner provided products and salvaged items as indicated on drawings.
- .10 Record drawings in accordance with Section 01 33 00 - Submittal Procedures.
- .11 Maintenance manuals in accordance with Section 01 78 00 - Closeout Submittals.
- .12 Take-over procedures, acceptance, warranties in accordance with Section 01 78 00 - Closeout Submittals.
- .13 Monthly progress claims, administrative procedures, photographs, hold backs.
- .14 Appointment of inspection and testing agencies or firms.
- .15 Insurances, transcript of policies.

1.4 PROGRESS MEETINGS

- .1 During course of Work schedule progress meetings every two weeks.
- .2 Contractor, major Subcontractors involved in Work, Consultant, and Owner are to be in attendance.
- .3 Notify parties minimum 5 Business Days prior to meetings.
- .4 Record minutes of meetings and circulate to attending parties and affected parties not in attendance within 7 Business Days after meeting.
- .5 Agenda to include the following:
 - .1 Review, approval of minutes of previous meeting.
 - .2 Review of Work progress since previous meeting.
 - .3 Field observations, problems, conflicts.
 - .4 Problems which impede construction schedule.
 - .5 Review of off-site fabrication delivery schedules.
 - .6 Corrective measures and procedures to regain projected schedule.
 - .7 Revision to construction schedule.
 - .8 Progress schedule, during succeeding work period.
 - .9 Review submittal schedules: expedite as required.
 - .10 Maintenance of quality standards.
 - .11 Review proposed changes for affect on construction schedule and on completion date.
 - .12 Other business.

1.1 GENERAL REQUIREMENTS

- .1 Read and conform to Division 01 requirements and documents referred to therein.

1.2 SUMMARY

- .1 Provide an experienced photographer with appropriate equipment to take photographs, edit and deliver for viewing online.
- .2 Provide progressive sets of photographs from the same location of the same view of the building to track progress, all photos must include a measuring tape for scaling and reference of components documented.
- .3 Provide time lapse sequential photographs and video of selected construction work as it progresses. Position a camera on Site prior to commencing Work on Site, at a birds eye view approved by Owner to capture images and time lapse videos. 2 submissions to be submitted: one at 50% and one at 100%.
- .4 Provide high concentration of photos take over shorter time frame of mock-ups for testing and inspection of construction methods as determined by Owner/Consultant.

1.3 SUBMITTALS

- .1 Schedule: Identify preset intervals to be on-site (i.e. First Tuesday of month) and additional special dates Consultant to be present (i.e, milestones, mock ups, commencement or completion)
- .2 Key Plan: Submit key plan showing building site and building interior plans with identification of vantage points for locations of photographer and view directions for photo sets. Label each site as it will be identified on online views.
- .3 Submit photographs at end of project and at each month end prior to request for progress payments, as a series of photos with comments on progress and set-backs/problems/corrections, in PDF format.

1.4 COPYRIGHT PRIVILEGES

- .1 Obtain and transfer or permit Owner complete image rights for unlimited reproduction and distribution of photographic documentation.

Part 2 Products

2.1 PHOTOGRAPHY

- .1 Submit monthly collection of photos (PDF of jpeg image) with month end report to Consultant and Owner.
- .2 Digital images, 'jpeg' format produced by a digital camera with minimum size of 2.0 megapixels and an image with not less than 1936x1296 resolution and 300 dpi.

2.2 INDEXING AND NAVIGATION

- .1 For each photographer location and view direction, compile photographs in chronological order from first photo to last photo of that shot.
- .2 Assemble shots to run as slide show (power point), sequentially by date and time, which can be stopped at any image or selected individually from folder.
- .3 Name and date slides so Owner can easily find photos of the building/construction.

Part 3 Execution

3.1 PROGRESSION PHOTOGRAPHIC SETS

- .1 Site sets: from predetermined locations around the site, recording:
 - .1 Complex construction locations.
 - .2 Major underground utilities
 - .3 Soils and sediment control.
 - .4 Blindside property line excavation, reinforcing drainage and concrete wall construction.
- .2 Exterior Wall Sets: from predetermined locations around site, recording:
 - .1 Outside progression of building envelope.
 - .2 Exterior key points such as front entrances, adjacent buildings, unique details.
 - .3 Pace of construction.
- .3 Interior Sets: at predetermined locations around site, recording:
 - .1 Progress of testing, commissioning, and balancing of HVAC, Plumbing, Electrical.
 - .2 Interior wall framing and finishing as requested.
 - .3 Installation of interior finishes millwork and details as requested.

3.2 SHORT TERM PHOTOGRAPHIC IMAGES

- .1 Photos to be taken as overlapping images of systems and installations focusing on details of interest, progress of work or importance to the client (confirm location as required by Consultant).
- .2 Detail photography to permanently record actual location of these systems for operation and maintenance purposes.

END OF SECTION

1.1 General

1.2 ADMINISTRATIVE REQUIREMENTS

- .1 Submit to Consultant submittals listed for review. Submit within 10 working days and in orderly sequence to not cause delay in Work. Failure to submit in ample time is not considered sufficient reason for extension of Contract Time and no claim for extension by reason of such default will be allowed.
- .2 Special submittals are required for LEED Certification. Refer to Section 01 33 01 and Section 01 61 00 for a full description of LEED reporting and submittal requirements for Contractors, Subcontractors, Suppliers and Manufacturers.
- .3 Submit to Consultant complete list of items that require warranties and their duration.
- .4 Do not proceed with Work affected by submittal until review is complete.
- .5 Present Shop Drawings, Product data, samples and mock-ups in SI Metric units.
- .6 Where items or information is not produced in SI Metric units converted values are acceptable.
- .7 Review submittals prior to submission to the Consultant. This review represents that necessary requirements have been determined and verified, or will be, and that each submittal has been checked and co-ordinated with requirements of Work and Contract Documents. Submittals not stamped, signed, dated and identified as to specific Project will be returned without being examined and considered rejected.
- .8 Notify the Consultant in writing at time of submission, identifying deviations from requirements of Contract Documents stating reasons for deviations.
- .9 Verify field measurements and affected adjacent Work are co-ordinated.
- .10 Contractor's responsibility for errors and omissions in submission is not relieved by Consultant's review of submittals.
- .11 Contractor's responsibility for deviations in submission from requirements of Contract Documents is not relieved by Consultant review.
- .12 Keep one reviewed copy of each submission on Site.

1.3 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Product Data / Shop Drawings
 - .1 The term "Shop Drawings" means Drawings, diagrams, illustrations, schedules, performance charts, brochures and other data which are to be provided by Contractor to illustrate details of a portion of Work.
 - .2 Submit Shop Drawings bearing stamp and signature of qualified professional engineer registered or licensed in Province of the Work as required. The Professional Engineer shall be responsible for reviewing the method of seismic restraint and attachment to the structure with the Consultant prior to installation. The Professional Engineer shall also provide field and certification of installation at Sub-contractor's cost.
 - .3 Particular consideration shall be given in the design of seismic restraint anchorage to areas of the structure. Attachment of seismic restraint to

the building structure must be reviewed and accepted by the Owner's Structural Consultant. The Subcontractor shall submit seismic restraint calculations upon request for review by the Consultant. Consider this article the minimum requirement. Further instruction contained in any particular Specification Section governs for that section of the Work.

- .4 Indicate materials, methods of construction and attachment or anchorage, erection diagrams, connections, explanatory notes and other information necessary for completion of Work. Where articles or equipment attach or connect to other articles or equipment, indicate that such items have been co-ordinated, regardless of Section under which adjacent items will be supplied and installed. Indicate cross references to design Drawings and Specifications.
- .5 Submit Shop Drawings showing details of seismic restraint of architectural systems and finishes, and mechanical, plumbing and electrical equipment and associated installations, shall include the approximate weight of the item to be restrained.
- .6 Allow 10 Working Days for Consultant's review of each submission.
- .7 Adjustments made on Shop Drawings by Consultant are not intended to change Contract Price. If adjustments affect value of Work, state such in writing to Consultant prior to proceeding with Work.
- .8 Make changes in Shop Drawings as Consultant may require, consistent with Contract Documents. When resubmitting, notify Consultant in writing of revisions other than those requested.
- .9 Accompany submissions with transmittal letter containing:
 - .1 Date.
 - .2 Project title and number.
 - .3 Contractor's name and address.
 - .4 Identification and quantity of each shop drawing, Product data and sample.
 - .5 Other pertinent data.
- .10 Submissions include:
 - .1 Date and revision dates.
 - .2 Project title and number.
 - .3 Name and address of:
 - .1 Subcontractor.
 - .2 Supplier.
 - .3 Manufacturer.
 - .4 Contractor's stamp, signed by Contractor's authorized representative certifying approval of submissions, verification of field measurements and compliance with Contract Documents.
 - .5 Details of appropriate portions of Work as applicable:
 - .1 Fabrication.
 - .2 Layout, showing dimensions, including identified field dimensions, and clearances.
 - .3 Setting or erection details.
 - .4 Capacities.

- .5 Performance characteristics.
- .6 Standards.
- .7 Operating weight.
- .8 Wiring diagrams.
- .9 Single line and schematic diagrams.
- .10 Relationship to adjacent Work.
- .11 After Consultant's review, distribute copies.
- .12 Submit electronic copy of Shop Drawings for each requirement requested in Specification Sections and as Consultant may reasonably request.
- .13 Submit electronic copies of Product data sheets or brochures for requirements requested in Specification Sections and as requested by Consultant where Shop Drawings will not be prepared due to standardized manufacture of Product.
- .14 Submit electronic copies of test reports for requirements requested in Specification Sections and as requested by Consultant.
 - .1 Report signed by authorized official of testing laboratory that material, Product or system identical to material, Product or system to be provided has been tested in accord with specified requirements.
 - .2 Testing must have been conducted within 3 years of date of Contract award.
- .15 Submit electronic copies of certificates for requirements requested in Specification Sections and as requested by Consultant.
 - .1 Statements printed on manufacturer's letterhead and signed by responsible officials of manufacturer of Product, system or material attesting that Product, system or material meets Specification requirements.
 - .2 Certificates must be dated after award of Project Contract complete with Project name.
- .16 Submit electronic copies of manufacturers instructions for requirements requested in Specification Sections and as requested by Consultant.
 - .1 Pre-printed material describing installation of Product, system or material, including special notices and WHMIS Safety Data Sheets concerning impedances, hazards and safety precautions.
- .17 Submit electronic copies of Manufacturer's Field Reports for requirements requested in Specification Sections and as requested by Consultant.
 - .1 Documentation of the testing and verification actions taken by manufacturer's representative to confirm compliance with manufacturer's standards or instructions.
- .18 Submit electronic copies of Operation and Maintenance Data for requirements requested in Specification Sections and as requested by Consultant.
- .19 Delete information not applicable to Project.
- .20 Supplement standard information to provide details applicable to Project.
- .21 If upon review by Consultant, no errors or omissions are discovered or if only minor corrections are made, copies will be returned and fabrication

and installation of Work may proceed. If Shop Drawings are rejected, noted copy will be returned and resubmission of corrected Shop Drawings, through same procedure indicated above, must be performed before fabrication and installation of Work may proceed.

.22 Samples:

- .1 Submit for review samples in duplicate as requested in respective Specification Sections. Label samples with origin and intended use.
- .2 Deliver samples prepaid to Consultant's business address.
- .3 Notify Consultant in writing, at time of submission of deviations in samples from requirements of Contract Documents.
- .4 Where colour, pattern or texture is criterion, submit full range of samples.
- .5 Adjustments made on samples by Consultant are not intended to change Contract Price. If adjustments affect value of Work, state such in writing to Consultant prior to proceeding with Work.
- .6 Make changes in samples which Consultant may require, consistent with Contract Documents.
- .7 Reviewed and accepted samples will become standard of workmanship and material against which installed Work will be verified.

1.4 QUALITY ASSURANCE

.1 Mock-Ups:

- .1 Erect mock-ups in accordance with 01 45 00 - Quality Control.

.2 Photographs: Digital Format as indicated in Section 01 32 33 – Photographic Documentation.

.3 Certificates and Transcripts:

- .1 Immediately after award of Contract, submit WSIB Certificate of Clearance.
- .1 Submit transcription of insurance immediately after award of Contract.

09 21 16	GYPSUM WALLBOARD ASSEMBLIES	X		
	LEED: with the VOC Emissions Evaluation requirements as per Section 01 81 19	X	Low-emitting materials	VOC Emissions evaluation in accordance with California Department of Public Health (CDPH) Standard Method v1.1–2010, using the applicable exposure scenario.
	If applicable, Material Ingredient Reporting Information (Declare label, Cradle to Cradle, H	X	Material Ingredients	Manufacturers inventory, Declare, Cradle to Cradle, HPD, etc.
	Submit products' cost or surface area as per section 01 81 19 for all the gypsum wallboard products applied on site.	X	Sourcing of Raw Materials & Low-Emitting Materials	For criteria incl. recycled content, FSC, CSR reports, etc.
	If available, Product-Specific Declaration (conforming to ISO 14044), an Industry wide Type III EPD or Product-Specific Type III EPD (conforming to ISO 14025, and EN 15804 or ISO 21930) for metal for LEED compliance	X	Environmental Product Declarations	EPD must be valid during construction.
	Detailed Shop Drawings	X	Sourcing of Raw Materials & Low-Emitting Materials, Material Ingredients, EPDs	
09 30 13	TILING	X		
	Submit products' cost or surface area as per section 01 81 19 for floor products applied on site.		Sourcing of Raw Materials	For criteria incl. recycled content, FSC, CSR reports, etc.
	If applicable, Material Ingredient Reporting Information (Declare label, Cradle to Cradle, H	X	Material Ingredients	Manufacturers inventory, Declare, Cradle to Cradle, HPD, etc.
	If available, Product-Specific Declaration (conforming to ISO 14044), an Industry wide Type III EPD or Product-Specific Type III EPD (conforming to ISO 14025, and EN 15804 or ISO 21930) for metal for LEED compliance	X	Environmental Product Declarations	EPD must be valid during construction.
	Shop drawings (location and details of control joints)	X	EPDs, Sourcing of Raw Materials, Material Ingredients, Low Emitting Materials	
	Certification: Certified copies of test reports from accredited testing agency for VOC emissions evaluation	X	Low Emitting Materials	VOC Emissions evaluation in accordance with California Department of Public Health (CDPH) Standard Method v1.1–2010, using the applicable exposure scenario.
09 51 13	ACOUSTICAL PANEL CEILINGS	X		

	Manufacturer's certification for the ceiling materials compliance with the VOC Emissions Evaluation requirements as per Section 01 81 19	X	Low-emitting materials	VOC Emissions evaluation in accordance with California Department of Public Health (CDPH) Standard Method v1.1–2010, using the applicable exposure scenario.
	Submit products' cost or surface area as per section 01 81 19 for all ceiling materials products applied on site.	X	Sourcing of Raw Materials & Low-Emitting Materials	For criteria incl. recycled content, FSC, CSR reports, etc.
	If applicable, Material Ingredient Reporting Information (Declare label, Cradle to Cradle, H	X	Material Ingredients	Manufacturers inventory, Declare, Cradle to Cradle, HPD, etc.
	If available, Product-Specific Declaration (conforming to ISO 14044), an Industry wide Type III EPD or Product-Specific Type III EPD (conforming to ISO 14025, and EN 15804 or ISO 21930) for metal for LEED compliance	X	Environmental Product Declarations	EPD must be valid during construction.
09 65 00	RESILIENT FLOORING	X		
	Submit products' cost or surface area as per section 01 81 19 for floor products applied on site.	X	Sourcing of Raw Materials & Low-Emitting Materials	For criteria incl. recycled content, FSC, CSR reports, etc.
	If available, Product-Specific Declaration (conforming to ISO 14044), an Industry wide Type III EPD or Product-Specific Type III EPD (conforming to ISO 14025, and EN 15804 or ISO 21930) for metal for LEED compliance	X	Environmental Product Declarations	EPD must be valid during construction.
	Manufacturer's certification for flooring materials showing compliance with the VOC Emissions Evaluation, requirements as per Section 01 81 19	X	Low-emitting materials	VOC Emissions evaluation in accordance with California Department of Public Health (CDPH)
09 72 00	VINYL FILMS	X		
	Submit products' cost or surface area as per section 01 81 19 for products applied on site.	X	Sourcing of Raw Materials & Low-Emitting Materials	For criteria incl. recycled content, FSC, CSR reports, etc.
	Manufacturer's certification showing compliance with the VOC Emissions Evaluation, requirements as per Section 01 81 19	X	Low-emitting materials	VOC Emissions evaluation in accordance with California Department of Public Health (CDPH) Standard Method v1.1–2010, using the applicable exposure scenario.
	If available, Product-Specific Declaration (conforming to ISO 14044), an Industry wide Type III EPD or Product-Specific Type III EPD (conforming to ISO 14025, and EN 15804 or ISO 21930) for metal for LEED compliance	X	Environmental Product Declarations	EPD must be valid during construction.
	If applicable, Material Ingredient Reporting Information (Declare label, Cradle to Cradle, H	X	Material Ingredients	Manufacturers inventory, Declare, Cradle to Cradle, HPD, etc.
09 91 00	PAINTING	X		
	Submit products' cost or surface area as per section 01 81 19 for products applied on site.	X	Sourcing of Raw Materials & Low-Emitting Materials	For criteria incl. recycled content, FSC, CSR reports, etc.
	If available, Product-Specific Declaration (conforming to ISO 14044), an Industry wide Type III EPD or Product-Specific Type III EPD (conforming to ISO 14025, and EN 15804 or ISO 21930) for metal for LEED compliance	X	Environmental Product Declarations	EPD must be valid during construction.
	If applicable, Material Ingredient Reporting Information (Declare label, Cradle to Cradle, H	X	Material Ingredients	Manufacturers inventory, Declare, Cradle to Cradle, HPD, etc.
	Manufacturer's certification showing solar reflectance levels for asphalt coating	X	Heat Island Reduction	Should provide proof of initial SR value of at least 0.33.
	Manufacturer's certification for the painting materials compliance with the VOC Emissions Evaluation and VOC content limits, requirements as per Section 01 81 19.	X	Low-emitting materials	VOC Emissions evaluation in accordance with California Department of Public Health (CDPH) Standard Method v1.1–2010, using the applicable exposure scenario. VOC content limits under the California Air Resources Board (CARB) 2007, Suggested Control Measure (SCM) for Architectural Coatings, or the South Coast Air Quality Management District (SCAQMD) Rule 1113, effective June 3, 2011.

Part 1 General

1.1 GENERAL REQUIREMENTS

- .1 Read and conform to Division 01 requirements and documents referred to therein.

1.2 INTENT

- .1 The intent of Delegated Design Submittals required by this Section is to account for professional engineering responsibility for design, review and acceptance of components of Work forming a part of permanent Work in accordance with the Ontario Building Code, and that has been assigned to a design entity other than Consultant including, but not limited to, the following:
 - .1 Design requiring structural analysis of load bearing components and connections and seismic requirements.
 - .2 Design requiring compliance with fire safety regulations.
 - .3 Design requiring compliance with life or health safety regulations.
 - .4 Materials and systems located in sections as indicated below.
- .2 This Section provides standard forms for submittal of Letter of Commitment and Letter of Compliance required complying with requirements of Building Code and design delegated to a Professional Engineer within technical specification Sections.
- .3 Delegated Design Submittals are not required for components of Work requiring engineering for temporary Work (i.e.: crane hoisting, engineered lifts, false Work, shoring, concrete formwork) that would normally form a part of Contractor's scope of Work.
- .4 The requirements of this section are in general conformance with recommended Practice Guidelines and Guideline to Professional Practice and Code of Ethics published by Professional Engineers Ontario (PEO), with regards to duties of specialty professionals appointed during construction period.
- .5 The requirements of this Section do not diminish responsibilities of Consultant's role as Registered Professional of Record; submittals will be used by Consultant to establish that Work is substantially performed in accordance with Building Code.

1.3 RELATED REQUIREMENTS

- .1 Technical Sections as indicated.
- .2 Divisions 21 through 28 - Coordinate with disciplines for items requiring delegated design submittals.
- .3 Coordinate additional items with disciplines for items requiring delegated design submittals.

1.4 DELEGATED DESIGN

- .1 Performance and Design Criteria: Provide products and systems complying with specific performance and design criteria indicated where professional design services or certifications by a design professional are specifically required of Contractor by Contract Documents.

- .2 If criteria indicated are not sufficient to perform services or certification required, submit a written request for additional information to Consultant.
- .3 Delegated design will be required for elements designed by a specialty professional, which may include:
 - .1 Elements normally fabricated off-site
 - .2 Elements that require specialized fabrication equipment or a proprietary fabrication process not usually available at job Site (i.e.: guardrails, handrails, open web steel joists, wood trusses, combination wood and metal or plywood joists, prefabricated wood or metal buildings, noise and vibration isolation devices, elevators).
 - .3 Elements requiring civil engineering, not normally a part of scope of services performed by architectural; structural; mechanical; electrical; or geotechnical disciplines of Consultant.

Part 2 Products

2.1 CERTIFICATE OF AUTHORIZATION

- .1 The PEO Certificate of Authorization allows individual professional engineers acting as independent contractors or companies to offer or provide professional engineering services directly to the public. Certificate of Authorization holders must stamp their work to indicate their responsibility for the services provided. For Professional Engineers acting as independent contractors or companies, Submit Certificate of Authorization at same time as submission of Letter of Commitment.

2.2 LETTER OF COMMITMENT

- .1 Submit a signed and sealed Letter of Commitment on company letterhead addressed to Consultant in accordance with format in Appendix A attached to the end of this Section prior to starting Work requiring design and seal of a professional engineer.

2.3 LETTER OF COMPLIANCE

- .1 Submit a signed and sealed Letter of Compliance on company letterhead addressed to Consultant in accordance with format in Appendix B attached to the end of this Section on completion of Work requiring design and seal of a professional engineer.

Part 3 Execution

3.1 IMPLEMENTATION

- .1 Include summary of Work described in technical specification Section as a part of the required Letter of Commitment.
- .2 Prepare required submittals and present to Consultant within sufficient time to allow for Consultant's detailed review and acceptance.

3.2 SUPPLEMENTS

- .1 The documents listed below, attached following "END OF SECTION", form part of this Specification Section:
 - .1 Appendix A – Letter of Commitment
 - .2 Appendix B - Letter of Compliance
 - .3 Section 01 35 22 100% DD LEED Scorecard

END OF SECTION

APPENDIX A

LETTER OF COMMITMENT

Submit a signed and sealed letter of commitment on company letterhead in the form as follows:

[Date]

[Consultant]

[Consultant's Address]

Attention: [Consultant's Registered Professional of Record]

Re: Letter of Commitment for Delegated Design of [System of Component of Work]
[Name of Project]
[Project Number]
[City, Province]

As the retained registered professional engineer for design and field review of the above named component of Work and project, I hereby give assurance I am qualified to perform the following Work as required by Contract Documents:

1. [List appropriate design services for System or Component of Work];
2. Preparation of shop and erection documents;
3. Review fabrication of [structural] [fire rated] [life and health safety] components;
4. Review erection of [structural] [fire rated] [life and health safety] components.
5. [Modify list to suit System of Component of Work.]

I hereby give assurance that I will be responsible for above noted Work as described in Project Manual, including requirements of addenda, change orders and change directives.

I also undertake to be responsible for field review of fabrication and erection of [structural] [fire rated] [life and health safety] components as required to ascertain substantial compliance with the Building Code and Contract Documents.

I will notify you in writing if my responsibility is terminated at any time during the course of Work covered by this Letter of Commitment.

Retained Professional Engineer

APPENDIX B

LETTER OF COMPLIANCE

[Date]

[Consultant]

[Consultant's Address]

Attention: [Consultant's Registered Professional of Record]

Re: Letter of Compliance for Delegated Design of [System of Component of Work]
[Name of Project]
[Project Number]
[City, Province]

I hereby give assurance that I have fulfilled my obligations for field review as outlined by previously submitted Letter of Commitment.

I hereby give assurance that aspects of [structural] [life and health safety] Work as defined by previously submitted Letter of Commitment substantially comply with Contract Documents and Building Code.

Retained Professional Engineer

Part 1 General

1.1 GENERAL REQUIREMENTS

- .1 Read and conform to Division 01 requirements and documents referred to therein.

1.2 REFERENCES

- .1 Reference Standards:
 - .1 Canada Labour Code, Part 2, Canada Occupational Safety and Health Regulations, most current edition
 - .2 Health Canada/Workplace Hazardous Materials Information System (WHMIS):
 - .1 Safety Data Sheets (SDS).
 - .3 Province of Ontario:
 - .1 Ontario Occupational Health and Safety Act and Regulations, most current edition

1.3 ACTIVE SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Make submittals in accordance with Section 01 33 00 Submittal Procedures.
- .2 Submit Site Specific Health and Safety Plan: Within 7 days after date of Notice to Commence the Work and prior to commencement of the Work. Health and Safety Plan must include:
 - .1 Results of site specific safety hazard assessment.
 - .2 Results of safety and health risk or hazard analysis for site tasks and operation found in Work plan.
- .3 Submit 2 copies of Contractor's authorized representative's Work site health and safety inspection reports to Consultant and Authority Having Jurisdiction, weekly.
- .4 Submit copies of reports or directions issued by Federal and Provincial health and safety inspectors.
- .5 Submit copies of incident and accident reports.
- .6 Submit WHMIS SDS - Safety Data Sheets.
- .7 Consultant will review Contractor's Site Specific Health and Safety Plan and provide comments to Contractor within 7 days after receipt of plan. Revise plan as appropriate and resubmit plan to Consultant within 7 days after receipt of comments from Consultant.
- .8 Consultant's review of Contractor's final Health and Safety plan should not be construed as approval and does not reduce the Contractor's overall responsibility for construction Health and Safety.
- .9 Medical Surveillance: where prescribed by legislation, regulation or safety program, submit certification of medical surveillance for site personnel prior to commencement of Work, and submit additional certifications for any new site personnel to Consultant.

- .10 On-site Contingency and Emergency Response Plan: address standard operating procedures to be implemented during emergency situations.

1.4 FILING OF NOTICE

- .1 File Notice of Project with Provincial authorities prior to beginning of Work.

1.5 SAFETY REQUIREMENTS

- .1 Contractor shall verify that emergency procedures including appropriate First Aid facilities and First Aid personnel are in place at the Work Site.
- .2 Contractor shall also have access to the Owner's First Aid Facilities. Conditions for use will be reviewed at the Project Start-up Meeting.
- .3 Contractor shall employ a full time, on-site Construction Safety Officer (CSO) who is responsible for the following:
 - .1 Providing new employee orientation
 - .2 Overseeing site activities
 - .3 Providing appropriate training on personal protective equipment and Workplace Hazardous Materials Information System (WHMIS)
 - .4 Conducting and documenting accident investigations as required
 - .5 Conducting daily Work site inspections
 - .6 Conducting weekly site safety meetings, train new employees and verifying that Subcontractors, Sub-Subcontractors, Suppliers and others working on the site are aware of safety requirements
 - .7 Requirement for a full time, on-site CSO may be waived where it can be shown that the site superintendent is certified and trained to act as the Safety Officer or the number of workers is below the requirement for a CSO.
 - .8 CSO shall be certified by a training program recognized by the Ontario Construction Safety Association.
- .4 Maintain on site sufficient quantities of PPE, including but not limited to: hard hats, safety glasses, hearing protection and other items of clothing or special equipment as necessary to verify that visitors to the site, the Consultant and the Owner's representative are adequately protected.
- .5 Provide training and instruction to occupants of adjacent buildings being added to or renovated, and forming a part of the Work of this Contract, about the dangers involved with entering the Work site prior to working on site:
 - .1 Provide educational materials, brochures or pamphlets as a part of the training session.
 - .2 Provide training sessions prior to the start of Work, to verify that knowledge of construction site hazards is reinforced and maintained.
- .6 Verify that all Contractor's employees, Subcontractors, Sub-Subcontractors, Suppliers and others working on the site, meet clothing requirements in accordance with all applicable occupational health and safety laws and requirements.

1.6 MEETINGS

- .1 Schedule and administer health and safety meeting with Consultant and Owner prior to commencement of Work.

1.7 REGULATORY REQUIREMENTS

- .1 Perform Work in accordance with Section 01 41 00 Regulatory Requirements.

1.8 GENERAL REQUIREMENTS

- .1 Develop written Site Specific Health and Safety Plan based on hazard assessment prior to beginning site Work and continue to implement, maintain, and enforce plan until final demobilization from site. Health and Safety Plan must address Project Specifications.
- .2 Consultant may respond in writing, where deficiencies or concerns are noted and may request resubmission with correction of deficiencies or concerns.

1.9 RESPONSIBILITY

- .1 Be responsible for health and safety of persons on Site, safety of property on Site and for protection of persons adjacent to site and environment to extent that they may be affected by conduct of Work.
- .2 Comply with and enforce compliance by employees with safety requirements of Contract Documents, applicable federal, provincial, territorial and local statutes, regulations, and ordinances, and with Site-Specific Health and Safety Plan.

1.10 COMPLIANCE REQUIREMENTS

- .1 Comply with Ontario Occupational Health and Safety Act and Regulations.
- .2 York Region Health and Safety Guide for Construction Contractors

1.11 UNFORESEEN HAZARDS

- .1 When unforeseen or peculiar safety related factor, hazard, or condition occur during performance of Work, follow procedures in place for Employee's Right to Refuse Work in accordance with Acts and Regulations of Authorities Having Jurisdiction and advise the Consultant verbally and in writing. Refer to 00 30 00 Information Documents listing applicable reports:
 - .1 Designated Substances and Hazardous Materials Survey dated November 2, 2020, prepared by ECOH Environmental Consulting Occupational Health

1.12 DESIGNATED SUBSTANCES SURVEY DATED JULY 12, 2024, PREPARED BY LEAP MANAGEMENT INC.CONSTRUCTOR

- .1 The Contractor shall, for the purposes of the *Occupational Health and Safety Act*, and for the duration of the Work of this Contract:
 - .1 Be the "Constructor " for the "Work Site", and
 - .2 Meet all requirements of the *Occupational Health and Safety Act* and Regulations, Workers Compensation Board legislation, the Fire Code legislation and all other applicable laws that govern Workplace safety.

- .3 The Contractor shall direct all Subcontractors, Sub-Subcontractors, Other Contractors, employees, Suppliers, workers and any other persons at the "Work Site" on safety related matters, to the extent required to fulfill its "Constructor" responsibilities pursuant to the Act, regardless of:
 - .1 Whether or not any contractual relationship exists between the Contractor and any of these entities, and
 - .2 Whether or not such entities have been specifically identified in this Contract.
- .4 Safety Certification: Safety certification is a condition of Contract award; Contractor is required to comply with GC 9.8 Certificate of Recognition (COR™) Safety Program for the duration of the Work of this Contract.

1.13 POSTING OF DOCUMENTS

- .1 Ensure applicable items, articles, notices and orders are posted in conspicuous location on site in accordance with Acts and Regulations of Province having jurisdiction, and in consultation with Consultant.

1.14 CORRECTION OF NON-COMPLIANCE

- .1 Immediately address health and safety non-compliance issues identified by Authority Having Jurisdiction or by Consultant.
- .2 Provide Consultant with written report of action taken to correct non-compliance of health and safety issues identified.
- .3 Consultant may stop Work if non-compliance of health and safety regulations is not corrected.

1.15 BLASTING

- .1 Blasting or other use of explosives is not permitted without prior receipt of written instruction by Authority Having Jurisdiction.

1.16 POWDER ACTUATED DEVICES

- .1 Use powder actuated devices only after receipt of written permission from Authority Having Jurisdiction.

1.17 WORK STOPPAGE

- .1 Give precedence to safety and health of public and site personnel and protection of environment over cost and schedule considerations for Work.

Part 2 Products

2.1 NOT USED

Part 3 Execution

3.1 NOT USED

END OF SECTION

Part 1 General

1.1 GENERAL REQUIREMENTS

- .1 Read and conform to Division 01 requirements and documents referred to therein.

1.2 REFERENCES

- .1 Definitions:
 - .1 Environmental Pollution and Damage: presence of chemical, physical, biological elements or agents which adversely affect human health and welfare; unfavourably alter ecological balances of importance to human life; affect other species of importance to humankind; or degrade environment aesthetically, culturally and/or historically.
 - .2 Environmental Protection: prevention/control of pollution and habitat or environment disruption during construction. Control of environmental pollution and damage requires consideration of land, water, and air; biological and cultural resources; and includes management of visual aesthetics; noise; solid, chemical, gaseous, and liquid waste; radiant energy and radioactive material as well as other pollutants.

1.3 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Submittals: in accordance with Section 01 33 00 - Submittal Procedures.
- .2 Prior to commencing construction activities or delivery of materials to site, submit Environmental Protection Plan for review by Consultant Environmental Protection Plan is to present comprehensive overview of known or potential environmental issues which must be addressed during construction.
- .3 Address topics at level of detail commensurate with environmental issue and required construction tasks.
- .4 Environmental protection plan, include:
 - .1 Names of persons responsible for ensuring adherence to Environmental Protection Plan.
 - .2 Names and qualifications of persons responsible for manifesting hazardous waste to be removed from site.
 - .3 Names and qualifications of persons responsible for training site personnel.
 - .4 Descriptions of environmental protection personnel training program.
 - .5 Erosion and sediment control plan as per LEED requirements.
 - .6 Drawings showing locations of proposed temporary excavations or embankments for haul roads, stream crossings, material storage areas, structures, sanitary facilities, and stockpiles of excess or spoil materials including methods to control runoff and to contain materials on site.
 - .7 Traffic control plans including measures to reduce erosion of temporary roadbeds by construction traffic, especially during wet weather. Plans include measures to minimize amount of mud transported onto paved public roads by vehicles or runoff.

- .8 Work area plan showing proposed activity in each portion of area and identifying areas of limited use or non-use. Plan to include measures for marking limits of use areas including methods for protection of features to be preserved within authorized Work areas.
- .9 Spill Control Plan: including procedures, instructions, and reports to be used in event of unforeseen spill of regulated substance.
- .10 Non-Hazardous solid waste disposal plan identifying methods and locations for solid waste disposal including clearing debris.
- .11 Air pollution control plan detailing provisions to assure that dust, debris, materials, and trash, do not become air borne and travel off Project site.
- .12 Contaminant prevention plan that: identifies potentially hazardous substances to be used on job site; identifies intended actions to prevent introduction of such materials into air, water, or ground; and details provisions for compliance with Federal, Provincial, and Municipal laws and regulations for storage and handling of these materials.
- .13 Wastewater management plan that identifies methods and procedures for management and/or discharge of waste waters which are directly derived from construction activities, such as concrete curing water, clean-up water, dewatering of ground water, disinfection water, hydrostatic test water, and water used in flushing of lines.

1.4 FIRES

- .1 Fires and burning of rubbish on site not permitted.

1.5 DISPOSAL OF WASTES

- .1 Strictly adhere to requirements of Section 01 74 19 - Construction Waste Management. Do not bury rubbish and waste materials on site unless approved by Consultant.
- .2 Do not dispose of waste or volatile materials, such as mineral spirits, oil or paint thinner into waterways, storm or sanitary sewers.

1.6 DRAINAGE

- .1 Provide erosion and sediment control plan that identifies type and locations of erosion and sediment controls to be provided. Plan: include monitoring and reporting requirements to assure that control measure are in compliance with erosion and sediment control plan, Federal, Provincial, and Municipal laws and regulations.
- .2 Storm Water Pollution Prevention Plan (SWPPP) to be substituted for erosion and sedimentations control plan.
- .3 Provide temporary drainage and pumping as necessary to keep excavations and site free from water.
- .4 Do not pump water containing suspended materials into waterways or drainage systems. Migration to water retention pond is allowed.
- .5 Control disposal or runoff of water containing suspended materials or other harmful substances in accordance with local authority requirements.

1.7 SITE CLEARING AND PLANT PROTECTION

- .1 Protect trees and plants on site and adjacent properties where indicated on Drawings and in Specifications.
- .2 Wrap in burlap, trees and shrubs adjacent to construction Work, storage areas and trucking lanes, and encase with protective wood framework from grade level to height of 2 m.
- .3 Protect roots of designated trees to dripline during excavation and site grading to prevent disturbance or damage. Avoid unnecessary traffic, dumping and storage of materials over root zones.
- .4 Minimize stripping of topsoil and vegetation.
- .5 Restrict tree removal to areas indicated or designated by Consultant.

1.8 WORK ADJACENT TO WATERWAYS

- .1 Do not operate Construction Equipment in waterways.
- .2 Do not use waterway beds for borrow material.
- .3 Do not dump excavated fill, waste material or debris in waterways.
- .4 Design and construct temporary crossings to minimize erosion to waterways.
- .5 Do not skid logs or construction materials across waterways.
- .6 Avoid indicated spawning beds when constructing temporary crossings of waterways.
- .7 Do not blast under water or within 100 m of indicated spawning beds.

1.9 POLLUTION CONTROL

- .1 Maintain temporary erosion and pollution control features installed under this Contract.
- .2 Control emissions from equipment and plant to local authorities' emission requirements.
- .3 Prevent sandblasting and other extraneous materials from contaminating air and waterways beyond application area, by providing temporary enclosures.
- .4 Cover or wet down dry materials and rubbish to prevent blowing dust and debris. Provide dust control for temporary roads.

1.10 NOTIFICATION

- .1 Consultant will notify Contractor in writing of observed noncompliance with Federal, Provincial or Municipal environmental laws or regulations, permits, and other elements of Contractor's Environmental Protection plan.
- .2 Contractor: after receipt of such notice, inform Consultant of proposed corrective action and take such action for review by Consultant.
- .3 Consultant will issue stop order of work until satisfactory corrective action has been taken.
- .4 No time extensions granted or equitable adjustments allowed to Contractor for such suspensions.

.2 Specified standards, codes and referenced documents.

1.2 REFERENCES

.1 Reference Standards:

.1 Ontario Building Code 2024

.2 Canadian Standards Association (CSA Group):

.1 CSA B651:23, Accessible Design for the Built Environment
including amendments up to tender closing date and other codes
of provincial or local application. In case of conflict or discrepancy,
more stringent requirements apply.

Part 2 Products

2.1 NOT USED

Part 3 Execution

3.1 NOT USED

END OF SECTION

Part 1 General

1.1 GENERAL REQUIRMENTS

- .1 Read and conform to Division 01 requirements and documents referred to therein.

1.2 REFERENCES

- .1 Canadian Construction Documents Committee (CCDC)
 - .1 CCDC 2 -2020, Stipulated Price Contract as amended in the Contract Documents.
- .2 Underwriters' Laboratories of Canada (ULC)
 - .1 CAN/ULC-S1001-11, Standard for Integrated Systems Testing of Fire Protection and Life Safety Systems

1.3 INSPECTION/FIELD REVIEW

- .1 Refer to CCDC 2 -2020, Stipulated Price Contract, as amended in the Contract Documents.
- .2 Allow Consultant access to Work. If part of Work is in preparation at locations other than Place of Work, allow access to such Work whenever it is in progress.
- .3 Give minimum 8 Days prior notice requesting inspection if Work is designated for special tests, inspections or approvals by Contract Documents, Consultant's instructions, or law of Place of Work.
- .4 If Contractor covers or permits to be covered Work that has been designated for special tests, inspections or approvals before such is made, uncover such Work, have inspections or tests satisfactorily completed and make good such Work.
- .5 Consultant will order part of Work to be examined if Work is suspected to be not in accordance with Contract Documents. If, upon examination such work is found not in accordance with Contract Documents, correct such Work and pay cost of examination and correction. If such Work is found in accordance with Contract Documents, Owner shall pay cost of examination and replacement.

1.4 INDEPENDENT INSPECTION AGENCIES

- .1 Independent Inspection/Testing Agencies will be engaged by the Consultant for purpose of inspecting and/or testing portions of Work. Cost of such services will be paid through Cash Allowance Item CA4.
- .2 Where individual sections specifically indicate that certain inspections, tests and other quality control services are the Owner's responsibility, the Owner will employ and pay a qualified independent inspection/testing agency to perform those services.
- .3 Contractor shall provide inspections, tests and other quality control services, specified in the Contract Documents or required by the Authorities Having Jurisdiction unless otherwise indicated in the Contract Documents as the responsibility of the Owner. Employ and pay for a qualified independent inspection/testing agency to perform quality control services.

- .4 Provide notification to the Owner 5 Business Days prior to requiring Owner employed inspections or tests. The Owner will arrange for the inspection or testing agency to complete quality control services as required by specification sections. Owner will provide prior notice of 2 Business Days to the Contractor of dates inspections and tests are to be completed.
- .5 The Owner shall provide the Contractor a list of Owner employed inspection and testing agencies. The Contractor will arrange inspections and testing directly with independent agencies as required to conform to the construction schedule. Contractor will provide prior notice of 2 Business Days to the Owner of dates inspections and tests are to be completed.
- .6 Provide equipment required for executing inspection and testing by appointed agencies.
- .7 Employment of inspection/testing agencies does not relax responsibility to perform Work in accordance with Contract Documents.
- .8 If defects are revealed during inspection or testing, appointed agency will request additional inspection or testing to ascertain full degree of defect. Correct defect and irregularities as advised by Consultant at no cost to Owner. Pay costs for retesting and reinspection.

1.5 ACCESS TO WORK

- .1 Allow inspection/testing agencies access to Work, off Site manufacturing and fabrication plants.
- .2 Co-operate to provide reasonable facilities for such access.

1.6 PROCEDURES

- .1 Notify appropriate agency in advance of requirement for tests, in order that attendance arrangements can be made.
- .2 Submit samples or materials required for testing, as specifically requested in Specifications. Submit with reasonable promptness and in orderly sequence to not cause delays in Work.
- .3 Provide labour and facilities to obtain and handle samples and materials on Site. Provide sufficient space to store and cure test samples.

1.7 REJECTED WORK

- .1 Refer to CCDC 2 CCDC 2-2020, Stipulated Price Contract, as amended in the Contract Documents.
- .2 Remove defective Work, whether result of poor workmanship, use of defective Products or damage and whether incorporated in Work or not, which has been rejected by Consultant as failing to conform to Contract Documents. Replace or re-execute in accordance with Contract Documents.
- .3 Make good other Contractor's work damaged by such removals or replacements promptly.
- .4 If, in the Consultant's sole opinion, it is not expedient to correct defective Work or Work not performed in accordance with Contract Documents, Owner will deduct from Contract Price difference in value between Work performed and that called

for by Contract Documents, amount of which will be determined by the Owner acting reasonably.

1.8 REPORTS

- .1 Submit electronic copies of inspection and test reports to Consultant.
- .2 Provide copies to Subcontractor of work being inspected or tested and manufacturer or fabricator of material being inspected or tested.

1.9 TESTS AND MIX DESIGNS

- .1 Furnish test results and mix designs as requested.
- .2 Cost of tests and mix designs beyond those called for in Contract Documents or beyond those required by law of Place of Work will be appraised by Consultant and may be authorized as recoverable.

1.10 MOCK-UPS

- .1 Prepare mock-ups for Work specifically requested in Specifications. Include for Work of Sections required to provide mock-ups.
- .2 Construct in locations acceptable to Consultant or as specified in specific Section.
- .3 Prepare mock-ups for Consultant's review with reasonable promptness and in orderly sequence, to not cause delays in Work.
- .4 Failure to prepare mock-ups in ample time is not considered sufficient reason for extension of Contract Time and no claim for extension by reason of such default will be allowed.
- .5 If requested, Consultant will assist in preparing schedule fixing dates for preparation.
- .6 Applicable Specification Sections identify whether mock-up may remain as part of Work or if it must be removed and when.

1.11 MILL TESTS

- .1 Submit mill test certificates as requested or required by applicable Specification Sections.

1.12 EQUIPMENT AND SYSTEMS

- .1 Submit adjustment and balancing reports for mechanical, electrical and building equipment systems.
- .2 Submit integrated systems testing reports and verification letter to confirm integrated systems testing for fire protection and life safety systems has been successfully completed in accordance with CAN/ULC-S1001.

Part 2 Products

2.1 NOT USED

Part 3 Execution

3.1 NOT USED

END OF SECTION

Part 1 GENERAL

- .1 Read and conform to Division 01 requirements and documents referred to therein.

1.2 RELATED DOCUMENTS

- .1 Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section. Coordinate work in this Section with Section 01 14 00 – Work Restrictions and Site Restrictions Plan.

1.3 SUMMARY

- .1 This Section includes requirements for temporary utilities, support facilities, and security and protection facilities for Project construction operations.
- .2 Contractor must maintain the existing garage's operation during construction.
- .3 Owners will have Contractors working on site in the 'Contractors trailers'. Relocation of the trailers to be coordinated with the owner and must be complete between April 30th and October 1st Contractors trailers to be fully operational in winter periods within the contract, October 1st- April 30th.
- .4 Access to be maintained to all on site buildings throughout construction. See Appendix H - Site Restrictions and Proposed Phasing Plan.
- .5 Staff are to be moved back in to building from temporary trailers upon substantial completion. Refer to Appendix E.
- .6 Contractor to provide temporary office trailers, temporary power, data, heating, cooling, and washroom facilities for staff as per the requirements outlined in section 2.2 – Equipment.
- .7 Existing garage and washbay to be fully operational during winter operations (from October 1 to April 30).
- .8 All work within the garage shall be coordinated with the Owner to maintain business continuity. No work to be planned in the garage area between October 1 to April 30.
- .9 Refer to Section 20 05 15 Mechanical Work in Existing Buildings and 26 05 14 Working in Existing Facility for mechanical and electrical systems operational requirements in the existing garage during construction.
- .10 Related Sections:
 - .1 Section 01 10 00 - Summary for work restrictions and limitations on utility interruptions.
 - .2 Section 01 74 21 - Construction Waste Management and Disposal for provision of on-site construction waste and recycling facilities.
 - .3 Section 32 12 16 - Asphalt Paving for construction and maintenance of asphalt pavement for temporary roads and paved areas.

1.4 DEFINITIONS

- .1 Permanent Enclosure: As determined by Consultant, permanent or temporary roofing is complete, insulated, and weathertight; exterior walls are insulated and

weathertight; and all openings are closed with permanent construction or substantial temporary closures.

1.5 USE CHARGES

- .1 General: Use charges for temporary construction facilities and services are not chargeable to the Owner or Contractor and shall be included in the Contract Sum for this Project. Allow other entities to use temporary services and facilities without cost, including, but not limited to, the following:
 - .1 Owner's construction forces.
 - .2 Occupants of Project.
 - .3 Consultant.
 - .4 Testing agencies.
 - .5 Personnel of authorities having jurisdiction.

1.6 SUBMITTALS

- .1 Site Plan: Show temporary facilities, utility hookups, staging areas, and parking areas for construction personnel.
- .2 Temporary Utility Reports: Submit reports of tests, inspections, meter readings, and similar procedures performed on temporary utilities.
- .3 Fire-Safety Program: Show compliance with requirements of NFPA 241 and authorities having jurisdiction. Indicate Contractor personnel responsible for management of fire-prevention program.
- .4 Implementation and Termination Schedule: Within fifteen (15) days of date established for submittal of Contractor's Construction Schedule, submit a schedule indicating implementation and termination of each temporary utility.
- .5 Moisture-Protection Plan: Describe procedures and controls for protecting materials and construction from water absorption and damage.
 - .1 Describe delivery, handling, and storage provisions for materials subject to water absorption or water damage.
 - .2 Indicate procedures for discarding water-damaged materials, protocols for mitigating water intrusion into completed Work, and replacing water-damaged Work.
 - .3 Indicate sequencing of work that requires water and describe plans for dealing with water from these operations. Show procedures for verifying that wet construction has dried sufficiently to permit installation of finish materials.
- .6 Dust- and HVAC-Control Plan: Submit coordination drawing and narrative that indicates the dust- and HVAC-control measures proposed for use, proposed locations, and proposed time frame for their operation. Identify further options if proposed measures are later determined to be inadequate. Include the following:
 - .1 Locations of dust-control partitions at each phase of work.
 - .2 HVAC system isolation schematic drawing.
 - .3 Location of proposed air-filtration system discharge.
 - .4 Waste handling procedures.

- .5 Other dust-control measures.

1.7 QUALITY ASSURANCE

- .1 Standards: Comply with ANSI A10.6, NECA's "Temporary Electrical Facilities," and NFPA 241.
- .2 Electric Service: Comply with NECA, NEMA, and UL standards and regulations for temporary electric service. Install service to comply with NFPA 70.
- .3 Tests and Inspections: Arrange for authorities having jurisdiction to test and inspect each temporary utility before use. Obtain required certifications and permits.
- .4 Accessible Temporary Egress: For addition and renovation work that affects egress from occupied portions of the facility.

1.8 PROJECT CONDITIONS

- .1 Temporary Utilities: At earliest feasible time, when acceptable to Owner, change over from use of temporary service to use of permanent service.
 - .1 Temporary Use of Permanent Facilities: Installer of each permanent service shall assume responsibility for operation, maintenance, and protection of each permanent service during its use as a construction facility before Owner's acceptance, regardless of previously assigned responsibilities.
 - .2 Coordinate with each utility company for providing and terminating temporary utilities required during the construction contract time. The Owner makes no claims and shall not be held responsible for when permanent utilities will be available to the project site other than as described in these specifications and no later than the date of Substantial Completion. If conditions occur which require the Owner's involvement (obtaining easements or right-of-way), notify the Consultant and the Owner in a timely manner to allow for the procedures required to allow the permanent power to be brought to the site.
- .2 Conditions of Use: The following conditions apply to use of temporary services and facilities by all parties engaged in the Work:
 - .1 Keep temporary services and facilities clean and neat.
 - .2 Relocate temporary services and facilities as required by progress of the Work.

Part 2 PRODUCTS

2.1 MATERIALS

- .1 General: Provide new materials. Undamaged, previously used materials in serviceable condition may be used if approved by Consultant. Provide materials suitable for use intended.
- .2 Lumber and Plywood: Comply with requirements in Section 06 10 00.
- .3 Tarpaulins: Fire-resistive labeled with flame-spread rating of 15 or less.
- .4 Water: Potable.

2.2 EQUIPMENT:

.1: Field Offices:

All office furniture to be supplied and installed by the Region.

All other items, as described below, to be provided by the Contractor.

Temporary mobile office to include Min. Qty of (3) three spaces separated by a solid partition, with doors leading into the main office space.

- (1) one room (min dimension to be 11'-0" Wx12'-0" D)
to be outfitted with (3) three metal shelving units (to be supplied and installed by the Region and / or an installer specified by the Region).
This room to be used as storage for outdoor clothing and gear and to be used as a temporary changing area for staff.
- (1) one room (min dimension to be 11'-0" Wx12'-0" D)
To be outfitted with a 42" square or circular lunchroom table and (4) four chairs, (2) mobile tables for small appliances and a mini fridge (to be supplied and installed by the Region and / or an installer specified by the Region).
This room to be used as private meeting space for confidential conversations, as well as a break room / lunch area for staff.
- (1) one room (min dimension to be 37'-0" Wx12'-0" D)
To be used as office/ admin space.
Will be outfitted with Teknion TOS panel system making up (8) eight benching style workstations

- Min. Qty of (3) three spaces separated by solid partitions
Room 1: to be 48" W x 12" D
- Room 2: to be 11'-0" Wx12'-0" D
- Room 3: to be 48" W x 12" D

.1 Number of Desks:

- Temporary mobile office to be outfitted with Region owned systems furniture.
- To be installed by the Region and / or an installer specified by the Region and certified to install Teknion TOS systems furniture.
- Office / Admin room to be outfitted with (8) eight benching style workstations complete with (8) eight task chairs:
 - (4) four workstations to be 72" W x 42" D
 - (4) four workstations to be 54" W 42" D

- Min of 4'-5" of space required as pathway between workstations.
- Min of 3'-0" space required beside exit door before furniture can be installed

.2: Power and Data Requirements:

Power

- Approx. (16) Sixteen Duplex power outlets required.
- One Duplex power outlet required for each workstation.
- Each station requires 8T wiring system using a 1,2,3 circuit.
- All workstations to be powered using plug in base feed. Plug from electrical harness in panels directly inserted into duplex outlet.
- Workstations can also be hardwired into outlet if required

wiring system/receptacles

	Wiring System			
	8T	8K	7T	7K
Regular Ground Receptacles	1, 2, 3	1, 2	1, 2	1, 2, A, B
Isolated Ground Receptacles	5	5, 6	n/a	n/a

wiring system/related circuit

	Wiring System			
	8T	8K	7T	7K
Regular Circuit 1 Receptacle	✓	✓	✓	✓
Regular Circuit 2 Receptacle	✓	✓	✓	✓
Regular Circuit 3 Receptacle	✓		✓	
Isolated Circuit 5 IG Receptacle	✓	✓		
Isolated Circuit 6 IG Receptacle		✓		
Regular Circuit A Receptacle			✓	✓
Regular Circuit B Receptacle				✓

✓ Applicable

- one additional Duplex power outlet required for desktop Printer
- (6) six additional Duplex power outlet required as convenience outlets for vacuuming, charging
- Phones, tablets, and other equipment

Data

- Approx. (10) ten Data /ethernet ports required.
- One Data /ethernet port required for each workstation
- One Additional data port required for convenience
- Surge protectors to be provided by the contractor
- Contractor to provide a wall mounted 5RU shelf inside trailed to house temporary distribution equipment in the trailer

.3: Lighting Specifications:

Windows

- Temporary mobile office to be outfitted with Min of (5) five large windows to be placed as follows:
- Min (1) one window in storage and change room (Room 1)
- Min (3) three windows in Main office / admin area Room (2)
- Min (1) one window in Meeting/ break room (Room 3)

Lighting

- Recommend installing one recessed light for every 4-5 square feet in a room.
- Room 1: storage and change room requires approx. 1,000-2,000 lumens, approx. (2-4) LED recessed lights
- Room 2: Main office / admin requires approx. 3,600 and 7,200 lumens approx. (10-12) LED recessed lights
- Room 3: Meeting/ break room requires approx. 1,000-2,000 lumens, approx. (2-4) LED recessed lights

*Please note: Final placement of supervisor desks to be determined by the mobile trailer that is delivered to site – Door, window and electrical outlet placement will determine the final layout. It is noted that supervisors should be placed near windows as they need to be able to view gate at all times.

.4: Portable Washroom

- Washroom must have a minimum of (2) two Toilets c/w sink
- Washroom must include lighting, ventilation, HVAC – heating and cooling
- Must 1:1 ratio of sink to toilet stall

- Must have running water
- Regular service and cleaning to be included
- Must include off-site waste disposal
- Soap and water and/or anti-bacterial hand cleansers,
- Individual hand towels, air blowers or clean individual sections of continuous toweling,
- Trash cans for disposal of hand towels and feminine hygiene products.

*Please note that there are no on-site water or waste facilities available

.5: Temperature Control:

- The temporary mobile office and washroom must be equipped with climate control features, including heating for the winter months and cooling for the summer months, to ensure a comfortable working environment year-round in all parts/ rooms in the trailer
- Heating Equipment: Unless Owner authorizes use of permanent heating system, provide vented, self-contained, liquid-propane-gas or fuel-oil heaters with individual space thermostatic control.
- Use of gasoline-burning space heaters, open-flame heaters, or salamander-type heating units is prohibited.
- Heating Units: Listed and labeled, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use for type of fuel being consumed

.6. Storage Solutions:

- Temporary mobile office to be outfitted with Region owned systems furniture and storage units.
- To be installed by the Region and / or an installer specified by the Region and certified to install Teknion TOS systems furniture.

.7. Safety and Security:

- The temporary mobile office and washrooms shall be in accordance with the Ontario Building Code requirements
Ensure that the condition of the temporary mobile office unit and the temporary washroom unit is exemplary and free from any signs of wear or damage.
- Should the client express dissatisfaction with the condition of either unit upon delivery, it is the contractor's obligation to replace the unit to fulfill the client's requirements for satisfaction.
- Temporary mobile office to be outfitted with the following:
 - First aid kit

- Mobile eye-wash station
- Fire extinguishing : Hand carried, portable, UL rated. Provide class and extinguishing agent as indicated or a combination of extinguishers of NFPA-recommended classes for exposures.
 - Comply with NFPA 10 and NFPA 241 for classification, extinguishing agent, and size required by location and class of fire exposure.
- Health and safety Board: to be posted in a conspicuous place and kept posted while work is being completed
 - Board must include the constructor's name and if the constructor carries on business in a different name, the business name;
 - Must include the address and telephone number of the constructor's head office or principal place of business in Ontario; and
 - Must include the address and telephone number of the nearest office of the Ministry
 - Must include the address and telephone number of nearest hospital
- PPE Mandatory: A worker shall wear such protective clothing and use such personal protective equipment or devices as are necessary to protect the worker against the hazards to which the worker may be exposed

.8. Accessibility:

- Trailer must include stairs and a landing platform
- Stairs shall be securely fastened and supported wooden handrail on the open sides of each flight, and a guardrail on the open side of each landing.
- Stairs and landings shall be designed, constructed and maintained to support a live load of 4.8 kilonewtons per square meter without exceeding the allowable unit stresses for each material used.
- Ramps should be available if required at any time

.9: Drinking-Water Fixtures:

Provide drinking-water fountains or containerized, tap-dispenser, bottled-water drinking-water units, including paper cup supply.

Part 3 EXECUTION

3.1 INSTALLATION, GENERAL

- .1 Locate facilities where they will serve the Project adequately and result in minimum interference with performance of the Work. Relocate and modify facilities as required.
- .2 Provide each facility ready for use when needed to avoid delay. Maintain and modify as required. Do not remove until facilities are no longer needed or are replaced by authorized use of completed permanent facilities

3.2 TEMPORARY UTILITY INSTALLATION

- .1 General: Engage appropriate local utility company to install temporary service or connect to existing service. Where utility company provides only part of the service, provide the remainder with matching, compatible materials and equipment. Comply with utility company recommendations.
 - .1 Arrange with utility company, Owner, and existing users for time when service can be interrupted, if necessary, to make connections for temporary services.
 - .2 Provide adequate capacity at each stage of construction. Before temporary utility is available, provide trucked-in services.
 - .3 Obtain easements to bring temporary utilities to the Project site where Owner's easements cannot be used for that purpose.
- .2 Sewers and Drainage: If sewers are available, provide temporary connections to remove effluent that can be discharged lawfully. If sewers are not available or cannot be used, provide drainage ditches, dry wells, stabilization ponds, and similar facilities. If neither sewers nor drainage facilities can be lawfully used for discharge of effluent, provide containers to remove and dispose of effluent off-site in a lawful manner.
 - .1 Filter out excessive soil, construction debris, chemicals, oils, and similar contaminants that might clog sewers or pollute waterways before discharge.
 - .2 Connect temporary sewers to municipal system as directed by sewer department officials.
 - .3 Maintain temporary sewers and drainage facilities in a clean, sanitary condition. After heavy use, restore normal conditions promptly.
- .3 Water Service: Install water service and distribution piping in sizes and pressures adequate for construction until permanent water service is in use. Sterilize temporary water piping before use.
 - .1 Provide rubber hoses as necessary to serve the Project site.
 - .2 As soon as water is required at each level, extend service to form a temporary water- and fire-protection standpipe. Provide distribution piping. Space outlets so water can be reached with a 100-foot (30-m) hose. Provide one hose at each outlet.
 - .3 Where installations below an outlet might be damaged by spillage or leakage, provide a drip pan of suitable size to minimize water damage. Drain accumulated water promptly from pans.
 - .4 If water pressure is inadequate, provide pumps to supply a minimum static pressure suitable for construction needs. Provide pumps to supply a minimum of static pressure at highest point. Equip pumps with surge and storage tanks and automatic controls to supply water uniformly at reasonable pressures.
- .4 Sanitary Facilities: Provide temporary toilets, wash facilities, and drinking-water fixtures. Comply with regulations and health codes for type, number, location, operation, and maintenance of fixtures and facilities.
 - .1 Disposable Supplies: Provide toilet tissue, paper towels, paper cups, and similar disposable materials for the facility. Maintain adequate supply. Provide covered waste containers for disposal of used material.

- .2 Toilets: Install self-contained toilet units. Shield toilets to ensure privacy. Provide separate facilities for male and female personnel.
- .3 Drinking-Water: Provide bottled-water, drinking-water units or drinking water fountains connected to permanent or temporary potable water source.
- .5 Heating and Cooling: Provide temporary heating and cooling required by construction activities for curing or drying of completed installations or for protecting installed construction from adverse effects of low temperatures or high humidity. Select equipment from that specified that will not have a harmful effect on completed installations or elements being installed.
 - .1 Maintain a minimum temperature of 50 deg F in permanently enclosed portions of building for normal construction activities, and 65 deg F for finishing activities and areas where finished Work has been installed.
 - .2 Provide measures and equipment to meet warranty requirements of interior woodwork and casework.
- .6 Ventilation and Humidity Control: Provide temporary ventilation required by construction activities for curing or drying of completed installations or for protecting installed construction from adverse effects of high humidity. Select equipment from that specified that will not have a harmful effect on completed installations or elements being installed. Coordinate ventilation requirements to produce ambient condition required and minimize energy consumption.
 - .1 Provide measures and equipment to meet warranty requirements of interior woodwork and casework.
- .7 Electric Power Service: Provide weatherproof, grounded electric power service and distribution system of sufficient size, capacity, and power characteristics during construction period. Include meters, transformers, overload-protected disconnecting means, automatic ground-fault interrupters, and main distribution switchgear.
 - .1 Install electric power service underground, unless overhead service must be used.
 - .2 Install power distribution wiring overhead and rise vertically where least exposed to damage.
- .8 Electric Distribution: Provide data lines to temporary trailers as required, in advance of relocating staff. Provide receptacle outlets adequate for connection of power tools and equipment.
 - .1 Provide waterproof connectors to connect separate lengths of electrical power cords if single lengths will not reach areas where construction activities are in progress. Do not exceed safe length-voltage ratio.
- .9 Lighting: Provide temporary lighting with local switching that provides adequate illumination for construction operations and traffic conditions.
 - .1 Install and operate temporary lighting that fulfills security and protection requirements without operating entire system.
 - .2 Install exterior-yard site lighting that will provide adequate illumination for construction operations, traffic conditions, and signage visibility when the Work is being performed.

3.3 SUPPORT FACILITIES INSTALLATION

- .1 General: Comply with the following:
 - .1 Locate field offices, storage sheds, sanitary facilities, and other temporary construction and support facilities for easy access.
 - .2 Provide non-combustible construction for offices, shops, and sheds located within construction area or within 30 feet of building lines. Comply with NFPA 241.
 - .3 Maintain support facilities until near Substantial Completion. Remove before Substantial Completion. Personnel remaining after Substantial Completion will be permitted to use permanent facilities, under conditions acceptable to Owner.
- .2 Temporary Roads and Areas: Construct and maintain temporary roads and areas adequate to support loads and to withstand exposure to traffic during construction period. Locate temporary roads and areas as indicated on Drawings. Maintain temporary roads for duration of construction period. Do not construct or utilize permanent roads for construction without written permission of Owner.
- .3 Dewatering Facilities and Drains: Comply with requirements in applicable Division 31 for temporary drainage and dewatering facilities and operations not directly associated with construction activities included in individual Sections. Where feasible, use same facilities. Maintain the Project site, excavations, and construction free of water.
 - .1 Dispose of rainwater in a lawful manner that will not result in flooding the Project or adjoining property nor endanger permanent Work or temporary facilities.
 - .2 Before connection and operation of permanent drainage piping system, provide temporary drainage where roofing or similar waterproof deck construction is completed.
 - .3 Remove snow and ice as required to minimize accumulations.
- .4 Construction Waste Disposal and Recycling Facilities: Comply with the requirements specified in Section 01 74 19 - Construction Waste Management and Disposal. Open burning of construction waste is not permitted on the Project Site.
- .5 Common-Use Field Offices: Provide an insulated, weathertight, air-conditioned field office for use as a common facility by all personnel engaged in construction activities; of sufficient size to accommodate required office personnel and meetings of persons at the Project site. Keep offices clean and orderly.

3.4 SECURITY AND PROTECTION FACILITIES INSTALLATION

- .1 Environmental Protection: Provide protection, operate temporary facilities, and conduct construction in ways and by methods that comply with environmental regulations and that minimize possible air, waterway, and subsoil contamination or pollution or other undesirable effects. Avoid using tools and equipment that produce harmful noise. Restrict use of noisemaking tools and equipment to hours that will minimize complaints from persons or firms near the Project site.

- .2 Stormwater Control: Provide earthen embankments and similar barriers in and around excavations and subgrade construction, sufficient to prevent flooding by runoff of stormwater from heavy rains. Finish grading must produce surface drainage adequate to prevent standing water or wet areas, and to ensure that all storm water flows to inlets or other points of discharge.
- .3 Barricades, Warning Signs, and Lights: Comply with standards and code requirements for erecting structurally adequate barricades. Paint with appropriate colors, graphics, and warning signs to inform personnel and public of possible hazard. Where appropriate and needed, provide lighting, including flashing red or amber lights.
- .4 Temporary Enclosures: Provide temporary enclosures for protection of construction, in progress and completed, from exposure, foul weather, other construction operations, and similar activities. Provide temporary weathertight enclosure for building exterior.
- .5 Where heating or cooling is needed and permanent enclosure is not complete, provide insulated temporary enclosures. Coordinate enclosure with ventilating and material drying or curing requirements to avoid dangerous conditions and effects.
- .6 Vertical Openings: Close openings of 25 sq. ft. or less with plywood or similar materials.
- .7 Horizontal Openings: Close openings in floor or roof decks and horizontal surfaces with load-bearing, wood-framed construction.
- .8 Install tarpaulins securely using fire-retardant-treated wood framing and other materials.
- .9 Where temporary wood or plywood enclosure exceeds 100 sq. ft. in area, use fire-retardant-treated material for framing and main sheathing.
- .10 Temporary Fire Protection: Until fire-protection needs are supplied by permanent facilities, install and maintain temporary fire-protection facilities of types needed to protect against reasonably predictable and controllable fire losses. Comply with NFPA 241.
 - .1 Provide fire extinguishers, installed on walls on mounting brackets, visible and accessible from space being served, with sign mounted above.
 - .1 Other Locations: Class ABC dry-chemical extinguishers or a combination of extinguishers of NFPA-recommended classes for exposures.
 - .2 Locate fire extinguishers where convenient and effective for their intended purpose; provide not less than one extinguisher on each floor at or near each usable stairwell.
 - .2 Store combustible materials in containers in fire-safe locations.
 - .3 Maintain unobstructed access to fire extinguishers, fire hydrants, temporary fire-protection facilities, stairways, and other access routes for firefighting. Exterior access routes shall be in accordance with International Fire Code, Section 315.0. Prohibit smoking in hazardous fire-exposure areas.
 - .4 Supervise welding operations, combustion-type temporary heating units, and similar sources of fire ignition.

- .5 Permanent Fire Protection: At earliest feasible date in each area of the Project, complete installation of permanent fire-protection facility, including connected services, and place into operation and use. Instruct key personnel on use of facilities.
- .6 Develop and supervise an overall fire-prevention and first-aid fire-protection program for personnel at the Project site. Review needs with local fire department and establish procedures to be followed. Instruct personnel in methods and procedures. Post warnings and information.
- .7 Provide hoses for fire protection of sufficient length to reach construction areas. Hang hoses with a warning sign stating that hoses are for fire-protection purposes only and are not to be removed. Match hose size with outlet size and equip with suitable nozzles.

3.5 OPERATION, TERMINATION, AND REMOVAL

- .1 Supervision: Enforce strict discipline in use of temporary facilities. To minimize waste and abuse, limit availability of temporary facilities to essential and intended uses.
- .2 Maintenance: Maintain facilities in good operating condition until removal. Protect from damage caused by freezing temperatures and similar elements.
- .3 Maintain operation of temporary enclosures, heating, cooling, humidity control, ventilation, and similar facilities on a 24-hour basis where required to achieve indicated results and to avoid possibility of damage.
- .4 Prevent water-filled piping from freezing. Maintain markers for underground lines. Protect from damage during excavation operations.
- .5 Temporary Facility Changeover: Except for using permanent fire protections as soon as available, do not change over from using temporary security and protection facilities to permanent facilities until Substantial Completion.
- .6 Termination and Removal: Remove each temporary facility when need for its service has ended, when it has been replaced by authorized use of a permanent facility, or no later than Substantial Completion. Complete or, if necessary, restore permanent construction that may have been delayed because of interference with temporary facility. Repair damaged Work, clean exposed surfaces, and replace construction that cannot be satisfactorily repaired.
 - .1 Materials and facilities that constitute temporary facilities are the property of Contractor. Owner reserves right to take possession of Project identification signs.
 - .2 Remove temporary paving not intended for or acceptable for integration into permanent paving. Where area is intended for landscape development, remove soil and aggregate fill that do not comply with requirements for fill or subsoil. Remove materials contaminated with road oil, asphalt and other petrochemical compounds, and other substances that might impair growth of plant materials or lawns. Repair or replace street paving, curbs, and sidewalks at temporary entrances, as required by authorities having jurisdiction.
- .7 At Project Substantial Performance, clean and renovate permanent facilities used during construction period. Comply with final cleaning requirements in Section 01 77 00 - Closeout Procedures.

END OF SECTION

Part 1 General

1.1 GENERAL REQUIREMENTS

- .1 Read and conform to Division 01 requirements and documents referred to therein.

1.2 REFERENCES

- .1 Reference Standards:
 - .1 Canada Green Building Council (CaGBC):
 - .1 LEED Canada V4 – Building Design and Construction (BD+C), Interior Design + Construction (ID+C).

1.3 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Provide submittals in accordance with Section 01 33 00 - Submittal Procedures.
- .2 LEED Submittals: provide LEED submittals in accordance with Section 01 33 01 – LEED V4 Submittal List.

1.4 INSTALLATION AND REMOVAL

- .1 Provide temporary utilities controls in order to execute Work expeditiously.
- .2 Remove from site all such Work after use.

1.5 DEWATERING

- .1 Provide temporary drainage and pumping facilities to keep excavations and site free from standing water.
- .2 Refer to Section 00 30 00 – Information Documents “Construction Dewatering Assessment dated November 21, 2024, prepared by Hydrogeology Consulting Services” for dewatering rates and construction dewatering monitoring program. Provide test results as required by the Consultant.

1.6 WATER SUPPLY

- .1 Provide continuous supply of potable water for construction use.
- .2 Arrange for connection with appropriate utility company and pay costs for installation, maintenance and removal.
- .3 Pay for utility charges at prevailing rates.

1.7 TEMPORARY HEATING AND VENTILATION

- .1 Refer to Section 01 81 19 - Indoor Air Quality and follow requirements for implementation of Indoor Air Quality Management Plan.
- .2 Provide temporary heating required during construction period, including attendance, maintenance and fuel.
- .3 Construction heaters used inside building must be vented to outside or be flameless type. Solid fuel salamanders are not permitted.
- .4 Provide temporary heat and ventilation in enclosed areas as required to:
 - .1 Facilitate progress of Work.

- .2 Protect Work and Products against dampness and cold.
- .3 Prevent moisture condensation on surfaces.
- .4 Provide ambient temperatures and humidity levels for storage, installation and curing of materials.
- .5 Provide adequate ventilation to meet health regulations for safe working environment.
- .5 Maintain temperatures of minimum 10 degrees Celsius in areas where construction is in progress.
- .6 Ventilating:
 - .1 Meet requirements of Section 01 81 19 - Indoor Air Quality.
 - .2 Prevent accumulations of dust, fumes, mists, vapours or gases in areas occupied during construction.
 - .3 Provide local exhaust ventilation to prevent harmful accumulation of hazardous substances into atmosphere of occupied areas.
 - .4 Dispose of exhaust materials in manner that will not result in harmful exposure to persons.
 - .5 Ventilate storage spaces containing hazardous or volatile materials.
 - .6 Ventilate temporary sanitary facilities.
 - .7 Continue operation of ventilation and exhaust system for time after cessation of Work process to ensure removal of harmful contaminants.
- .7 Permanent heating system of building, to be used when available. Be responsible for damage to heating system if use is permitted.
- .8 On completion of Work for which permanent heating system is used, replace filters, replace bearing, and thoroughly clean permanent equipment used during construction.
- .9 Ensure Date of Substantial Performance and Warranties for heating system do not commence until entire system is in as near original condition as possible and is certified by Consultant.
- .10 Pay costs for maintaining temporary heat, when using permanent heating system.
- .11 Maintain strict supervision of operation of temporary heating and ventilating equipment to:
 - .1 Meet requirements of Section 01 81 19 - Indoor Air Quality.
 - .2 Conform with applicable codes and standards.
 - .3 Enforce safe practices.
 - .4 Prevent abuse of services.
 - .5 Prevent damage to finishes.
 - .6 Vent direct-fired combustion units to outside.
- .12 Be responsible for damage to Work due to failure in providing adequate heat and protection during construction.

1.8 TEMPORARY POWER AND LIGHT

- .1 Provide and pay for temporary power during construction for temporary lighting and operating of power tools.
- .2 Arrange for connection with appropriate utility company. Pay costs for installation, maintenance and removal.
- .3 Provide and maintain temporary lighting throughout Project. Ensure level of illumination on all floors and stairs is not less than 162 lx.
- .4 Electrical power and lighting systems installed under this Contract may be used for construction requirements only with prior approval of Consultant provided that guarantees are not affected. Make good damage to electrical system caused by use under this Contract. Replace lamps which have been used for more than 3 months.

1.9 TEMPORARY COMMUNICATION FACILITIES

- .1 Provide and pay for temporary telephone and data (Wi-Fi) hook up, lines and equipment necessary for own use.

1.10 FIRE PROTECTION

- .1 Provide and maintain temporary fire protection equipment during performance of Work required by insurance companies having jurisdiction and governing codes, regulations and bylaws.
- .2 Burning rubbish and construction waste materials is not permitted on Site.

Part 2 Products

2.1 NOT USED

Part 3 Execution

3.1 NOT USED

END OF SECTION

Part 1 General

1.1 GENERAL REQUIREMENTS

- .1 Read and conform to Division 01 requirements and documents referred to therein.

1.2 REFERENCES

- .1 Canadian Construction Documents Committee (CCDC)
 - .1 CCDC 2-2020, Stipulated Price Contract as amended in the Contract Documents.
- .2 Canadian Standards Association (CSA International)
 - .1 CSA-A23.1-14/A23.2-14, Concrete Materials and Methods of Concrete Construction/Methods of Test for Concrete, Includes Updates through No. 3 August 2006.
 - .2 CSA-O121-17), Douglas Fir Plywood.
 - .3 CAN/CSA-S269.2-16, Access Scaffolding for Construction Purposes.
 - .4 CAN/CSA-Z321-96 (R2006) - Signs and Symbols for the Workplace
- .3 U.S. Environmental Protection Agency (EPA) / Office of Water
 - .1 2017 U.S. EPA Construction General Permit.

1.3 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Provide submittals in accordance with Section 01 33 00 - Submittal Procedures.

1.4 INSTALLATION AND REMOVAL

- .1 Prepare site staging plan indicating proposed location and dimensions of area to be fenced and used by Contractor, number of trailers to be used, avenues of ingress/egress to fenced area and details of fence installation, trailer location, material storage, material delivery and pick up, garbage disposal as well as in-house and Contractor parking.
- .2 Identify areas which have to be gravelled to prevent tracking of mud.
- .3 Indicate use of supplemental or other staging area.
- .4 Provide construction facilities in order to execute work expeditiously.
- .5 Remove from Site all such work after use.

1.5 SCAFFOLDING

- .1 Scaffolding in accordance with CAN/CSA-S269.2.
- .2 Provide and maintain scaffolding, ramps, ladders, swing staging, platforms and temporary stairs.

1.6 HOISTING

- .1 Provide, operate and maintain hoists cranes required for moving of workers, materials and equipment. Make financial arrangements with Subcontractors for their use of hoists.

- .2 Hoists cranes to be operated by qualified operator.

1.7 SITE STORAGE/LOADING

- .1 Confine work and operations of employees by Contract Documents. Do not unreasonably encumber premises with products.
- .2 Do not load or permit to load any part of Work with weight or force that will endanger Work.

1.8 CONSTRUCTION PARKING

- .1 Parking will not be permitted on Site.
- .2 Provide and maintain adequate access to project Site.

1.9 SECURITY

- .1 Provide fencing and additional security as deemed necessary by Contractor.

1.10 OFFICES

- .1 Provide office heated to 22 degrees C, lighted 750 lx and ventilated, of sufficient size to accommodate site meetings and furnished with drawing laydown table.
- .2 Provide marked and fully stocked first-aid case in a readily available location.
- .3 Subcontractors to provide their own offices as necessary. Direct location of these offices as directed by Owner.

1.11 EQUIPMENT, TOOL AND MATERIALS STORAGE

- .1 Provide and maintain, in clean and orderly condition, lockable weatherproof sheds for storage of tools, equipment and materials.
- .2 Locate materials not required to be stored in weatherproof sheds on Site in manner to cause least interference with work activities.

1.12 SANITARY FACILITIES

- .1 Provide sanitary facilities for work force in accordance with governing regulations and ordinances.
- .2 Provide separate facilities for staff through as indicated in Section 01 50 00 – Temporary Facilities and Controls.
- .3 Post notices and take precautions as required by local health authorities. Keep area and premises in sanitary condition.

1.13 CONSTRUCTION SIGNAGE

- .1 Provide and erect project sign, prior to the start of construction, in a location designated by the Consultant and approved by the Owner. Signage design shall be provided by the Consultant.
- .2 No other signs or advertisements, other than warning signs, are permitted on Site.

- .3 Locate project identification sign as directed by Consultant and construct as follows:
 - .1 Build concrete foundation, erect framework, and attach signboard to framing.
 - .2 Paint surfaces of signboard and framing with one coat primer and two coats enamel. Colour white on signboard face, black on other surfaces.
 - .3 Apply vinyl sign face overlay to painted signboard face in accordance with installation instruction supplied.
- .4 Maintain approved signs and notices in good condition for duration of the Contract, and dispose of off site upon Total Performance of the Contract or earlier if directed by the Consultant.

1.14 PROTECTION AND MAINTENANCE OF TRAFFIC

- .1 Provide access as necessary to maintain traffic. Refer to Supplementary Conditions and no standing vehicles can block York Regional Police egress and access to Baseline Road.
- .2 Maintain and protect traffic on affected roads during construction period except as otherwise specifically directed by Consultant.
- .3 Provide measures for protection and diversion of traffic, including provision of watch-persons and flag-persons, erection of barricades, placing of lights around and in front of equipment and work, and erection and maintenance of adequate warning, danger, and direction signs
- .4 Protect travelling public, York Region Staff and Regional contractors from damage to person and property.
- .5 Contractor's traffic on roads selected for hauling material to and from Site to interfere as little as possible with public traffic.
- .6 Verify adequacy of existing roads and allowable load limit on these roads. Contractor is responsible for repair of damage to roads caused by construction operations.
- .7 Provide necessary lighting, signs, barricades, and distinctive markings for safe movement of traffic.
- .8 Dust control: adequate to ensure safe operation at all times.
- .9 Location, grade, width, and alignment of construction and hauling roads: subject to approval by Consultant.
- .10 Lighting: to assure full and clear visibility for full width of haul road and work areas during night work operations.
- .11 Provide snow removal during period of Work.
- .12 Remove, upon completion of work, haul roads designated by Consultant.

1.15 CLEAN-UP

- .1 Remove construction debris, waste materials, packaging material from work site daily.
- .2 Clean dirt or mud tracked onto paved or surfaced roadways at intervals appropriate to keep roads and driveway free from dust and debris.

- .3 Store materials resulting from demolition activities that are salvageable.
- .4 Stack stored new or salvaged material not in construction facilities.

Part 2 Products

2.1 NOT USED

Part 3 Execution

3.1 TEMPORARY EROSION AND SEDIMENTATION CONTROL

- .1 Provide temporary erosion and sedimentation control measures to prevent soil erosion and discharge of soil-bearing water runoff or airborne dust to adjacent properties and walkways, according to requirements of Authorities Having Jurisdiction.
- .2 Inspect, repair, and maintain erosion and sedimentation control measures during construction until permanent vegetation has been established.
- .3 Remove erosion and sedimentation controls and restore and stabilize areas disturbed during removal.

END OF SECTION

Part 1 General

1.1 GENERAL REQUIREMENTS

- .1 Read and conform to Division 01 requirements and documents referred to therein.

1.2 REFERENCES

- .1 Canadian Standards Association (CSA International)
 - .1 CSA-O121-17 Douglas Fir Plywood.

1.3 INSTALLATION AND REMOVAL

- .1 Provide temporary controls in order to execute Work expeditiously.
- .2 Remove from Site all such work after use.

1.4 HOARDING

- .1 Erect temporary Site enclosure using purpose made, prefabricated interlocking metal fence panels 2.1 m high.
- .2 Provide one lockable truck entrance gate and at least one pedestrian door as directed and conforming to applicable traffic restrictions on adjacent streets. Equip gates with locks and keys.
- .3 Erect and maintain pedestrian walkways including roof and side covers, complete with signs and electrical lighting as required by Authorities Having Jurisdiction.
- .4 Provide barriers around trees and plants designated to remain. Protect from damage by equipment and construction procedures.

1.5 GUARD RAILS AND BARRICADES

- .1 Provide secure, rigid guard rails and barricades around deep excavations, open shafts, open stair wells, open edges of floors and roofs.
- .2 Provide as required by governing authorities.

1.6 WEATHER ENCLOSURES

- .1 Provide weather tight closures to unfinished door and window openings, tops of shafts and other openings in floors and roofs.
- .2 Close off floor areas where walls are not finished; seal off other openings; enclose building interior work for temporary heat.
- .3 Design enclosures to withstand wind pressure and snow loading.

1.7 DUST TIGHT SCREENS

- .1 Provide dust tight screens or insulated partitions to localize dust generating activities, and for protection of workers, finished areas of Work and public.
- .2 Maintain and relocate protection until such work is complete.

Contract Number: RFTC-1868-24-TR88179

1.8 ACCESS TO SITE

- .1 Provide and maintain access roads, sidewalk crossings, ramps and construction runways as may be required for access to Work.

1.9 PUBLIC TRAFFIC FLOW

- .1 Provide and maintain competent signal flag operators, traffic signals, barricades and flares, lights, or lanterns as required to perform Work and protect public.

1.10 FIRE ROUTES

- .1 Maintain access to property including overhead clearances for use by emergency response vehicles.

1.11 PROTECTION FOR OFF-SITE AND PUBLIC PROPERTY

- .1 Protect surrounding private and public property from damage during performance of Work.
- .2 Be responsible for damage incurred.

1.12 PROTECTION OF BUILDING FINISHES

- .1 Provide protection for finished and partially finished building finishes and equipment during performance of Work.
- .2 Provide necessary screens, covers, and hoardings.
- .3 Confirm with Consultant locations and installation schedule 3 days prior to installation.
- .4 Be responsible for damage incurred due to lack of or improper protection.

1.13 WASTE MANAGEMENT AND DISPOSAL

- .1 Separate waste materials for reuse and recycling in accordance with Section 01 74 19 – Construction Waste Management.

Part 2 Products

2.1 NOT USED

Part 3 Execution

3.1 NOT USED

END OF SECTION

PART 1– GENERAL

1.1 GENERAL REQUIREMENTS.

- .1 Comply with Division 1 requirements and documents referred to herein.

1.2 RELATED SECTIONS

- .1 Section 01 81 13 General LEED® Requirements.

1.3 REFERENCES

- .1 LEED® v4 Reference Guide for Green Building Design and Construction (LEED® USGBC BD&C 2013), United States Building Council
- .2 LEED® Online v4 BD+C USGBC Forms
- .3 U.S. Environmental Protection Agency (EPA) Construction General Permit, 2012

1.4 DEFINITIONS

- .1 Temporary erosion controls shall include, but shall not be limited to: sodding, mulching, watering, coir blankets, seeding, reseeding, berms, interceptor ditches, and/or other best management practices (BMPs) which will ensure that erosion during construction will be either eliminated or minimized.
- .2 Temporary sedimentation controls shall include, but shall not be limited to: silt fences, Silt Soxx, sediment traps, barriers, and/or other BMPs to control soil erosion.

1.5 DESCRIPTION OF WORK

- .1 Prevent the loss of soil from the construction site resulting from storm water runoff, wind erosion, and construction activities. This includes protecting topsoil by stockpiling for reuse.
- .2 Prevent sedimentation of receiving storm sewer and roadway
- .3 Prevent air pollution caused by dust and particulate matter.
- .4 Meet and/or exceed the requirements of LEED® v4 BD&C Sustainable Sites Prerequisite: Construction Activity and Pollution Prevention, which specifies compliance with EPA Construction General Permit 2012, OR local erosion and sedimentation control standards and codes, whichever is more stringent.

1.6 QUALITY ASSURANCE

- .1 Provide erosion control methods in accordance with LEED® v4 BD&C Sustainable Sites Prerequisite 1: Construction Activity and Pollution Prevention and/or requirements of authorities having jurisdiction. The Contractor shall comply with all applicable rules and regulations in terms of both installation and maintenance during construction.
- .2 The site superintendent (or other individual designated by the Contractor) shall be responsible for all aspects of LEED® coordination related to erosion and sedimentation control. This individual will be responsible for:

- .1 Implementing erosion and sedimentation control measures shown on the drawings and described in the Erosion and Sedimentation Control Plan and this section in accordance with manufacturer instructions and the prescribed installation procedures in the referenced EPA document and herein. Control measures shall be updated and managed in accordance with the work on site. No additional charges will be permitted for additional measures required to manage the sequencing and methods of the work.
- .2 Conducting erosion and sedimentation control measure inspections and making necessary repairs
- .3 Maintaining an erosion and sedimentation control inspection log to document observations, deficiencies and corrective actions. This includes taking photographs.
- .4 Preparing erosion and sedimentation control documentation and submittals required for LEED® certification as detailed herein.
- .5 Reporting erosion and sedimentation control progress to the Consultant.
- .6 Participating in the LEED® Kick-Off meeting as described in Section 01 81 13 General LEED® Requirements.

1.7 SUBMITTALS

- .1 Erosion and Sedimentation Control Plan aligning with LEED v4 BD&C Sustainable Sites Prerequisite 1: Construction Activity and Pollution Prevention. Refer to LEED Consultant to confirm Plan's compliance.
- .2 Submit the following in accordance with conditions of contract and general conditions sections:
 - .1 Product data for silt barriers and netting.
 - .2 The Contractor has the option to submit additional control measures in the form of shop drawings.
- .3 ESC Inspection Log (to be completed by the Contractor)
 - .1 Inspections of the installed erosion and sediment control measures shall be carried out on a weekly basis or following any storm event greater than 10mm of precipitation. These inspections will be recorded and compiled in a summary log.
 - .2 Submit completed ESC Inspection Logs to the Consultant on a monthly basis as part of the ongoing Monthly LEED® Reports required in Section 01 81 13 – General LEED Requirements.
 - .3 Inspection log shall contain the following as a minimum:
 - .1 General Project Information
 - .2 Individual responsible for inspections
 - .3 Date of each inspection
 - .4 Weather conditions
 - .5 Deficiencies observed
 - .6 Corrective actions taken to restore deficiencies, date these repairs were completed and photographs of damaged and repaired areas/control measures
 - .7 Signature of party responsible for inspection and corrective actions/repairs

-
- .4 Digital Date-Stamped Photographs of installed sediment and erosion control measures
 - .1 Each erosion and sediment control measure shall be photographed by the Contractor:
 - .1 Immediately after installation
 - .2 Each week and following a significant storm event
 - .3 If damage is discovered and following repair of said damage
 - .2 These photographs will be submitted to the Consultant monthly with an annotation describing each photograph as part of the ongoing Monthly LEED® Reports required in Section 01 81 13. – General LEED Requirements.

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION

3.1 GENERAL

- .1 Erosion control devices as shown on the plans are the minimum required based upon the finished grades for the site. The Contractor is responsible to provide additional devices for erosion protection at the Contractor's expense to minimize erosion during all phases of activity.
- .2 The Contractor shall maintain temporary construction entrances and remove all mud and debris from public roads on a daily basis, or more often if needed.
- .3 Erosion and sedimentation control measures shall be maintained and inspected until the next phase of building construction commences.

PART 4 SUPPLEMENTS

- 1. The document listed below, attached following "END OF SECTION", forms part of this Specification Section:
 - 1. ESC Report Review Checklist

END OF SECTION

ESC: REPORT REVIEW CHECKLIST

Project Name:		Completed By:	
Project Location:		Weather Conditions:	

Observations	
Deficiencies Noted	
Correction Actions Taken	
Date of Completion	

ESC Measure	Date:		
	Yes	No	Comments
Are photos taken?	<input type="checkbox"/>	<input type="checkbox"/>	
Are entrances installed according to the approved plans, and best practices? (Check for material/ debris on street, run off diversion)	<input type="checkbox"/>	<input type="checkbox"/>	
Are basins installed according to the approved plans, and best practices? (Check for runoff directed to basin, down slope areas stabilized riser pipe wrapped with wire fence/filter, fabric, emergency overflow, accumulated sediment more than 40% of volume, etc.)	<input type="checkbox"/>	<input type="checkbox"/>	
Are silt fences installed according to the approved plans, and best practices? (Check for fabrics trenched in, follow contour, turned up slope at ends, silt accumulated, broken stakes, areas where sediment could leave the site.)	<input type="checkbox"/>	<input type="checkbox"/>	
Are all inlet protection measures installed according to plans? (Check for runoff ponding, in good shape, silt accumulated, etc.)	<input type="checkbox"/>	<input type="checkbox"/>	
Are all disturbed areas that will lay dormant for 21 days or more stabilized with seed, sod, or mulch? (Stockpile, hillsides, etc.)	<input type="checkbox"/>	<input type="checkbox"/>	
Are all stabilized areas in good condition and not eroding?	<input type="checkbox"/>	<input type="checkbox"/>	
Have all areas that have achieved final grade within the past 7 days been stabilized?	<input type="checkbox"/>	<input type="checkbox"/>	
Is there evidence of material leaving the site in the form of dust? (Required action: apply water and calcium chloride to gravel roads.)	<input type="checkbox"/>	<input type="checkbox"/>	
Have the appropriate retaining walls indicated on grading plans been constructed to stabilize soil on steep slopes?	<input type="checkbox"/>	<input type="checkbox"/>

PART 1 – GENERAL

1.1 GENERAL INSTRUCTIONS

- .1 Comply with Division 1 requirements and documents referred to herein.

1.2 SUMMARY

- .1 Provide LEED® product requirements including but not limited to following:
 - .1 Minimize ecological footprint of the building by specifically selecting materials that conserve raw and non-renewable resources.
 - .2 Minimize amount of energy expended in transportation of materials to Site through intentional sourcing of regional materials.
 - .3 To document for the purpose of LEED® Certification under the United States Building Council LEED®- v4.1 Building Design and Construction.
 - .4 Source and select materials that meet sustainability criteria detailed herein.
 - .5 Provide documentation to Consultant as detailed within this Section to certify materials meet criteria prior to ordering of Products or materials.

1.3 RELATED SECTIONS

- .1 Section 01 81 13 General LEED® Requirements

- .3 Division 04, Masonry
- .4 Division 05, Metals
- .5 Division 06, Wood, Plastics, and Composites
- .6 Division 07, Thermal and Moisture Protection
- .7 Division 08, Openings
- .8 Division 09, Finishes
- .9 Division 10, Specialties
- .10 Division 31, Earthwork
- .11 Division 32, Exterior Improvements

1.4 REFERENCES

- .1 LEED® v4.1 Reference Guide for Green Building Design and Construction, Canada Green Building Council (CaGBC).

1.5 DEFINITIONS

- .1 Recycled Content: is percentage by weight of recycled material that is in a product or material brought onto site.
- .2 Post-Consumer Recycled Content: amount by weight of recycled material derived from previously used consumer products (e.g., aluminum and steel cans, glass and plastic bottles, asphalt from parking lots, gypsum from drywall etc.).

- .3 Pre-Consumer Recycled Content: amount by weight of recycled material derived from outside industrial sources (i.e., in-house process recycling of production scrap is not included). Some examples of this are: sawmill dust used in MDF board, blast furnace slag used in mineral wool insulation, and coal fly ash used in concrete mixes.
- .4 In-House Process Recycled Content: trimmings, cut-offs and scrap returned to the production process as a part of internal housekeeping.
- .5 Manufacturing Location: is last point of processing or assembly (e.g., A sawmill that turns harvested trees into framing lumber which is then used on-site).
- .6 Extraction Location: is origin of material inputs that are transported to Manufacturing Location (e.g. location of forests where trees for framing lumber were harvested from).
- .7 Rapidly Renewable Materials: Agriculture products, both fiber and animal, that take 10 years or less to grow or raise and can be harvested in a sustainable fashion.
- .8 Environmental Product Declaration (EPD): a statement that the product meets the environmental requirements of ISO 14021-1999 and ISO 14044-2006.
- .9 Life Cycle Assessment (LCA): an evaluation of a product that studies the environmental impacts from cradle to grave, as defined by ISO 14040-2006 and ISO 14044-2006.
- .10 Health Product Declaration (HPD): a statement that provides full disclosure of the potential chemicals of concern in products.
- .11 Corporate Social Responsibility (CSR): voluntary activities undertaken by a company to operate in an economically, socially, and environmentally sustainable manner.
- .12 Low-Carbon Concrete: concrete which, when compared with conventional concrete materials, performs well in a series of six climate parameters that LEED requires to be measured in LCA work.

1.6 DESCRIPTION OF WORK

- .1 Site superintendent (or other individual designated by Contractor) is responsible for coordinating activities associated with LEED® Product requirements.
- .2 LEED® Product requirement responsibilities include:
 - .1 Providing the total construction cost for materials within Divisions 03 – 10, 31 and 32 to the LEED Consultant for material credit calculations.
 - .2 Provide an estimate of total concrete material amounts (by mix) on the project to the LEED Consultant for LCA calculations.
 - .3 Providing a final itemized list of materials within Divisions 03 – 10, 31 and 32 to the LEED Consultant such as the shop drawing log.
 - .4 Coordinating with subcontractors to select products and materials that meet requirements specified herein.
 - .5 Providing product and material documentation submittals as detailed herein prior to the ordering of product or material.
 - .6 Providing final material costs (sub-contractor cost excluding labour and equipment) to the Consultant for material credit calculations
 - .7 Reporting products and materials selection progress to Consultant.
 - .8 Participating in the LEED® Kick-Off meeting as described in Section 01 81 13 General LEED® Requirements.

1.7 SUBMITTALS

- .1 Building Product Disclosure and Optimization Calculator (appended to this Section)
 - .1 Complete schedule and collect supporting documentation (Product literature, manufacturer information, EPDs, HPDs, etc.) for products and materials listed in Part 2 of this Section.
 - .2 Complete schedule by providing individual material costs (excluding labour and equipment) for all building products and materials in Divisions 03 – 10, 31 and 32 that contribute to meeting LEED® requirements specified in this Section.
 - .3 Only materials that are permanently installed in the project are applicable. Temporary construction applications such as bracing, concrete form work and pedestrian barriers shall not be included.

PART 2 - PRODUCTS

2.1 ENVIRONMENTAL PRODUCT DECLARATIONS

- .1 Select products/materials with Environmental Product Declarations and fall within Divisions 03 – 10, 31 and 32.
- .2 Products and materials chosen must have either a Product-Specific Declaration (conforming to ISO 14044), an Industry-Wide Type III EPD, or a Product-Specific Type III EPD (conforming to ISO 14025, and EN 15804 or ISO 21930).
- .3 Ensure the products and materials listed below have available EPDs that are compliant with ISO standards and have a corresponding Product Category Rule (PCR):
 - .1 Asphalt
 - .2 Concrete
 - .3 Concrete Reinforcement
 - .4 Precast Concrete
 - .5 Masonry
 - .6 Structural Steel
 - .7 Steel Deck, Roofing and Siding
 - .8 Steel Deck, Roofing and Siding
 - .9 Sheet Metal Flashing
 - .10 Light Steel Framing (Steel Studs)
 - .11 Composite Wood (MDF, Particle Board, Plywood)
 - .12 Fiberglass Insulation
 - .13 Mineral Wool Insulation
 - .14 Metal Wall Panels
 - .15 Metal Doors
 - .16 Gypsum
 - .17 Ceramic Tile
 - .18 Acoustic Tiles

- .19 Suspended Ceiling T-Grid
- .20 Resilient Flooring
- .21 Carpet
- .22 Wood doors
- .23 Finish Carpentry
- .24 Wood Flooring
- .25 Acoustical Wood Ceilings

2.2 MATERIAL INGREDIENT REPORTING AND OPTIMIZATION

- .1 Select products/materials from manufacturers that have published the chemical inventory of their products/materials to at least 0.1% (1000ppm). Applicable publication programs include:
 - .1 Manufacturer report providing an inventory of all ingredients identified by the name and Chemical Abstract Service Registration Number (CASRN);
 - .2 Products with a published, complete Health Product Declaration;
 - .3 Products has a Material Health Certificate or is Cradle to Cradle certified under v3 or later at the Bronze level or higher.
 - .4 Products with a Declare product label; Declare labels designated as Red List Free or LBC Compliant that demonstrate content inventory to 1000 ppm.
- .2 Select products/materials from manufacturers that document their material optimization using one of the following options:
 - .1 Manufacturer Ingredient Screening report that has screened the product to at least 1000 ppm and has a publicly available inventory and a detailed action plan to reduce known hazards using the principles of green chemistry.
 - .2 Material Inventory of Health Product Declaration of the product, demonstrating a chemical inventory of at least 100 ppm. The HPD or Manufacturer Inventory must be third party verified.
 - .3 REACH Optimization.
- .3 Materials fall within Divisions 03 – 10, 31 and 32.
- .4 At a minimum, the following materials shall be included:
 - .1 Asphalt
 - .2 Concrete
 - .3 Concrete Reinforcement
 - .4 Precast Concrete
 - .5 Masonry
 - .6 Structural Steel
 - .7 Steel Deck, Roofing and Siding
 - .8 Steel Deck, Roofing and Siding
 - .9 Sheet Metal Flashing
 - .10 Light Steel Framing (Steel Studs)

- .11 Composite Wood (MDF, Particle Board, Plywood)
- .12 Fiberglass Insulation
- .13 Mineral Wool Insulation
- .14 Metal Wall Panels
- .15 Metal Doors
- .16 Gypsum
- .17 Ceramic Tile
- .18 Acoustic Tiles
- .19 Suspended Ceiling T-Grid
- .20 Resilient Flooring
- .21 Carpet
- .22 Wood doors
- .23 Finish Carpentry
- .24 Wood Flooring
- .25 Acoustical Wood Ceilings

2.3 REGIONAL CONTENT

- .1 Select products/materials that are extracted, manufactured, and purchased within 160 km of the project site and that fall within Divisions 03 – 10, 31 and 32.

END OF SECTION

Part 1 General

1.1 GENERAL REQUIREMENTS

- .1 Read and conform to Division 01 requirements and documents referred to therein.

1.2 SUMMARY

- .1 Section Includes:
 - .1 This Section indicates the criteria for use of optional Products listed in the Specification and provision for proposing changes to acceptable materials listed during the Bid Period and during the course of construction.
 - .2 LEED Requirements: Materials and Products have been selected to comply with requirements of the Leadership in Energy and Environmental Design (LEED) program. Substituted materials and Products must meet or exceed LEED requirements for targeted credits.
 - .3 Substitution requests must be accompanied by a LEED Materials Submittal Form and a LEED Emissions Submittal Form for each substituted Product. LEED Materials Submittal Form and LEED Emissions Submittal Form are to be downloaded from www.usgbc.org/resources.
- .2 Related Requirements:
 - .1 Specification Sections referencing this Section.

1.3 REFERENCES

- .1 Definitions:
 - .1 Acceptable Materials: The term Acceptable Materials is used to specify Products by trade name, manufacturer, catalogue number, model number, or similar reference, and is used within the Project Manual as follows:
 - .1 Acceptable Materials listings are based on Consultant's determination that materials meet specified requirements and opinion of applicability to the Project requirements.
 - .2 Acceptable Materials listings are deemed to establish the standard of acceptance that Consultant will consider appropriate for the Work.
 - .3 Any Product listed in the Acceptable Materials listing may be used to establish the Bid Price.
 - .2 Basis-of-Design Materials: The term Basis-of-Design Materials is used to specify a specific material name, manufacturer, catalogue number, model number or similar reference and is used as follows:
 - .1 Basis-of-Design Materials are used to establish Consultant's preference for a single source Product listing based on performance, appearance or configuration.
 - .2 Use the Basis-of-Design Material to establish the Bid Price, unless an Addendum is issued adding additional Acceptable Materials.

- .3 Basis-of-Design Materials designation does not limit the Contractor's ability to submit Proposed Substitutions in accordance with Substitutions requirements of this Section and specific performance requirements listed in Technical Specification Sections.
- .3 Non-proprietary Specification means a Specification which includes descriptive, reference standard or performance requirements, or any combination thereof, but does **not** include proprietary names of Products or manufacturers.
- .4 Substitution means a proposal from a Contractor to provide a Product, material, or item of equipment not specified in the Contract documents but functionally equivalent and readily exchangeable to a specified item; for consideration by Consultant and Owner.

1.4 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 When the Contractor wants to propose a substitute product or when requested by the Consultant, the Contractor is to submit complete data substantiating compliance of a Product with requirements of Contract Documents. Include the following:
 - .1 Product identification, including manufacturer's name and address.
 - .2 Written verification that the substitute Products can be obtained, meet the performance required for the Project, and meet requirements of the Building Code.
 - .3 Manufacturer's literature providing Product description, applicable reference standards, and performance and test data.
 - .4 Samples, as applicable.
 - .5 Name and address of Projects on which Product has been used and date of each installation.
 - .6 For substitutions and requests for changes to accepted Products, include in addition to the above, the following:
 - .1 Itemized comparison of substitution with named Product(s). List significant variations.
 - .2 Designation of availability of maintenance services and sources of replacement materials.

1.5 PRODUCT OPTIONS

- .1 For Products specified by non-proprietary Specification:
 - .1 Select any Product, assembly or material that meets or exceeds the specified standards for Products specified only by referenced standards and performance criteria.
- .2 Acceptable Materials: Select any named Product, assembly or material contained in the listing of Acceptable Materials.
- .3 Basis-of-Design Materials: Use the named Product contained in the Basis-of-Design Material listing, unless an addendum is issued indicating acceptance of additional Acceptable Materials.

1.6 SUBSTITUTIONS

- .1 Contractor will assemble requests for substitutions requested by Subcontractors and submit to Consultant for review.
- .2 Consultant will review proposed substitute Products for acceptability only when submitted by Contractor; Consultant will not review requests submitted independently by Subcontractors.
- .3 No substitutions will be permitted without Consultant's written acceptance; Contractor will be required to remove Products and replace with specified materials or provide a credit to the value of the Contract at Consultant's discretion where substitutions are found in the Work that have not been formally accepted by Consultant and Owner.
- .4 Consultant is not obliged to accept any Proposed Substitution offered by Contractor and reserves the right to dismiss any item with no further explanation.
- .5 Substitute Products: Where substitute Products are permitted, unnamed Products may be accepted by Consultant, subject to the following:
 - .1 Substitute Products shall be the same type as, be capable of performing the same functions as, and meet or exceed the standards of quality and performance of the named Product(s). Substitutions shall not require revisions to Contract Documents nor to Contract Price or Work of Other Contractors.
 - .2 Substitute products life cycle cost shall remain consistent or decrease.
- .6 Substitute Manufacturers: Where substitute manufacturers are permitted, unnamed manufacturers may be accepted by Consultant, subject to the following:
 - .1 Substitute manufacturers shall have capabilities comparable to those of the named manufacturer(s). Substitutions shall not require revisions to Contract Documents nor to Work of Other Contractors.
- .7 In making a proposal for substitution, the Contractor represents:
 - .1 That they have personally investigated the proposal and (unless the proposal explicitly states otherwise) determined that it performs in a similar way or is superior to the Product or method specified.
 - .2 That the same guaranty will be furnished as for the originally specified Product or construction method.
 - .3 That they will coordinate installation of the accepted substitute into the Work, making such changes in the Work as may be required to accommodate the change.
 - .4 That they will bear costs and waives claims for additional compensation for costs and time that subsequently become apparent arising out of the substitution.

Part 1 General

1.1 GENERAL REQUIREMENTS

- .1 Read and conform to Division 01 requirements and documents referred to therein.

1.2 ADMINISTRATIVE REQUIREMENTS

- .1 Contractor shall coordinate Owner supplied Products with the Construction Schedule for delivery dates.
- .2 Contractor shall coordinate with the Owner for installation of Owner installed items, blocking and servicing requirements and confirm dimensional requirements for items being built-in or attached to Contractor's Work.
- .3 Contractor shall coordinate Owner supplied Products, installed by the Contractor for installation requirements, blocking and servicing requirements and confirm dimensional requirements for items being built-in or attached to Contractor's Work.
- .4 Contractor is responsible for Owner supplied items once delivered to Site.

Part 2 Products

2.1 PRE-PURCHASED MATERIALS

- .1 The Owner has ordered and purchased, the following listed items of equipment, to be delivered to the Work site by the equipment manufacturer/vendor. The Contractor shall install the equipment. List as follows:
 - .1 feminine disposal bins,
 - .2 furniture,
 - .3 IT switches,
 - .4 Wireless Access Points (WAPS)
 - .1 Wi-Fi system and wireless access points shall be supplied by Owner. Contractor shall provide two data cable drops for wireless access points and coordinate installations as directed by Owner, see Drawing E4-01 for proposed locations and quantities, see Drawing E7-01 for installation details.
 - .2 Provide horizontal cables for Owner provided wireless access points inside the temporary staff trailer. Contractor

shall provide two data drops for wireless access points
and coordinate installations with Owner.

- .5 1 Number - Dual Head EV Charger (CPF 50)
- .6 1 Number - Dual Head EV Chargers (CT 4000)
- .7 3 Number of Fly Lights
- .8 1 Number – Storage Cabinet for First Aid Room

Part 3 Execution

3.1 PREPARATION

- .1 Contractor shall provide all necessary framing, support and blocking built into walls (or ceiling) to receive pre-purchased equipment and furniture, all services roughing in, in accordance with reviewed Shop Drawings which will be later supplied by the Owner.
- .2 Owner Supplied, Contractor Installed Materials: Contractor shall receive and unload each item, transport it to its designated place of installation and unpack, assemble and install, and connect to building services, and as follows:
 - .1 Owner's Responsibilities:
 - .1 Arrange for delivery of Shop Drawings, Product data, samples, manufacturer's instructions, and certificates to Contractor.
 - .2 Deliver Supplier's bill of materials to Contractor.
 - .3 Arrange and pay for delivery to site in accordance with Progress Schedule.
 - .4 Inspect deliveries jointly with Contractor.
 - .5 Submit claims for transportation damage.
 - .6 Arrange for replacement of damaged, defective or missing items.
 - .7 Arrange for manufacturer's field services; arrange for and deliver manufacturer's warranties and bonds to Contractor.
 - .2 Contractor's Responsibilities:
 - .1 Designate submittals and delivery date for each Product in progress schedule.
 - .2 Review Shop Drawings, Product data, samples, and other submittals. Submit to Consultant notification of any observed discrepancies or problems anticipated due to non-conformance with Contract Documents.
 - .3 Receive and unload Products at site.

- .4 Inspect deliveries jointly with Owner; record shortages, and damaged or defective items.
- .5 Handle Products at site including un-crating and storage.
- .6 Protect Products from damage, and from exposure to elements.
- .7 Assemble, install, connect, adjust, and finish Products.
- .8 Provide installation inspections required by public authorities.
- .9 Repair or replace items damaged by Contractor or Subcontractor on Site (under their control).

END OF SECTION

Part 1 General

1.1 REFERENCES

- .1 Reference Standards:
 - .1 Owner's identification of existing survey control points and property limits.

1.2 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Submit name and address of Surveyor to the Consultant.
- .2 On request of the Consultant, submit documentation to verify accuracy of field engineering Work.
- .3 Submit certificate signed by surveyor certifying and noting those elevations and locations of completed Work that conform and do not conform with Contract Documents.

1.3 QUALITY ASSURANCE

- .1 Qualifications of Surveyor
 - .1 Qualified registered land surveyor, licensed to practice in Place of Work, acceptable to the Consultant.

1.4 SURVEY REFERENCE POINTS

- .1 Existing base horizontal and vertical control points are designated on Drawings.
- .2 Locate, confirm and protect control points prior to starting site Work. Preserve permanent reference points during construction.
- .3 Make no changes or relocations without prior written notice to the Consultant.
- .4 Report to Consultant when reference point is lost or destroyed, or requires relocation because of necessary changes in grades or locations.
- .5 Require surveyor to replace control points in accordance with original survey control.

1.5 SURVEY REQUIREMENTS

- .1 Establish two permanent bench marks on site, referenced to established bench marks by survey control points. Record locations, with horizontal and vertical data in Project Record Documents.
- .2 Establish lines and levels, locate and lay out, by instrumentation.
- .3 Stake for grading, fill and topsoil placement and landscaping features.
- .4 Stake slopes and berms.
- .5 Establish pipe invert elevations.
- .6 Stake batter boards for foundations.
- .7 Establish foundation column locations and floor elevations.
- .8 Establish lines and levels for mechanical and electrical Work.

1.6 EXISTING SERVICES

- .1 Before commencing Work, establish location and extent of service lines in area of Work and notify the Consultant of findings.
- .2 Remove abandoned service lines within 2 m of structures. Cap or otherwise seal lines at cut-off points as directed by the Consultant.

1.7 LOCATION OF EQUIPMENT AND FIXTURES

- .1 Location of equipment, fixtures and outlets indicated or specified are to be considered as approximate.
- .2 Locate equipment, fixtures and distribution systems to provide minimum interference and maximum usable space and in accordance with manufacturer's recommendations for safety, access and maintenance.
- .3 Inform the Consultant of impending installation and obtain approval for actual location.
- .4 Submit field Drawings to indicate relative position of various services and equipment when required by the Consultant.

1.8 RECORDS

- .1 Maintain a complete, accurate log of control and survey Work as it progresses.
- .2 On completion of foundations and major site improvements, prepare a certified survey showing dimensions, locations, angles and elevations of Work.
- .3 Record locations of maintained, re-routed and abandoned service lines.

1.9 SUBSURFACE CONDITIONS

- .1 Promptly notify Consultant in writing if subsurface conditions at Place of Work differ materially from those indicated in Contract Documents, or a reasonable assumption of probable conditions based thereon.
- .2 After prompt investigation, should Consultant determine that conditions do differ materially, instructions will be issued for changes in Work as provided in Changes and Change Orders.

Part 2 Products

2.1 NOT USED

Part 3 Execution

3.1 NOT USED

END OF SECTION

Part 1 General

1.1 GENERAL REQUIREMENTS

- .1 Read and conform to Division 01 requirements and documents referred to therein.

1.2 REFERENCES

- .1 Canadian Construction Documents Committee (CCDC)
 - .1 CCDC 2-2020, Stipulated Price Contract as amended in Contract Documents.

1.3 PROJECT CLEANLINESS

- .1 Maintain Work in tidy condition, free from accumulation of waste products and debris, including that caused by Owner or Other Contractors.
- .2 Remove waste materials from Site at daily regularly scheduled times or dispose of as directed by Consultant. Do not burn waste materials on Site.
- .3 Clear snow and ice from access to building, bank/pile snow in designated areas only.
- .4 Make arrangements with and obtain permits from Authorities Having Jurisdiction for disposal of waste and debris.
- .5 Provide on-Site containers for collection of waste materials and debris.
- .6 Provide and use marked separate bins for recycling. Refer to Section 01 74 19 – Construction Waste Management.
- .7 Dispose of waste materials and debris off Site.
- .8 Clean interior areas prior to start of finishing work, and maintain areas free of dust and other contaminants during finishing operations.
- .9 Store volatile waste in covered metal containers, and remove from premises at end of each working day.
- .10 Provide adequate ventilation during use of volatile or noxious substances. Use of building ventilation systems is not permitted for this purpose.
- .11 Use only cleaning materials recommended by manufacturer of surface to be cleaned, and as recommended by cleaning material manufacturer.
- .12 Schedule cleaning operations so that resulting dust, debris and other contaminants will not fall on wet, newly painted surfaces nor contaminate building systems.

1.4 FINAL CLEANING

- .1 Clean work prior to final review by Consultant.
- .2 When Substantial Performance of the Contract has been achieved, remove surplus products, tools, construction machinery and equipment not required for performance of remaining Work.
- .3 Remove waste in accordance with Section 01 74 19 – Construction Waste Management.

- .4 Remove waste products and debris other than that caused by others, and leave Work clean and suitable for occupancy.
- .5 Prior to final review remove surplus products, tools, construction machinery and equipment.
- .6 Remove waste products and debris including that caused by Owner or Other Contractors.
- .7 Remove waste materials from Site at regularly scheduled times or dispose of as directed by Consultant. Do not burn waste materials on Site, unless approved by Consultant.
- .8 Make arrangements with and obtain permits from Authorities Having Jurisdiction for disposal of waste and debris.
- .9 Clean and polish glass, mirrors, hardware, wall tile, stainless steel, chrome, porcelain enamel, baked enamel, plastic laminate, and mechanical and electrical fixtures. Replace broken, scratched or disfigured glass.
- .10 Remove stains, spots, marks and dirt from decorative work, electrical and mechanical fixtures, furniture fitments, walls, and floors.
- .11 Clean lighting reflectors, lenses, and other lighting surfaces.
- .12 Vacuum clean and dust building interiors, behind grilles, louvres and screens.
- .13 Wax, seal, shampoo or prepare floor finishes, as recommended by manufacturer.
- .14 Inspect finishes, fitments and equipment and ensure specified workmanship and operation.
- .15 Broom clean and wash exterior walks, steps and surfaces; rake clean other surfaces of grounds.
- .16 Remove dirt and other disfiguration from exterior surfaces.
- .17 Clean and sweep roofs, gutters, areaways, and sunken wells.
- .18 Sweep and wash clean paved areas.
- .19 Clean equipment and fixtures to sanitary condition.
- .20 Clean mechanical equipment including replacement of filters.
- .21 Clean roofs, downspouts, and drainage systems.
- .22 Remove debris and surplus materials from crawl areas and other accessible concealed spaces.
- .23 Remove snow and ice from access to building.

1.5 WASTE MANAGEMENT AND DISPOSAL

- .1 Separate waste materials for reuse and recycling in accordance with Section 01 74 19 – Construction Waste Management.

Part 2 Products

2.1 NOT USED

Part 3 Execution

3.1 NOT USED

END OF SECTION

PART 1 GENERAL

1.1 GENERAL INSTRUCTIONS

- .1 Comply with Division 1 requirements and documents referred to herein.

1.2 SUMMARY

- .1 Provide waste management and disposal including but not limited to following:
 - .1 Minimize the amount of solid waste generated by construction, renovation and demolition activities.
 - .2 Of the inevitable solid waste that is generated by CRD activities, identify at least five (5) materials (both structural and non-structural) targeted for diversion; divert a minimum of 75% from landfill (through reuse and recycling).
 - .3 Meet requirements to achieve LEED® v4 BD+C Materials and Resources prerequisite (Construction and Demolition Waste Management Planning) and credit (Construction and Demolition Waste Management).
 - .4 Comply with applicable Environmental Protection Act of Ontario regulations relating to construction waste management including Ontario Regulation 102/94 and Ontario Regulation 103/94.

1.3 RELATED SECTIONS

- .1 Section 01 81 13 General LEED® Requirements.

1.4 REFERENCES

- .1 Ontario Environmental Protection Act. Ontario Regulation 102/94: Waste Audits and Waste Reduction Workplans.
- .2 Ontario Ministry of the Environment, Conservation and Parks (MECP). A Guide to Waste Audits and Reduction Workplans for Construction and Demolition Projects as Required Under Ontario Regulation 102/94.
- .3 Ontario Environmental Protection Act. Ontario Regulation 103/94: Industrial, Commercial and Institutional Source Separation Programs.
- .4 Ontario Ministry of the Environment, Conservation and Parks (MECP). A Guide to Source Separation of Recyclable Materials for Industrial, Commercial and Institutional Sectors and Multi-Unit Residential Buildings as Required Under Ontario Regulation 103/94.
- .5 Canadian Construction Association. Standard Construction Document CCA 27-1997: A Guide on Construction Environmental Management Planning.
- .6 Canadian Construction Association. Standard Construction Document CCA 81-2001: A Best Guide to Solid Waste Reduction.
- .7 Public Works and Government Services Canada. 2002 National Construction, Renovation, and Demolition Non-Hazardous Solid Waste Management Protocol.
- .8 LEED® v4 Reference Guide for Green Building Design and Construction, United States Green Building Council.

1.5 DEFINITIONS

- .1 Solid Waste: Any waste material that is sent from the project site to another location for disposal.
- .2 Land-Clearing Debris: Waste materials resulting from land-clearing that include pre-existing development materials and plant matter, but do not include soil.
- .3 Reused Waste: Waste materials that are sent to a location off-site (e.g. another construction project or product supplier) where they are used in their original form (i.e. without additional processing).
- .4 Recycled Waste: Waste materials that are sent off-site to a recycling facility where they are used to displace virgin materials as feedstock for manufacturing processes that create new products.
- .5 Landfill Waste: Waste materials that are sent to a landfill site for disposal.

1.6 DESCRIPTION OF WORK

- .1 The site superintendent (or other individual designated by Contractor) shall be responsible for all aspects of the Construction Waste Management and Disposal.
- .2 Implement a waste reduction strategy based on the 3R hierarchy: reduce the generation of waste materials at the project site, reuse materials on other construction sites where feasible, and recycle waste materials as feedstock for manufacturing processes that create new products.
- .3 Waste Management responsibilities include:
 - .1 Arranging waste management service agreements with waste haulers and waste receiving facilities.
 - .2 Supervising on-site waste management activities on a daily basis.
 - .3 Coordinating waste management tasks with Subcontractors to ensure timely and orderly progress of the work.
 - .4 Preparing waste management documentation and submittals as described in 3.1 of this section
 - .5 Reporting waste management progress to Consultant.
 - .6 Participating in the LEED® Kick-Off meeting as described in Section 01 81 13 General LEED® Requirements.

1.7 SUBMITTALS

- .1 Construction Waste Management (CWM) Plan
 - .1 The CWM Plan will be site specific, and developed and finalized before the start of any excavation, demolition, or construction activities. The LEED Consultant will provide guidance to ensure compliance. It will include the overall project waste diversion goals, at least 5 kinds of material streams to be diverted, the methods of diversion to be implemented for each of the 5 selected material streams, and the approximate amount of waste of each.
- .2 W1: Proposed Receiving Facilities Form

-
- .1 List the proposed receiving facilities for each in addition to material sent to landfill. Indicate the materials that will be accepted at each facility and the end use of the material (reuse, recycle or landfill).
 - .2 Submit completed schedule to consultant within 14 days of site mobilization.
 - .3 A sample copy of this form has been attached as a supplement at the end of this Section.
 - .3 W2: Waste Tracking Worksheet
 - .1 Obtain waybills, invoices, letters and other documentation that clearly indicates the receiving facility, end use (reused recycled or landfill) and quantity of waste for each shipment using the Waste Tracking Worksheet.
 - .2 Submit completed Waste Tracking Worksheet to the Consultant on a monthly basis as part of the ongoing Monthly LEED Reports required in General LEED Section 01 81 13.
 - .3 A sample copy of this document has been attached as a supplement at the end of this Section.
 - .4 Final CWM Report
 - .1 The final waste report will detail the total construction and demolition waste produced by the project, the types of waste material and quantity of each material, and the total waste diverted and diversion rate. This report should be completed and sent to the LEED consultant subsequent to the completion of all construction activities that may produce waste.

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION

3.1 PROCEDURES

- .1 Waste Reduction:
 - .1 Invite suppliers to retrieve/retain packaging after delivery (for reuse).
 - .2 Prevent damage of materials due to mishandling, improper storage and contamination
 - .3 Use prefabricated assemblies built at a central facility (when possible) to avoid waste generation at site.
- .2 Waste Diversion:
 - .1 Contact local salvaging/recycling facilities and arrange for recycling services. At a minimum, proposed facilities must recycle/reuse following waste materials generated throughout construction:
 - .1 Land clearing debris
 - .2 Asphalt
 - .3 Portland cement concrete/masonry/stone
 - .4 Steel and other metals
 - .5 Wood (see note below)
 - .6 Gypsum

-
- .7 Cardboard
 - .8 Plastic
 - .9 Blue box waste
 - .2 Incineration of wood waste for power generation is not considered as recycling or reuse. Recommended measures for recycling/reusing wood include encouraging suppliers to reuse wood pallets, sending wood pallets to pallet recycling companies and converting waste wood into landscaping mulch.
 - .3 Provide Consultant with a list of proposed salvaging/recycling facilities within 14 Days of site mobilization. List must indicate materials accepted by each facility and whether materials will be reused, recycled or sent to landfill.
 - .4 Designate a central Waste Collection Area onsite dedicated to separation and storage of waste generated during construction.
 - .5 Provide containers in Waste Collection Area sized to accommodate separation and storage of expected waste types and quantities. Provide separate containers for each of following material types:
 - .1 Land clearing debris
 - .2 Asphalt
 - .3 Portland cement concrete/masonry/stone
 - .4 Steel and other metals
 - .5 Wood
 - .6 Gypsum
 - .7 Cardboard
 - .8 Plastic
 - .9 Blue box waste
 - .10 Mixed waste
 - .11 Other types
 - .6 Clearly indicate material type being stored in each container using appropriate signage.
 - .7 Ensure Subcontractors use containers provided in Waste Collection Area.
 - .8 In the event a Subcontractor is unable to use these containers, or wishes to use a waste material on future project (e.g. rubble for road base), Subcontractor must provide waybills, invoices, letters and other documentation clearly indicating receiving facility, end use (reused, recycled or landfill) and quantity of waste in each shipment.
 - .9 Follow salvaging/recycling facilities' material acceptance requirements to ensure materials are properly sorted, grouped and package for collection.
 - .10 Provide blue box recycling bins near construction trailer for recycling waste generated by site workers and visitors. Waste deposited in these bins include:
 - .1 Aluminum food or beverage cans
 - .2 Glass bottles and jars for food or beverage
 - .3 PET bottles for food or beverages

.4 Steel food or beverage cans

.5 Cardboard and paper products

.3 Waste Tracking:

.1 Coordinate delivery of separated materials to approved salvage or recycling facilities.

.2 Retain waybills for inclusion in final Waste Diversion Report.

3.2 INSPECTIONS & MAINTENANCE

.1 Conduct daily inspections of material separation bins to check for and remedy cross-contamination.

.2 Promptly transport containers to receiving facilities when containers are full.

.3 Ensure material type is clearly labeled on each container

3.3 SUPPLEMENTS

.1 The documents listed below, attached following "END OF SECTION", form part of this Specification Section:

.1 Proposed Receiving Facilities Form

.2 Waste Tracking Worksheet

END OF SECTION

W1: PROPOSED WASTE RECEIVING FACILITIES FORM

(Submit to the Consultant within 14 days after site mobilization)

Project Name:		Completed By:	
Project Location:		Company:	

At a minimum, proposed facilities must recycle/reuse the waste materials identified in Section 01 74 19 Waste Management and Disposal:

Material Type	Proposed Receiving Facility		
	Name	Material End Use	Phone Number
Wood Formwork	Wood Diversion Inc. (London, Ontario)	<input checked="" type="checkbox"/> Recycled/Reused <input type="checkbox"/> Sent to Landfill	519-555-5555

W2: WASTE TRACKING WORKSHEET

Project Name:		Completed By:	
Project Location:		Company:	

For the purpose of LEED® documentation, I certify the following information for waste tracking on this Project:

Material Type Legend		
Land Clearing Debris	Asphalt	Concrete/Masonry/Stone
Steel and Other Metals	Wood	Gypsum
Cardboard	Plastic	"Blue Box" Waste
Mixed Waste	Other types as required	

#	Shipment Date	Material Type	Amount of Material (metric tonnes)		Receiving Facility Name	Waybill Number
			Reused or Recycled	Landfill		
EX	2010-06-25	Gypsum	7.0	0.0	Drywall Recycling Inc.	09-1234

I hereby certify that the information provided above is complete and correct:

_____ Signature of Authorized Official	_____ Position	_____ Date
---	-------------------	---------------

Part 1 General

1.1 GENERAL REQUIREMENTS

- .1 Read and conform to Division 01 requirements and documents referred to therein.

1.2 REFERENCES

- .1 Reference Standards:
 - .1 Underwriters' Laboratories of Canada (ULC):
 - .1 ULC 1001-11, Standard for Integrated Systems Testing of Fire Protection and Life Safety Systems (CAN/ULC S1001-11)

1.3 INSPECTION AND DECLARATION

- .1 Contractor's Inspection: Contractor and Subcontractors: conduct inspection of Work, identify deficiencies and defects, and repair as required to conform to Contract Documents.
 - .1 Notify Consultant in writing of satisfactory completion of Contractor's inspection and that corrections have been made.
 - .2 Request Consultant's review.
 - .3 Consultant's Review: Consultant and Contractor will perform inspection of Work to identify obvious defects or deficiencies. Contractor to correct Work accordingly.
- .2 Completion: submit written certificate that following have been performed:
 - .1 Work has been completed and inspected for compliance with Contract Documents.
 - .2 Defects have been corrected and deficiencies have been completed.
 - .3 Equipment and systems have been tested, adjusted and balanced and are fully operational.
 - .4 Certificates required by Technical Standards Safety Authority (TSSA), Electrical Safety Authority (ESA), Fire Commissioner and Utility companies have been submitted.
 - .5 Certification letter required to confirm integrated systems testing for fire protection and life safety systems has been successfully completed in accordance with ULC-1001.
 - .6 Operation of systems have been demonstrated to Owner's personnel.
 - .7 Work is complete and ready for final inspection.
- .3 Final Review: when items noted above are completed, request final inspection of Work by Owner, Consultant, and Contractor. If Work is deemed incomplete by Owner and Consultant, complete outstanding items and request reinspection.
- .4 Declaration of Substantial Performance of the Contract: when Owner and Consultant consider deficiencies and defects have been corrected and it appears requirements of Contract have been substantially performed, make application for certificate of Substantial Performance of the Contract. Refer to General Conditions and Supplementary Conditions for specifics to application.
- .5 Commencement of Warranty Periods: refer to A-13 Articles of Agreement.

- .6 Final Payment: when Owner and Consultant consider final deficiencies and defects have been corrected and it appears requirements of Contract have been totally performed, make application for final payment. If Work is deemed incomplete by Owner and Consultant, complete outstanding items and request reinspection.
- .7 Payment of Holdback: Payment of holdback shall be in accordance with the requirements of the *Construction Act* and processes set out in the General Conditions of the Contract.

1.4 CLEANING

- .1 In accordance with Section 01 74 11 – Cleaning.
- .2 Remove waste and surplus materials, rubbish and construction facilities from the site in accordance with Section 01 74 19 – Construction Waste Management.

Part 2 Products

2.1 NOT USED

Part 3 Execution

3.1 NOT USED

END OF SECTION

Part 1 General

1.1 GENERAL REQUIREMENTS

- .1 Read and conform to Division 01 requirements and documents referred to therein.

1.2 SUBMITTALS

- .1 Submittals: in accordance with Section 01 33 00 Submittal Procedures.
- .2 Provide list of building system assets for each component including equipment type, manufacturer, model number, and condition (for existing equipment). Example of spreadsheet attached at end of this section.
- .3 Prepare instructions and data using personnel experienced in maintenance and operation of described Products.
- .4 Copy will be returned after final review, with Consultant's comments.
- .5 Revise content of documents as required prior to final submittal.
- .6 A minimum of 10 Business Days prior to Substantial Performance of the Contract, submit to the Consultant two final copies of operating and maintenance manuals in English along with pdf version on a flash drive in English.
- .7 Ensure spare parts, maintenance materials and special tools provided are new, undamaged or defective, and of same quality and manufacture as Products provided in Work.
- .8 Furnish evidence, if requested, for type, source and quality of Products provided.
- .9 Defective Products will be rejected, regardless of previous inspections. Replace Products at own expense.
- .10 Pay costs of transportation.
- .11 Submit `redline` marked up construction drawings to the Consultant within 30 Days of Substantial Performance of the Contract and prior to Total Performance of the Contract.

1.3 FORMAT

- .1 Organize data as instructional manual.
- .2 Binders: hard covered, 3 'D' ring, loose leaf 219 x 279 mm with spine and face pockets.
- .3 When multiple binders are used correlate data into related consistent groupings. Identify contents of each binder on spine.
- .4 Cover: identify each binder with type or printed title 'Project Record Documents'; list title of Project and identify subject matter of contents.
- .5 Arrange content by systems, process flow, under Section numbers and sequence of Table of Contents.
- .6 Provide tabbed fly leaf for each separate Product and system, with typed description of Product and major component parts of equipment.
- .7 Text: manufacturer's printed data, or typewritten data.

- .8 Drawings: provide with reinforced punched binder tab. Bind in with text; fold larger drawings to size of text pages.

1.4 CONTENTS EACH VOLUME

- .1 Table of Contents: provide title of project;
 - .1 Date of submission; names.
 - .2 Addresses, and telephone numbers of Consultant and Contractor with name of responsible parties.
 - .3 Schedule of Products and systems, indexed to content of volume.
- .2 For each Product or system:
 - .1 List names, addresses and telephone numbers of Subcontractors and Suppliers, including local source of supplies and replacement parts.
 - .2 Include a summary list of all warranties that apply to the project complete with dates
- .3 Product Data: mark each sheet to identify specific Products and component parts, and data applicable to installation; delete inapplicable information.
- .4 Drawings: supplement Product data to illustrate relations of component parts of equipment and systems, to show control and flow diagrams.
- .5 Typewritten Text: as required to supplement Product data. Provide logical sequence of instructions for each procedure, incorporating manufacturer's instructions specified in Section 01 45 00 Quality Control.
- .6 Training: refer to Section 01 79 00 Demonstration and Training.

1.5 AS-BUILTS AND SAMPLES

- .1 Maintain, in addition to requirements in General Conditions, at site for Consultant one record copy of:
 - .1 Contract Drawings.
 - .2 Specifications.
 - .3 Addenda.
 - .4 Change Orders and other modifications to Contract.
 - .5 Reviewed Shop Drawings, Product data, and samples.
 - .6 Field Test Report, System Components List Complete With Commissioning Verification Forms and Check Sheets and Commissioning Issues/Resolution Log.
 - .7 Inspection certificates.
 - .8 Manufacturer's certificates.
- .2 Store record documents and samples in field office apart from documents used for construction. Provide files, racks, and secure storage.
- .3 Label record documents and file in accordance with Section number listings in List of Contents of this Project Manual. Label each document "PROJECT RECORD" in neat, large, printed letters.
- .4 Maintain record documents in clean, dry and legible condition. Do not use record documents for construction purposes.

- .5 Keep record documents and samples available for inspection by Consultant.

1.6 RECORDING ACTUAL SITE CONDITIONS

- .1 Record information on set of Drawings, and in copy of Project Manual, provided by Consultant.
- .2 Provide felt tip marking pens, maintaining separate colours for each major system, for recording information.
- .3 Record information concurrently with construction progress. Do not conceal Work until required information is recorded.
- .4 Contract Drawings and Shop Drawings: mark each item to record actual construction, including:
 - .1 Measured depths of elements of foundation in relation to finish first floor datum.
 - .2 Measured horizontal and vertical locations of underground utilities and appurtenances, referenced to permanent surface improvements.
 - .3 Measured locations of internal utilities and appurtenances, referenced to visible and accessible features of construction.
 - .4 Field changes of dimension and detail.
 - .5 Changes made by Change Orders.
 - .6 Details not on original Contract Drawings.
 - .7 References to related Shop Drawings and modifications.
- .5 Specifications: mark each item to record actual construction, including:
 - .1 Manufacturer, trade name, and catalogue number of each Product actually installed, particularly optional items and substitute items.
 - .2 Changes made by Addenda and Change Orders.
- .6 Other Documents: maintain manufacturer's certifications, inspection certifications, field test records, required by individual specifications Sections.

1.7 FINAL SURVEY

- .1 Submit final site survey certificate in accordance with Section 01 71 00 Examination and Preparation, certifying that elevations and locations of completed Work are in conformance, or nonconformance with Contract Documents.

1.8 REAL PROPERTY CERTIFICATE

- .1 Supply to the Consultant, as soon as construction of foundations and basic ground floor levels are completed, a survey plan from a registered Ontario Land Surveyor.
- .2 Plan shall show dimensioned building plan at ground level, distance from property lines, and elevation of the floor used as datum.
- .3 This includes all buildings in Contract.

1.9 EQUIPMENT AND SYSTEMS

- .1 Each Item of Equipment and Each System: include description of unit or system, and component parts. Give function, normal operation characteristics, and limiting conditions. Include performance curves, with engineering data and tests, and complete nomenclature and commercial number of replaceable parts.
- .2 Panel board circuit directories: provide electrical service characteristics, controls, and communications.
- .3 Include installed colour coded wiring diagrams.
- .4 Operating Procedures: include startup, breakin, and routine normal operating instructions and sequences. Include regulation, control, stopping, shutdown, and emergency instructions. Include summer, winter, and any special operating instructions.
- .5 Maintenance Requirements: include routine procedures and guide for trouble-shooting; disassembly, repair, and reassembly instructions; and alignment, adjusting, balancing, and checking instructions.
- .6 Provide servicing and lubrication schedule, and list of lubricants required.
- .7 Include manufacturer's printed operation and maintenance instructions.
- .8 Include sequence of operation by controls manufacturer.
- .9 Provide original manufacturer's parts list, illustrations, assembly drawings, and diagrams required for maintenance.
- .10 Provide installed control diagrams by controls manufacturer.
- .11 Provide Contractor's co-ordination drawings, with installed colour coded piping diagrams.
- .12 Provide charts of valve tag numbers, with location and function of each valve, keyed to flow and control diagrams.
- .13 Provide list of original manufacturer's spare parts, current prices, and recommended quantities to be maintained in storage.
- .14 Include test and balancing reports as specified in Section 01 45 00 - Quality Control and 01 91 13 General Commissioning (CX) Requirements.
- .15 Include integrated systems testing reports as specified in Section 01 45 00 - Quality Control and 01 91 13 General Commissioning (CX) Requirements.
- .16 Additional requirements: as specified in individual specification Sections.

1.10 MATERIALS AND FINISHES

- .1 Building Products, Applied Materials, and Finishes: include Product data, with catalogue number, size, composition, and colour and texture designations. Provide information for re-ordering custom manufactured Products.
- .2 Instructions for cleaning agents and methods, precautions against detrimental agents and methods, and recommended schedule for cleaning and maintenance.
- .3 Moisture Protection and Weather Exposed Products: include manufacturer's recommendations for cleaning agents and methods, precautions against detrimental agents and methods, and recommended schedule for cleaning and maintenance.

- .4 Additional Requirements: as specified in individual specifications Sections.

1.11 SPARE PARTS

- .1 Provide spare parts, in quantities specified in individual specification Sections.
- .2 Provide items of same manufacture and quality as items in Work.
- .3 Deliver spare parts to the Site, place and store spare parts in location at the Site as required by the Consultant.
- .4 Receive and catalogue items. Submit inventory listing to Consultant. Include approved listings in Maintenance Manual.
- .5 Obtain receipt for delivered Products and submit prior to final payment.

1.12 MAINTENANCE MATERIALS

- .1 Provide maintenance and extra materials, in quantities specified in individual specification Sections.
- .2 Provide items of same manufacture and quality as items in Work.
- .3 Deliver maintenance materials to Site, place and store maintenance materials in a location as required by the Consultant.
- .4 Receive and catalogue items. Submit inventory listing to Consultant. Include approved listings in Maintenance Manual.
- .5 Obtain receipt for delivered Products and submit to Consultant prior to final payment.

1.13 EXITING SIGNAGE

- .1 Provide computer generated signage for emergency passage exiting of building. Provide minimum 305 x 305 mm size signs to include at locations as required by Authority having Jurisdiction for building exiting.
- .2 Prepare fire safety plan in accordance with Fire Code and local fire bylaw unless specified otherwise by the Owner. Locate in Fire Safety Plan Box. Provide fire key cylinder at location on exterior of building for Entrance by Fire Station Personnel. Provide and coordinate type of storage and location with local Fire Station and Authority Having Jurisdiction.

1.14 SPECIAL TOOLS

- .1 Provide special tools, in quantities specified in individual specification Section.
- .2 Provide items with tags identifying their associated function and equipment.
- .3 Deliver special tools to Site, place and store special tools in a location as required by the Consultant.
- .4 Receive and catalogue items. Submit inventory listing to Consultant. Include approved listings in Maintenance Manual.

1.15 STORAGE, HANDLING AND PROTECTION

- .1 Store spare parts, maintenance materials, and special tools in manner to prevent damage or deterioration.

- .2 Store in original and undamaged condition with manufacturer's seal and labels intact.
- .3 Store components subject to damage from weather in weatherproof enclosures.
- .4 Store paints and freezable materials in a heated and ventilated room.
- .5 Remove and replace damaged Products at own expense and to satisfaction of Consultant.

1.16 WARRANTIES AND BONDS

- .1 Develop warranty management plan to contain information relevant to warranties.
- .2 Submit warranty management plan, 30 Days before planned pre-warranty conference, to Consultant for approval.
- .3 Warranty management plan to include required actions and documents to ensure that Owner receives warranties to which it is entitled.
- .4 Provide plan in narrative form and contain sufficient detail to make it suitable for use by future maintenance and repair personnel.
- .5 Submit, warranty information made available during construction phase, to Consultant for approval prior to each monthly pay estimate.
- .6 Assemble approved information in binder and submit upon acceptance of work. Organize binder as follows:
 - .1 Separate each warranty or bond with index tab sheets keyed to Table of Contents listing.
 - .2 List Subcontractor, Supplier, and manufacturer, with name, address, and telephone number of responsible principal.
 - .3 Obtain warranties and bonds, executed in duplicate by Subcontractors, Suppliers, and manufacturers, within ten days after completion of applicable item of work.
 - .4 Verify that documents are in proper form, contain full information, and are notarized.
 - .5 Co-execute submittals when required.
 - .6 Retain warranties and bonds until time specified for submittal.
- .7 Except for items put into use with Owner's permission, leave date of beginning of time of warranty until Date of Substantial Performance of the Contract is determined.
- .8 Conduct joint 9 month and 18 month warranty inspection, measured from time of acceptance, by Consultant.
- .9 Include information contained in warranty management plan as follows:
 - .1 Roles and responsibilities of personnel associated with warranty process, including points of contact and telephone numbers within the organizations of Contractors, Subcontractors, manufacturers or Suppliers involved.
 - .2 Listing and status of delivery of Certificates of Warranty for extended warranty items, to include roofs, HVAC balancing, pumps, motors,

- transformers, and commissioned systems such as fire protection, alarm systems, sprinkler systems, lightning protection systems.
- .3 Provide list for each warranted equipment, item, feature of construction or system indicating:
 - .1 Name of item.
 - .2 Model and serial numbers.
 - .3 Location where installed.
 - .4 Name and phone numbers of manufacturers or suppliers.
 - .5 Names, addresses and telephone numbers of sources of spare parts.
 - .6 Warranties and terms of warranty: include one-year overall warranty of construction. Indicate items that have extended warranties and show separate warranty expiration dates.
 - .7 Cross-reference to warranty certificates as applicable.
 - .8 Starting point and duration of warranty period.
 - .9 Summary of maintenance procedures required to continue warranty in force.
 - .10 Cross-Reference to specific pertinent Operation and Maintenance manuals.
 - .11 Organization, names and phone numbers of persons to call for warranty service.
 - .12 Typical response time and repair time expected for various warranted equipment.
 - .4 Contractor's plans for attendance at 9 month and 18 month post-construction warranty inspections.
 - .5 Procedure and status of tagging of equipment covered by extended warranties.
 - .6 Post copies of instructions near selected pieces of equipment where operation is critical for warranty and/or safety reasons.
 - .10 Respond in a timely manner to oral or written notification of required construction warranty repair work.
 - .11 Written verification will follow oral instructions. Failure to respond will be cause for the Consultant to proceed with action against Contractor.

1.17 PRE-WARRANTY CONFERENCE

- .1 Meet with Consultant, to develop understanding of requirements of this Section. Schedule meeting prior to contract completion, and at time designated by Consultant.
- .2 Consultant will establish communication procedures for:
 - .1 Notification of construction warranty defects.
 - .2 Determine priorities for type of defect.
 - .3 Determine reasonable time for response.
- .3 Provide name, telephone number and address of licensed and bonded company that is authorized to initiate and pursue construction warranty work action.

- .4 Ensure contact is located within local service area of warranted construction, is continuously available, and is responsive to inquiries for warranty work action.

1.18 WARRANTY TAGS

- .1 Tag, at time of installation, each warranted item. Provide durable, oil and water resistant tag approved by Consultant.
- .2 Attach tags with copper wire and spray with waterproof silicone coating.
- .3 Leave date of acceptance until project is accepted for occupancy.
- .4 Indicate following information on tag:
 - .1 Type of Product/material.
 - .2 Model number.
 - .3 Serial number.
 - .4 Contract number.
 - .5 Warranty period.
 - .6 Inspector's signature.
 - .7 Construction Contractor.

Part 3 Execution

3.1 NOT USED

END OF SECTION

Part 1 General

1.1 SUMMARY

- .1 Section Includes:
 - .1 This Section includes administrative and procedural requirements for instructing and training the Owner's personnel, including the following:
 - .1 Demonstration of operation of systems, subsystems, and equipment.
 - .2 Training in operation and maintenance of systems, subsystems, and equipment.
 - .3 Demonstration and training videos.
 - .2 Related Requirements:
 - .1 Section 01 77 00 - Closeout Procedures, for Substantial Completion and Ready for Takeover procedures, warranties, and final cleaning.
 - .2 Section 01 78 00 – Closeout Submittals, Operation and Maintenance Data, for operation and maintenance manual requirements.
 - .3 Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 1 Specification Sections, apply to this Section.

1.2 ADMINISTRATIVE REQUIREMENTS

- .1 Coordination:
 - .1 Coordinate instruction and training schedule with the Owner's operations. Adjust schedule as required to minimize disrupting Owner's operations.
 - .2 Coordinate instructors, including providing notification of dates, times, length of instruction time, and course content.
 - .3 Coordinate content of training modules with content of approved emergency, operation, and maintenance manuals. Do not submit instruction program until operation and maintenance data has been reviewed and approved by the Consultant, Contractor, and Commissioning Authority.
 - .4 Coordinate with requirements specified in Section 01 91 13 - General Commissioning (CX) Requirements.

1.3 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Instruction Program: Submit two copies of outline of instructional program for demonstration and training, including a schedule of proposed dates, times, length of instruction time, and instructors' names for each training module. Include learning objective and outline for each training module.
 - .1 Indicate proposed training modules using manufacturer-produced demonstration and training video recordings for systems, equipment, and Products in lieu of recording of live instructional module.
- .2 Qualification Data: For facilitator, instructor, and videographer.
- .3 Attendance Record: For each training module, submit list of participants and length of instruction time.

- .4 Evaluations: For each participant and for each training module, submit results and documentation of performance-based test.

1.4 CLOSEOUT SUBMITTALS

- .1 Demonstration and Training Recordings: Submit two copies within seven days of end of each training module.
 - .1 Identification: On each copy, provide an applied label with the following information:
 - .1 Name of the Owner.
 - .2 Name of Project.
 - .3 Name and address of videographer.
 - .4 Name of Contractor.
 - .5 Date of recording.
 - .2 Transcript: Prepared and bound in format matching operation and maintenance manual. Mark appropriate identification on front and spine of each binder. Include a cover sheet with same label information as the corresponding recording. Include name of Project and date of recording on each page.
 - .3 At completion of training, submit complete training manual(s) for Owner's use, prepared and bound in format matching operation and maintenance manual.

1.5 QUALITY ASSURANCE

- .1 Facilitator Qualifications: A firm or individual experienced in instructing maintenance personnel in a training program similar in content and extent to that indicated for this Project, and whose Work has resulted in training or education with an established record of successful learning performances.
- .2 Instructor Qualifications: A manufacturer's factory-authorized technical service representative, complying with requirements in Section 01 45 00 - Quality Control, and experienced in operation and maintenance procedures and training.
- .3 Videographer Qualifications: A professional videographer who is experienced photographing demonstration and training events similar to those required.
- .4 Pre-Instruction Conference: Conduct conference at Project site to comply with requirements specified in Section 01 31 13 – Mechanical and Electrical Project Coordination. Review methods and procedures related to demonstration and training including, but not limited to, the following:
 - .1 Inspect and discuss locations and other facilities required for instruction and training.
 - .2 Review and finalize instruction and training schedule and verify availability of educational materials, instructors' personnel, audiovisual equipment, and facilities needed to avoid delays.
 - .3 Review required content of instruction and training.
 - .4 For instruction and training that must occur outside, review weather and forecasted weather conditions and procedures to follow if conditions are unfavorable.

Part 2 Products

2.1 INSTRUCTION PROGRAM

- .1 Program Structure: Develop an instruction program that includes individual training modules for each system and equipment not part of a system, as required by individual Specification Sections in Division 2 through Division 33.
- .2 Training Modules: Develop a learning objective and teaching outline for each module. Include a description of specific skills and knowledge that participant is expected to master. For each module, include instruction for the following:
- .3 Basis of System Design, Operational Requirements, and Criteria: Include the following:
 - .1 System, subsystem, and equipment descriptions.
 - .2 Performance and design criteria if Contractor is delegated design responsibility.
 - .3 Operating standards.
 - .4 Regulatory requirements.
 - .5 Equipment function.
 - .6 Operating characteristics.
 - .7 Limiting conditions.
 - .8 Performance curves.
- .4 Documentation: Review the following items in detail:
 - .1 Emergency manuals.
 - .2 Operations manuals.
 - .3 Maintenance manuals.
 - .4 Project Record Documents.
 - .5 Identification systems.
 - .6 Warranties and bonds.
 - .7 Maintenance service agreements and similar continuing commitments.
- .5 Emergencies: Include the following, as applicable:
 - .1 Instructions on meaning of warnings, trouble indications, and error messages.
 - .2 Instructions on stopping.
 - .3 Shutdown instructions for each type of emergency.
 - .4 Operating instructions for conditions outside of normal operating limits.
 - .5 Sequences for electric or electronic systems.
 - .6 Special operating instructions and procedures.
- .6 Operations: Include the following, as applicable:
 - .1 Startup procedures.
 - .2 Equipment or system break-in procedures.
 - .3 Routine and normal operating instructions.
 - .4 Regulation and control procedures.
 - .5 Control sequences.

- .6 Safety procedures.
- .7 Instructions on stopping.
- .8 Normal shutdown instructions.
- .9 Operating procedures for emergencies.
- .10 Operating procedures for system, subsystem, or equipment failure.
- .11 Seasonal and weekend operating instructions.
- .12 Required sequences for electric or electronic systems.
- .13 Special operating instructions and procedures.
- .7 Adjustments: Include the following:
 - .1 Alignments.
 - .2 Checking adjustments.
 - .3 Noise and vibration adjustments.
 - .4 Economy and efficiency adjustments.
- .8 Troubleshooting: Include the following:
 - .1 Diagnostic instructions.
 - .2 Test and inspection procedures.
- .9 Maintenance: Include the following:
 - .1 Inspection procedures.
 - .2 Types of cleaning agents to be used and methods of cleaning.
 - .3 List of cleaning agents and methods of cleaning detrimental to Product.
 - .4 Procedures for routine cleaning
 - .5 Procedures for preventive maintenance.
 - .6 Procedures for routine maintenance.
 - .7 Instruction on use of special tools.
- .10 Repairs: Include the following:
 - .1 Diagnosis instructions.
 - .2 Repair instructions.
 - .3 Disassembly; component removal, repair, and replacement; and reassembly instructions.
 - .4 Instructions for identifying parts and components.
 - .5 Review of spare parts needed for operation and maintenance.

Part 3 Execution

3.1 PREPARATION

- .1 Assemble educational materials necessary for instruction, including documentation and training modules. Assemble training modules into a training manual organized in coordination with requirements in Section 01 78 00 – Closeout Submittals.
- .2 Set up instructional equipment at instruction location.

3.2 INSTRUCTION

- .1 Facilitator: Engage a qualified facilitator to prepare instruction program and training modules, to coordinate instructors, and to coordinate between Contractor and Owner for number of participants, instruction times, and location.
- .2 Engage qualified instructors to instruct Owner's personnel to adjust, operate, and maintain systems, subsystems, equipment, and components not part of a system.
 - .1 The Owner will furnish Contractor with names and positions of participants.
- .3 Scheduling: Provide instruction at mutually agreed on times. For equipment that requires seasonal operation, provide similar instruction at start of each season.
 - .1 Schedule training with the Owner, through Contractor, with at least seven (7) days' advance notice.
- .4 Training Location and Reference Materials: Conduct training on-site in the completed and fully operational facility using the actual systems, subsystems, and equipment in-place. Conduct training using final operation and maintenance manual submittals and additional reference materials as necessary to support the educational objectives.
- .5 Evaluation: At conclusion of each training module, assess and document each participant's mastery of module by use of a written and performance-based test.
- .6 Cleanup: Collect used and leftover educational materials and remove from Project site. Remove instructional equipment. Restore systems and equipment to condition existing before initial demonstration and training use.

3.3 DEMONSTRATION AND TRAINING VIDEOS

- .1 General: Engage a qualified commercial videographer to record demonstration and training videos. Record each training module separately. Include classroom instructions and demonstrations, board diagrams, and other visual aids, but not student practice.
 - .1 At beginning of each training module, record each chart containing educational objectives and lesson outline.
- .2 Format: Provide typical resolution converted to format file type acceptable to the Owner, on portable USB flash drive
- .3 Recording: Mount camera on tripod before starting recording, unless otherwise necessary to show area of demonstration and training. Display continuous running time.
- .4 Lighting Levels: Verify ambient lighting levels are adequate to properly light equipment. Verify equipment markings are clearly visible prior to recording. Furnish additional portable lighting equipment as necessary to provide adequate lighting levels.
- .5 Narration: Describe scenes on video by audio narration by microphone while video is recorded. Include verbal descriptions of items being viewed. Repeat recording procedures where audio is unintelligible.

- .6 Transcript: Provide a printed transcript of the narration. Display images and running time captured from video opposite the corresponding narration segments.
- .7 Pre-Produced Recordings: Provide recordings used as a component of training modules in same format as recordings of live training sessions.

END OF SECTION

PART 1 – General

1.1 GENERAL INSTRUCTIONS

- .1 Comply with Division 1 requirements and documents referred to herein.

1.2 SUMMARY

- .1 Work included: Provide general LEED® requirements including but not limited to following:
 - .1 Construct a building that uses land, water, energy, and material resources appropriately and efficiently and provides a safe, comfortable and productive indoor environment for building occupants in accordance with LEED® requirements.
 - .2 Provide documentation to Consultant as needed to demonstrate LEED® requirements have been met.
 - .3 Achieve certification under LEED® v4 Green Building Design and Construction Rating System administered by the United States Green Building Council.
 - .4 Take reasonable steps to ensure that the building is eligible to be LEED® Silver certified, where the minimum of 50 credits shall be achieved.

1.3 RELATED SECTIONS

- .1 Section 01 91 13 General Commissioning Requirements
- .2 Section 01 61 00 LEED® Product Requirements
- .3 Section 01 74 19 Construction Waste Management
- .4 Section 01 81 19 Indoor Air Quality
- .5 Section 01 57 00 Erosion and Sedimentation Control

1.4 REFERENCES

- .1 LEED® v4 Reference Guide for Green Building Design and Construction, United States Green Building Council.

1.5 DEFINITIONS

- .1 LEED®: Leadership in Energy and Environmental Design is a voluntary, consensus-based, market-responsive set of criteria that evaluate project performance from a whole-building perspective.
- .2 USGBC: United States Green Building Council is a broad-based inclusive coalition of representatives from different segments of the design and building industry. The Council works to change industry standards, develop best design practices and guidelines; advocate for green buildings, and develop educational tools to support its members in implementing sustainable design and construction practices.

1.6 DESCRIPTION OF WORK

- .1 Designate an individual responsible for LEED® coordination during construction.

- .2 LEED® Construction responsibilities include:
 - .1 Coordinating with trades and ensuring successful implementation of LEED® strategies, programs and plans.
 - .2 Reporting construction activity progress to Consultant as it relates to LEED® features in the Project.
 - .3 Supplying the LEED® documentation and submittals outlined within this specification and related sections to the Consultant to demonstrate that LEED® requirements have been met.
- .3 The LEED® Construction Coordinator is to be regularly on-site during construction.

1.7 LEED® KICK-OFF MEETING

- .1 Prior to the start of construction, Contractor shall hold a kick-off meeting with Consultant to review LEED® requirements. This meeting includes a review of:
 - .1 LEED® certification and performance objectives.
 - .2 LEED® requirements and procedures.
 - .3 LEED® postings and submittals.
- .2 The Contractor shall ensure that all appropriate Sub-Contractors attend the meeting as requested by the Consultant.

1.8 SUBMITTALS

- .1 Monthly LEED Reports:
 - .1 Within 10 working days after the end of each month, the Contractor shall submit a Monthly LEED® Report to the Consultant. The report shall include the following items:
 - .1 Erosion and Sedimentation Control Inspection Logs and photographs as required in Section 01 57 00
 - .2 Waste Tracking Worksheet as required in Section 01 74 19.
 - .3 IAQ Management Inspection Forms as required in Section 01 81 19 (after the building reaches close-in).
- .2 Photographs:
 - .1 Ensure photos taken for LEED® documentation purposes conform to following requirements:
 - .1 Resolution: High resolution digital images (1280 x 1024 or higher).
 - .2 Date Stamp: Standard indicating YYYY-MM-DD.
- .3 Provide submittals as outlined in Sections relating to LEED®. Submit these schedules to Consultant for approval.
- .4 Consultant will complete and provide Contractor with LEED® Letter Templates required for LEED® submission package. Contractor will then review and sign LEED® Letter Templates provided and submit to Consultant.

1.9 CREDIT SUMMARY TABLE

- .1 The project shall meet the requirements of the following LEED® credits:
- .2 Prerequisites have been identified.
- .3 The “Pursued” column indicates the credits and number of points that the project currently includes within the scope of works.
- .4 The “Pending” column indicates the credits and number of points that the project is very likely to Pursue and should be included within the scope of works.
- .5 The “Not Pursued” column indicates the credits and number of points that the project is not pursuing and should not to be included within the scope of works.

END OF SECTION

PART 1 – GENERAL

1.1 GENERAL INSTRUCTIONS

- .1 Comply with Division 1 requirements and documents referred to herein.

1.2 SUMMARY

- .1 Provide indoor air quality requirements including but not limited to following:
 - .1 Meet or exceed recommended Design Approaches of the Sheet Metal and Air Conditioning Contractors Association (SMACNA) IAQ Guidelines for Occupied Buildings under Construction, 2nd Edition, 2007, Chapter 3.
 - .2 Protect construction workers and future building occupants from indoor air quality problems resulting from construction activities and building materials.
 - .3 Reduce production and circulation of pollutants during construction.
 - .4 Protect equipment and absorptive materials stored and installed on-site from moisture, dust and dirt accumulation during construction.
 - .5 Prohibit the use of tobacco products inside the building and within 25 feet (7.5 metres) of the building entrance during construction.
 - .6 Prepare building for occupancy following construction.

1.3 RELATED SECTIONS

- .1 Section 01 81 13 General LEED® Requirements.

1.4 REFERENCES

1.5 DEFINITIONS

- .1 Volatile Organic Compounds (VOCs): Organic chemicals that produce vapors readily at room temperature and normal atmospheric pressure (e.g. gasoline, solvents, etc.). VOCs react with sunlight and nitrogen to form ground-level ozone, a chemical that has detrimental effect on human health, agricultural crops, forests, soil, groundwater and ecosystems.
- .2 Composite Wood and Agrifiber Products: Defined as particle board, medium density fiberboard (MDF), plywood, wheatboard, strawboard, panel substrates and door cores.

1.6 DESCRIPTION OF WORK

- .1 The Site Superintendent (or other person designated by Contractor) is responsible for LEED® coordination (during construction) related to indoor air quality management.
- .2 Indoor air quality management activities include:
 - .1 Identifying, implementing and documenting measures to achieve indoor air quality management objectives.
 - .2 Supervising on-site indoor air quality management activities on a daily basis.
 - .3 Coordinating indoor air quality management tasks with Subcontractors to ensure timely and orderly progress of the work.
 - .4 Conducting indoor air quality management inspections and making necessary repairs.
 - .5 Maintaining an indoor air quality inspection log to document observations, deficiencies and corrective actions.
 - .6 Preparing indoor air quality management documentation and submittals as detailed herein.
 - .7 Selecting Products/materials meeting requirements specified herein.
 - .8 Providing product and material documentation and submittals to Consultant as detailed herein prior to ordering a Product or material.
 - .9 Reporting indoor air quality management progress to Consultant.
 - .10 Coordination and scheduling of Indoor Air Quality Testing as required for LEED as outlined in part 3.9 of this section
 - .11 Participating in the LEED® Kick-Off meeting as described in Section 01 81 13 General LEED® Requirements.

1.7 SUBMITTALS

- .1 Construction Indoor Air Quality (IAQ) Management Plan:

- .1 No less than one week prior to the LEED® Coordination Meeting, prepare and submit a Construction Indoor Air Quality (IAQ) Management Plan for review by the Consultant. Revise and resubmit the plan as required by the Consultant.
- .2 The Construction IAQ Management Plan shall address the following:
 - .1 Describe how the project will meet the requirements of this Section and recommended design approaches of the SMACNA IAQ Guidelines for Occupied Buildings under Construction, 2nd Edition, 2007, Chapter 3.
 - .2 Address the non-smoking policy during construction.
 - .3 Describe how the project will achieve compliance with the LEED® Construction Indoor Air Quality Management Plan credit and meet the post-construction, pre-occupancy IAQ requirements described in this Section.
- .2 IAQ 1: Low-Emitting Materials Calculator (appended to this Section):
 - .1 Complete the calculator and collect supporting documentation (SDS, Product data sheets, letter from manufacturers, general emissions evaluation, etc.) to document emission rates for adhesives, sealants, paints, coatings, flooring systems, composite wood products, and ceilings, walls, thermal, and acoustic insulation applied on-site that fall within the building weather barrier.
 - .2 Complete form to document quantities of adhesives, sealants, paints, coatings, flooring systems, and composite wood products applied on-site that fall within the building weather barrier.
 - .3 Submit completed forms and supporting product literature to Consultant for review at least 14 Days prior to ordering.
 - .4 Ensure Contractor and/or Subcontractor verifies specified products forming part of their work meet the requirements of this Section. Report conflicts between these requirements and specified Products to Consultant immediately.
- .3 IAQ 2: IAQ Management Inspection Form (appended to this Section):
 - .1 Contractor (or other person(s) delegated by Contractor) must complete the inspection form on a bi-weekly basis. Commence inspections when building ductwork is being installed and building is enclosed and carry through to building turnover. Submit completed IAQ Management Inspection Forms to the Consultant on a monthly basis as part of the ongoing Monthly LEED Reports required in Section 01 81 13 – General LEED Requirements.
 - .2 Submit a final copy of all completed inspection forms to Consultant after construction and prior to Contractor demobilization.
- .4 IAQ 3: Photo Documentation Checklist (appended to this Section):
 - .1 Ensure Contractor (or other person(s) delegated by Contractor) provides photographs as specified in checklist.
 - .2 Photographs must be included for each bi-weekly IAQ Inspection during construction to demonstrate continuous compliance.
 - .3 Photographs must be accompanied by date taken and a description of indoor air quality management measure depicted.

.5 Filtration Media Documentation:

- .1 In the event that permanent HVAC equipment is operated during construction, the Contractor shall submit documentation to the Consultant for review and approval prior to installation of filtration media. Documentation must demonstrate that all filtration media used over return air grills or ducts has a Minimum Efficiency Reporting Value (MERV) of 8. The Contractor shall not use any filtration media for this use until receiving approval from the Consultant.

PART 2 PRODUCTS

2.1 ALL PRODUCTS

- .1 All building products and materials that must be considered for the LEED® Low Emitting Materials credit are divided into seven categories:
- .1 Interior paints and coatings applied on site
 - .2 Interior adhesives and sealants applied on site (including flooring adhesive)
 - .3 Flooring
 - .4 Composite wood
 - .5 Ceilings, walls, thermal, and acoustic insulation
 - .6 Furniture (only included if part of scope of work)
 - .7 Exterior applied products (only applicable to healthcare and school projects)
- .2 All building products that fall into categories 1 to 5, as listed above, must meet the specific emissions and content requirements described herein.

2.2 INTERIOR PAINTS AND COATINGS

- .1 Interior paints and coatings applied on-site and within the building weather barrier must have a General Emissions Evaluation completed; these products must be tested and determined compliant in accordance with California Department of Public Health (CDPH) Standard Method v1.2-2017.
- .2 Interior paints and coatings applied on site and within the building weather barrier must also must meet the applicable VOC limits of the South Coast Air Quality Management District (SCAQMD) Rule 1113.
- .3 VOC content limits of SCAQMD Rule 1113 are as follows:

Coatings	
Category	VOC Limit (grams/litre)
Clear Wood Finish, Lacquer	550
Clear Wood Finish, Sanding Sealer	350

Clear Wood Finish, Varnish	350
Clear Brushing Lacquer	680
Floor Coatings	100
Sealers and Undercoaters	200
Shellac: Clear	730
Shellac: Pigmented	550
Stain	250
Concrete-Curing Compounds	350
Japans/Faux Finishing Coatings	350
Magnesite Cement Coatings	450
Pigmented Lacquer	550
Waterproofing Sealers	250
Waterproofing Concrete/Masonry Sealers	400
Wood Preservatives	350
Low Solids Coatings	120 (incl. water)

- .4 Submit supporting documentation for all interior paints and coatings applied onsite and within the building weather barrier.

2.3 INTERIOR ADHESIVES AND SEALANTS

- .1 Interior adhesives and sealants applied on-site and within the building weather barrier must have a General Emissions Evaluation completed; these products must be tested and determined compliant in accordance with California Department of Public Health (CDPH) Standard Method v1.2-2017.
- .2 Interior adhesives and sealants applied on site and within the building weather barrier must also must meet the applicable VOC limits of the South Coast Air Quality Management District (SCAQMD) Rule 1168.
- .3 VOC content limits of SCAQMD Rule 1168 are as follows:

Architectural Adhesives

Category	VOC Limit (grams/litre)
Indoor Carpet Adhesive	50
Carpet Pad Adhesive	50

Wood Flooring Adhesive	100
Rubber Floor Adhesive	60
Subfloor Adhesive	50
Ceramic Tile Adhesive	65
VCT and Asphalt Tile Adhesive	50
Drywall and Panel Adhesive	50
Cove Base Adhesive	50
Multipurpose Construction Adhesive	70
Structural Glazing Adhesive	100

Specialty Adhesives

Category	VOC Limit (grams/litre)
PVC Welding	510
CPVC Welding	490
ABS Welding	325
Plastic Cement Welding Adhesive	250
Adhesive Primer for Plastic	550
Contact Adhesive	80
Special Purpose Contact Adhesive	250
Structural Wood Member Adhesive	140
Sheet Applied Rubber Lining Operations	850
Top and Trim Adhesive	250

Substrate Specific Adhesives

Category	VOC Limit (grams/litre)
Metal to Metal Adhesive	30

Plastic Foam Adhesive	50
Porous Material (except wood) Adhesive	50
Wood Adhesive	30
Fibreglass Adhesive	80

Sealants

Category	VOC Limit (grams/litre)
Architectural Sealant	250
Non-membrane Roof Sealant	300
Roadway Sealant	250
Single-Ply Roof Membrane Sealant	450
Other Sealant	420

Sealant Primers

Category	VOC Limit (grams/litre)
Architectural, Non-Porous Sealant Primer	250
Architectural, Porous Sealant Primer	775
Other Sealant Primer	750

- .4 Submit supporting documentation for all adhesives and sealants applied onsite and within the building weather barrier.

2.4 FLOORING

- .1 Interior flooring systems must have a General Emissions Evaluation completed; these products must be tested and determined compliant in accordance with California Department of Public Health (CDPH) Standard Method v1.2-2017.

- .2 If flooring systems are made from naturally occurring, inorganic materials (i.e.: granite, untreated and unfinished solid wood, etc.), such products do not need to undergo VOC testing and can be deemed as inherently non-emitting materials.
- .3 Submit supporting documentation required for all applicable flooring systems used in the building.

2.5 COMPOSITE WOOD

- .1 Composite wood must be documented to have low formaldehyde emissions that meet the California Air Resources Board (CARB) 93120 Airborne Toxic Control Measure (ATCM). The requirements for ultra-low-emitting formaldehyde (ULEF) resins or no added formaldehyde resins apply.
- .2 Submit supporting documentation as required for all composite wood used in the building.

2.6 CEILINGS, WALLS, THERMAL, AND ACOUSTIC INSULATION

- .1 Ceilings, walls, thermal and acoustic insulation products must have a general emissions evaluation completed; these products must be tested and determined compliant in accordance with California Department of Public Health (CDPH) Standard Method v1.2-2017.
- .2 Submit supporting documentation as required for all ceilings, walls, thermal and acoustic insulation products used in the building.

2.7 FILTRATION MEDIA REQUIREMENTS

- .1 Air filter minimum efficiency reporting value (MERV) ratings shall be determined by ASHRAE 52.2-2007.
- .2 Air handling equipment not used during construction:
 - .1 Install filters as per mechanical specifications
- .3 Air handling equipment used during construction:
 - .1 Install filters as per mechanical specifications
 - .2 Install new filters with a minimum MERV 8 rating at all return and exhaust grills and inlets before any HVAC system is operated
 - .3 Replace all air handling filtration media prior to building occupancy
 - .4 Submit supporting documentation as required for all filtration media used during construction.

PART 3 EXECUTION

3.1 POLLUTANT SOURCE IDENTIFICATION

- .1 Identify potential sources of indoor air pollutants on construction site.

- .2 Any construction activity or material producing odour and/or dust is considered a source of air pollutant. Pollutant sources include but are not limited to:
 - .1 Materials producing detectable odour such as paints, stains, grouts, cleaning products, fuels, caulking, and sealants.
 - .2 Materials creating dust such as concrete products, gypsum board, wood products, tile, and acoustic ceiling panels.
 - .3 Equipment emitting products of combustion or creating odour and/or dust such as generators, compressors, soldering guns, portable heaters, vehicles, and welding equipment.
 - .4 Construction activities disrupting pollutants such as demolition, repairs, and renovations.

3.2 MINIMIZE POLLUTANTS

- .1 Minimize pollutants generated inside building from sources identified under "Pollutant Source Identification" using following measures:
 - .1 Prohibiting smoking inside building at all times during construction.
 - .2 Fuelling up equipment outside building.
 - .3 Storing gasoline or solvents outside building.
 - .4 Restricting outdoor vehicular/equipment traffic and operation where emissions can enter building.
 - .5 Reducing on-site emissions by using equipment that burns propane/natural gas or is powered by electricity.
 - .6 Exhausting pollutant sources directly outside using temporary or permanent ventilation equipment. Where exhaust is not feasible, locally re-circulate air through a portable air cleaner.
 - .7 Collecting and bagging sawdust from woodworking tools.
 - .8 Covering and/or sealing indoor sources of odour and dust.
 - .9 Using painting techniques minimizing odour (e.g. roller instead of spraying).
 - .10 Using cleaning practices minimizing dust (e.g. vacuum instead of sweeping).
 - .11 Using cleaning Products minimizing pollution, fumes, VOC's, etc.
 - .12 Prohibiting burning of garbage

3.3 POLLUTANT CONTAINMENT MEASURES

- .1 Prevent movement of pollutants from sources identified under "Pollutant Source Identification" to other areas in building using following measures:
- .2 When possible, perform pollutant generating activities outside building. :
- .3 Move equipment, work and other pollutant sources to locations where they will have minimum impact on indoor air quality.

- .4 Setup small, contained, designated work areas to contain pollutants.
- .5 Avoid open areas and areas with high drafts.
- .6 Erect dust curtains and barriers.
- .7 Depressurize areas using temporary or permanent ventilation equipment
- .8 Use portable fans to exhaust pollutants (e.g. gas engine exhaust) to exterior through windows, doors, etc. Ensure adjacent windows, doors, etc. will not allow pollutants to re-enter building.
- .9 Close windows and doors adjacent to pollutant sources (e.g. dust, vehicle emissions, etc.) outside of building. If windows and doors have not been installed, temporarily seal exterior openings with plastic, wood, etc.
- .10 Pressurize occupied or completed areas of building using temporary or permanent ventilation equipment.

3.4 HOUSEKEEPING MEASURES

- .1 Prevent accumulation of moisture, dust and dirt in building from sources identified under "Pollutant Source Identification" using following measures:
 - .1 Frequently cleaning interior surfaces to minimize dust and dirt accumulation by:
 - .1 Dusting with damp rags.
 - .2 Wet mopping.
 - .3 Sweeping using wetting agents and sweeping compounds
 - .4 Vacuuming with equipment containing HEPA filtration and/or a wet scrubber.
 - .5 Localized cleaning should occur immediately after a construction activity is completed and/or at end of each Day. Perform a full building clean-up at least once a week
 - .2 Close exterior windows and doors or create temporary enclosures using plastic or wood to prevent moisture accumulation indoors.
 - .3 Immediately remove any water accumulated indoors to protect interior surfaces and materials.
 - .4 Cover, seal and protect materials stored and installed on-site from moisture, dust and dirt accumulation.
 - .5 Elevate materials stored on-site off ground to protect from moisture and dirt accumulation.
 - .6 Do not install materials with evidence of moisture damage or excessive moisture accumulation.
 - .7 Use ventilation/dehumidification to control humidity levels within the building, if necessary
 - .8 Promptly clean spills (fuels, lubricants, paints, adhesives, etc.).
 - .9 Clean or remove excess application of solvent-containing Products

3.5 HVAC PROTECTION MEASURES

- .1 During/Before Installation
 - .1 Cover (with plastic) and elevate (off ground) ductwork, fittings, insulation, acoustic lining and equipment stored on site during construction.
 - .2 Seal supply, return and exhaust openings as well as temporary ductwork openings not under immediate work (e.g. open ends in ductwork runs) with plastic. Seal openings immediately after installation in areas that will no longer be under work.
 - .3 Close/cover hatches and access doors in HVAC equipment that will not be under work.
 - .4 Seal HVAC equipment openings (e.g. inlets/outlets of air handlers, fans, VAV boxes, etc.) with plastic until ductwork is connected.
 - .5 Do not use mechanical rooms to store or collect construction waste materials.
 - .6 Install ceiling tiles and seal openings into plenum with plastic prior to final cleaning.
- .2 After Installation (select Option 1 or Option 2 for each HVAC system):
 - .1 Option 1: HVAC Equipment Not Used During Construction (Recommended):
 - .1 Do not operate any permanent HVAC equipment or systems during construction.
 - .2 Seal openings in HVAC systems, ductwork and plenums.
 - .3 If HVAC system protection measures are not implemented, or if system is operated during construction, Contractor must provide duct cleaning services, plus necessary access doors, at no extra cost to Contract.
 - .4 After construction and final cleaning work is complete Contractor shall:
 - .1 Remove HVAC protection measures.
 - .2 Install new filters in air handling equipment.
 - .3 Start-up systems.
 - .4 Prepare systems for Testing, Adjusting and Balancing Contractor and Commissioning Agent.
 - .2 Option 2: HVAC Equipment Used During Construction:
 - .1 Install new filters in air handling equipment before any HVAC system is operated. Provide a duct-mounted filter (external to equipment) if necessary.
 - .2 Install new filters with a minimum MERV 8 rating at return and exhaust grilles and inlets before any HVAC system is operated.
 - .3 Temporarily shut down return/exhaust side of HVAC systems during heavy construction/demolition.
 - .4 Permanently close off return/exhaust side of HVAC systems in areas with high dust levels. Cover duct openings with plastic in these areas.

- .5 If HVAC system is operated without above protection measures in place, Contractor must provide duct cleaning services, plus necessary access doors, at no extra cost to Contract.
- .6 After construction and final cleaning work is complete Contractor shall:
 - .1 Remove temporary filters installed on return grilles.
 - .2 Install new filters in air handling equipment.
 - .3 Prepare systems for Testing, Adjusting and Balancing Contractor and Commissioning Agent.

3.6 SCHEDULING

- .1 Schedule construction activities to minimize amount of VOC's, odours and fumes absorbed by porous materials (e g ceiling tiles, carpet, etc.).
- .2 Complete applications of wet and odorous materials such as paints, sealants and coatings before installing absorbent "sink" materials such as ceiling tiles, carpets and fabric-covered furnishings.
- .3 Allow for Testing, Adjusting and Balancing to be carried out following construction and before occupancy (refer to HVAC Protection Measures).
- .4 Allow for corrective work related to general deficiencies, Testing, Adjusting and Balancing, and is Commissioning to be carried out following construction and before occupancy.

3.7 INSPECTIONS AND MAINTENANCE

- .1 Inspect indoor air quality management measures and remedy any deficiencies on a weekly basis.
- .2 Record inspections using the IAQ Management Inspection Form and denote measures implemented at time of inspection, any deficiencies as well as corrective actions taken.
- .3 Provide photos using the Photo Documentation Checklist at various occasions during construction to demonstrate continuous compliance.
- .4 Pollutant containment, housekeeping and HVAC protection measures will be reviewed by the Consultant during each site visit.
- .5 Deficiencies identified by the Consultant must be remedied and documented in the IAQ Management Inspection Form within 48 hours of notification.
- .6 Clean or replace any equipment or materials incorrectly stored or improperly protected at no extra cost to the Contract.

3.8 REMOVAL OF PROTECTION MEASURES

- .1 Remove products/materials installed as a part of indoor air quality management measures prior to the building turnover. Any remedial work required as a result of removing measures is responsibility of Contractor.

3.9 PRE-OCCUPANCY IAQ TESTING

- .1 Post construction/pre-occupancy IAQ testing is to be conducted by a separate testing agent. The testing agent is to be retained and coordinated by the Contractor.
- .2 It is the Contractor's responsibility to allow for the scheduling of the required IAQ testing following construction and prior to occupancy in the areas identified by the testing agent.
- .3 Testing shall include the minimum number of sampling locations as provided by the LEED Consultant including all occupied spaces and no less than one sampling location per floor. Sample locations should be evenly distributed throughout the building to obtain representation for all areas.
- .4 Indoor sampling shall be completed between 900 mm and 1800 mm from the floor.
- .5 Results indicating that air quality testing has been completed and maximum chemical contaminant concentration requirements are required for each area tested.
 - .1 Testing must demonstrate chemical contaminants do not exceed the following concentrations:

Contaminant	Maximum Concentration
Particulate Matter	(PM10): 50 ug/m ³ (PM2.5): 15 ug/m ³
Formaldehyde	27 parts per billion
Total Volatile Organic Compounds	500 ug/m ³
Carbon Monoxide	9 PPM and no more than 2 PPM above outdoors

- .2 Testing must also demonstrate target chemicals do not exceed the following concentrations as listed in CDPH Standard Method v1.2, Table 4-1 (except formaldehyde):

Contaminant	Maximum Concentration (ug/m ³)
Acetaldehyde	70
Benzene	1.5
Carbon disulfide	400
Carbon tetrachloride	20
Chlorobenzene	500
Chloroform	150
Dichlorobenzene (1,4-)	400
Dichloroethylene (1,1)	35
Dimethylformamide (N,N-)	40
Dioxane (1,4-)	1500

Epichlorohydrin	1.5
Ethylbenzene	1000
Ethylene glycol	200
Ethylene glycol monoethyl ether	35
Ethylene glycol monoethyl ether acetate	150
Ethylene glycol monomethyl ether	30
Ethylene glycol monomethyl ether acetate	45
Hexane (n-)	3500
Isophorone	1000
Isopropanol	3500
Methyl chloroform	500
Methylene chloride	200
Methyl <i>t</i> -butyl ether	4000
Naphthalene	4.5
Phenol	100
Propylene glycol monomethyl ether	3500
Styrene	450
Tetrachloroethylene	17.5
Toluene	150
Trichloroethylene	300
Vinyl acetate	100
Xylenes, technical mixture (m-, o-, p-xylene combined)	350

- .3 In the event that passing results cannot be obtained for each of the IAQ tests it is the responsibility of the contractor to flush the failing area with temporary or permanent fans and arrange for re-testing prior to occupancy.
- .6 Copies of all testing results and reports must be submitted to the LEED Consultant upon testing completion but before occupancy.

END OF SECTION

IAQ 1 – LOW-EMITTING MATERIALS IDENTIFICATION
(Submit to the Consultant 14 days prior to ordering product/material)

Project Name:		Completed By:	
Project Location:		Company:	

Complete the following table for all applicable materials as per Section 01 81 19. This includes the following:

- Composite Wood on site and within the weather barrier including particle board, medium density fiberboard (both medium density & thin), hardwood plywood with veneer, composite or combination core, and wood structural panels or structural wood products, exclude products covered in flooring, ceiling, wall panels or furniture material category
- Carpet, carpet cushion, and all flooring materials

For the purposes of LEED® documentation, I certify the following information:

Product & Manufacturer	Cost	Surface Area	FloorScore Certified? (hard surface flooring)	Green Label Product? (carpet materials)	Certified CARB ultra-low-emitting formaldehyde (ULEF) or no added formaldehyde (NAF)? (composite wood)	Attached Supporting Documentation
						<input type="checkbox"/> MSDS <input type="checkbox"/> Product Data Sheet <input type="checkbox"/> Product Literature <input type="checkbox"/> Manufacturer Letter
						<input type="checkbox"/> MSDS <input type="checkbox"/> Product Data Sheet <input type="checkbox"/> Product Literature <input type="checkbox"/> Manufacturer Letter

I hereby certify that the information provided above is complete and correct:

_____	_____	_____
Signature of Authorized Official	Position	Date

Volatile Organic Compound (VOC): Organic chemicals that produce vapors at room temperature and atmospheric pressure (e.g. gasoline, solvents, etc). VOCs react with sunlight and nitrogen to form ground-level ozone, a chemical that has detrimental effects on human health and the environment.

Carpet and Rug Institute (CRI) Green Label: A program established by the national trade association representing the carpet and rug industry to identify carpet products that have been tested by an independent laboratory and have met the criteria for low VOC emissions. (www.carpet-rug.org)

Urea Formaldehyde: A combination of urea and formaldehyde that is used in some glues which readily decomposes at room temperature. Urea Formaldehyde is carcinogenic and an irritant to most people when present in high concentrations.

FloorScore Program: FloorScore program tests and certifies flooring products for compliance with indoor air quality emission requirements. Flooring products include vinyl, linoleum, laminate flooring, wood flooring, ceramic flooring, rubber flooring, wall base, and associated sundries.

IAQ 2: IAQ MANAGEMENT INSPECTION FORM

(Complete Weekly. Submit most recent copy to the Consultant on a monthly basis)

Project Name:		Completed By:	
Project Location:		Company:	

Date		IAQ Management Measures			Initials
		Currently Implemented	Deficiencies	Corrective Action Taken	
EX.	Sept 17/09	Dust curtain and HVAC pressurization protecting finished offices on 2 nd floor	Standing water present adjacent to sprinkler room in basement	Water removed. Adjacent materials were not damaged	G.L.

I hereby certify that the information provided above is complete and correct:

Part 1 General

1.1 GENERAL REQUIREMENTS

- .1 Read and conform to Division 01 requirements and documents referred to therein.

1.2 SUMMARY

- .1 Section Includes:
 - .1 General requirements relating to commissioning of Project's components and systems, specifying general requirements to PV of components, equipment, sub-systems, systems, and integrated systems.

1.3 REFERENCES

- .1 Acronyms:
 - .1 AFD - Alternate Forms of Delivery, service provider.
 - .2 BMM - Building Management Manual.
 - .3 Cx - Commissioning.
 - .4 EMCS - Energy Monitoring and Control Systems.
 - .5 IST – Integrated Systems Testing.
 - .6 O&M - Operation and Maintenance.
 - .7 PI - Product Information.
 - .8 PV - Performance Verification.
 - .9 TAB - Testing, Adjusting and Balancing.

1.4 GENERAL

- .1 Cx is a planned program of tests, procedures and checks carried out systematically on systems and integrated systems of the finished Project. Cx is performed after systems and integrated systems are completely installed, functional and Contractor's Performance Verification responsibilities have been completed and approved.
- .2 Objectives:
 - .1 Verify installed equipment, systems and integrated systems operate in accordance with Contract Documents and design criteria and intent.
 - .2 Ensure appropriate documentation is compiled into the BMM.
 - .3 Effectively train O&M staff.
- .3 Contractor assists in Cx process, operating equipment and systems, troubleshooting and making adjustments as required.
 - .1 Systems to be operated at full capacity under various modes to determine if they function correctly and consistently at peak efficiency. Systems to be interactively with each other as intended in accordance with Contract Documents and design criteria.

- .2 During these checks, adjustments to be made to enhance performance to meet environmental or user requirements.
- .4 Design Criteria: as per client's requirements or determined by design consultant. To meet Project functional and operational requirements.

1.5 COMMISSIONING OVERVIEW

- .1 Section 01 91 13.13 - Commissioning (CX) Plan.
- .2 For Cx responsibilities refer to Section 01 91 13.13 - Commissioning (CX) Plan.
- .3 Cx to be a line item of Contractor's cost breakdown.
- .4 Cx activities supplement field quality and testing procedures described in relevant technical Sections.
- .5 Cx is conducted in concert with activities performed during stage of Project delivery. Cx identifies issues in Planning and Design stages which are addressed during Construction and Cx stages to ensure the built facility is constructed and proven to operate satisfactorily under weather, environmental and occupancy conditions to meet functional and operational requirements. Cx activities includes transfer of critical knowledge to facility operational personnel.
- .6 Consultant will issue Interim Acceptance Certificate when:
 - .1 Completed Cx documentation has been received, reviewed for suitability and approved by Commissioning Authority.
 - .2 Equipment, components, systems, and integrated systems have been fully commissioned and function as per design intent to meet Project functional, operational requirements, and construction documents.
 - .3 Completion of O&M training session to operational and maintenance staff.
 - .4 Final O&M and Training Manual received, reviewed and approved by Commissioning Authority for suitability.
 - .5 Successful completion of integrated system tests, life safety support systems tests and after meeting all requirements of the authority having jurisdiction.

1.6 NON-CONFORMANCE TO PERFORMANCE VERIFICATION REQUIREMENTS

- .1 Should equipment, system components, and associated controls be incorrectly installed or malfunction during Cx, correct deficiencies, re-verify equipment and components within the unfunctional system, including related systems as deemed required by Commissioning Authority, to ensure effective performance.
- .2 Costs for corrective Work, additional tests, inspections, to determine acceptability and proper performance of such items to be borne by Contractor. Above costs to be in form of progress payment reductions or holdback assessments.

1.7 PRE-CX REVIEW

- .1 Before Construction:
 - .1 Review Contract documents, confirm by writing to Commissioning Authority.
 - .1 Adequacy of provisions for Cx.
 - .2 Aspects of design and installation pertinent to success of Cx.
- .2 During Construction:
 - .1 Co-ordinate provision, location and installation of provisions for Cx.
- .3 Before start of Cx:
 - .1 Have completed Cx Plan up-to-date.
 - .2 Ensure installation of related components, equipment, sub-systems, systems is complete.
 - .3 Fully understand Cx requirements and procedures.
 - .4 Have Cx documentation shelf-ready.
 - .5 Understand completely design criteria and intent and special features.
 - .6 Submit complete start-up documentation to Commissioning Authority.
 - .7 Have Cx schedules up-to-date.
 - .8 Ensure systems have been cleaned thoroughly.
 - .9 Complete TAB procedures on systems, submit TAB reports to Commissioning Authority for review and approval.
 - .10 Ensure "As-Built" system schematics are available.
- .4 Inform Commissioning Authority in writing of discrepancies and deficiencies on finished Works.

1.8 CONFLICTS

- .1 Report conflicts between requirements of this Section and other Sections to Commissioning Authority before start-up and obtain clarification.
- .2 Failure to report conflict and obtain clarification will result in application of most stringent requirement.

1.9 INFORMATION SUBMITTALS / ACTION SUBMITTALS

- .1 Submittals: in accordance with Section 01 33 00 - Submittal Procedures.
 - .1 Submit no later than 4 weeks after award of Contract:
 - .1 Draft Cx documentation.
 - .2 Preliminary Cx schedule.
 - .2 Request in writing to Commissioning Authority for changes to submittals and obtain written approval at least 8 weeks prior to start of Cx.
 - .3 Submit proposed Cx procedures to Commissioning Authority where not specified and obtain written approval at least 8 weeks prior to start of Cx.

- .4 Provide additional documentation relating to Cx process required by Commissioning Authority.

1.10 COMMISSIONING DOCUMENTATION

- .1 Commissioning Authority to review and approve Cx documentation.
- .2 Provide completed and approved Cx documentation to Commissioning Authority.

1.11 COMMISSIONING SCHEDULE

- .1 Provide detailed Cx schedule as part of construction schedule in accordance with Construction Schedule.
- .2 Provide adequate time for Cx activities prescribed in technical Sections and commissioning Sections including:
 - .1 Approval of Cx reports.
 - .2 Verification of reported results.
 - .3 Repairs, retesting, re-commissioning, re-verification.
 - .4 Training.

1.12 COMMISSIONING MEETINGS

- .1 Convene Cx meetings following Project meetings and as specified herein.
- .2 Purpose: to resolve issues, monitor progress, identify deficiencies, relating to Cx.
- .3 Continue Cx meetings on regular basis until commissioning deliverables have been addressed.
- .4 At 60% construction completion stage. Commissioning Authority to call a separate Cx scope meeting to review progress, discuss schedule of equipment start-up activities and prepare for Cx. Issues at meeting to include:
 - .1 Review duties and responsibilities of Contractor and Subcontractors, addressing delays and potential problems.
 - .2 Determine the degree of involvement of trades and manufacturer's representatives in the commissioning process.
- .5 Thereafter Cx meetings to be held until Project completion and as required during equipment start-up and functional testing period.
- .6 Meeting will be chaired by Contractor, who will record and distribute minutes.
- .7 Ensure Subcontractors and relevant manufacturer representatives are present at 60% and subsequent Cx meetings and as required.

1.13 STARTING AND TESTING

- .1 Contractor assumes liabilities and costs for inspections. Including disassembly and re-assembly after approval, starting, testing and adjusting, including supply of testing equipment.

1.14 WITNESSING OF STARTING AND TESTING

- .1 Provide 14 days notice to the Commissioning Authority and Owner prior to commencement of start-up and testing work.
- .2 Commissioning Authority and Owner's representative to witness of start-up and testing.
- .3 Commissioning Authority to be present at tests performed and documented by sub-trades, Suppliers and equipment manufacturers.

1.15 MANUFACTURER'S INVOLVEMENT

- .1 Factory testing: manufacturer to:
 - .1 Coordinate time and location of testing.
 - .2 Provide testing documentation for approval by Commissioning Authority.
 - .3 Arrange for Commissioning Authority to witness tests.
 - .4 Obtain written approval of test results and documentation from Commissioning Authority before delivery to site.
- .2 Obtain manufacturers installation, start-up and operations instructions prior to start-up of components, equipment and systems and review with Commissioning Authority.
 - .1 Compare completed installation with manufacturer's published data, record discrepancies, and review with manufacturer.
 - .2 Modify procedures detrimental to equipment performance and review same with manufacturer before start-up.
- .3 Integrity of warranties:
 - .1 Use manufacturer's trained start-up personnel where specified elsewhere in other divisions or required to maintain integrity of warranty.
 - .2 Verify with manufacturer that testing as specified will not void warranties.
- .4 Qualifications of manufacturer's personnel:
 - .1 Experienced in design, installation and operation of equipment and systems.
 - .2 Ability to interpret test results accurately.
 - .3 To report results in clear, concise, logical manner.

1.16 PROCEDURES

- .1 Verify that equipment and systems are complete, clean, and operating in normal and safe manner prior to conducting start-up, testing and Cx.

- .2 Conduct start-up and testing in following distinct phases:
 - .1 Included in delivery and installation:
 - .1 Verification of conformity to Specification, approved Shop Drawings and completion of PI report forms.
 - .2 Visual inspection of quality of installation.
 - .2 Start-up: follow accepted start-up procedures.
 - .3 Operational testing: document equipment performance.
 - .4 System PV: include repetition of tests after correcting deficiencies.
 - .5 Post-substantial performance verification: to include fine-tuning.
- .3 Correct deficiencies and obtain approval from Commissioning Authority after distinct phases have been completed and before commencing next phase.
- .4 Document require tests on approved PV forms.
- .5 Failure to follow accepted start-up procedures will result in re-evaluation of equipment by an independent testing agency selected by Commissioning Authority. If results reveal that equipment start-up was not in accordance with requirements, and resulted in damage to equipment, implement following:
 - .1 Minor equipment/systems: implement corrective measures approved by Commissioning Authority.
 - .2 Major equipment/systems: if evaluation report concludes that damage is minor, implement corrective measures approved by Commissioning Authority.
 - .3 If evaluation report concludes that major damage has occurred, Commissioning Authority shall reject equipment.
 - .1 Rejected equipment to be remove from site and replace with new.
 - .2 Subject new equipment/systems to specified start-up procedures.

1.17 START-UP DOCUMENTATION

- .1 Assemble start-up documentation and submit to Commissioning Authority for approval before commencement of commissioning.
- .2 Start-up documentation to include:
 - .1 Factory and on-site test certificates for specified equipment.
 - .2 Pre-start-up inspection reports.
 - .3 Signed installation/start-up check lists.
 - .4 Start-up reports,
 - .5 Step-by-step description of complete start-up procedures, to permit Commissioning Authority to repeat start-up at any time.

1.18 OPERATION AND MAINTENANCE OF EQUIPMENT AND SYSTEMS

- .1 After start-up, operate and maintain equipment and systems as directed by equipment/system manufacturer.

- .2 With assistance of manufacturer develop written maintenance program and submit to Commissioning Authority for approval before implementation.
- .3 Operate and maintain systems for length of time required for commissioning to be completed.
- .4 After completion of commissioning, operate and maintain systems until issuance of certificate of interim acceptance.
- .5 The Contractor shall prepare and submit a comprehensive O&M Manual that integrates the Environmental Compliance Approval (ECA) requirements with Stormwater Management Pond operations, in consultation with the Consultant.

1.19 TEST RESULTS

- .1 If start-up, testing and/or PV produce unacceptable results, repair, replace or repeat specified starting and/or PV procedures until acceptable results are achieved.
- .2 Provide manpower and materials, assume costs for re-commissioning.

1.20 START OF COMMISSIONING

- .1 Notify Commissioning Authority at least 21 Days prior to start of Cx.
- .2 Start Cx after elements of building affecting start-up and performance verification of systems have been completed.

1.21 INSTRUMENTS / EQUIPMENT

- .1 Submit to Commissioning Authority for review and approval:
 - .1 Complete list of instruments proposed to be used.
 - .2 Listed data including, serial number, current calibration certificate, calibration date, calibration expiry date and calibration accuracy.
- .2 Provide the following equipment as required:
 - .1 2-way radios.
 - .2 Ladders.
 - .3 Equipment as required to complete Work.

1.22 COMMISSIONING PERFORMANCE VERIFICATION

- .1 Carry out Cx:
 - .1 Under actual operating conditions, over entire operating range, in all modes.
 - .2 On independent systems and interacting systems.
- .2 Cx procedures to be repeatable and reported results are to be verifiable.
- .3 Follow equipment manufacturer's operating instructions.

- .4 EMCS trending to be available as supporting documentation for performance verification.

1.23 WITNESSING COMMISSIONING

- .1 Commissioning Authority and Owner's Representative to witness activities and verify results.

1.24 AUTHORITIES HAVING JURISDICTION

- .1 Where specified start-up, testing or commissioning procedures duplicate verification requirements of authority having jurisdiction, arrange for authority to witness procedures so as to avoid duplication of tests and to facilitate expedient acceptance of facility.
- .2 Obtain certificates of approval, acceptance and compliance with rules and regulation of authority having jurisdiction.
- .3 Provide copies to Commissioning Authority within 5 days of test and with Cx report.

1.25 COMMISSIONING CONSTRAINTS

- .1 Since access into secure or sensitive areas will be very difficult after occupancy it is necessary to complete Cx of occupancy, weather, and seasonal sensitive equipment and systems in these areas before issuance of the Interim Certificate, using, if necessary, simulated thermal loads.

1.26 EXTRAPOLATION OF RESULTS

- .1 Weather or seasonally sensitive commissioning shall occur during the appropriate season, even if after substantial completion. Where commissioning cannot be conducted under near-rated or near-design conditions, extrapolation of part-load results to design conditions may be permitted when approved by the Commissioning Authority, using manufacturer's data and methods.

1.27 EXTENT OF VERIFICATION

- .1 Laboratory areas:
 - .1 Provide manpower and instrumentation to verify up to 100% of reported results.
- .2 Elsewhere:
 - .1 Provide manpower and instrumentation to verify up to 30% of reported results, unless specified otherwise in other Sections.
- .3 Number and location to be at discretion of Commissioning Authority.
- .4 Conduct tests repeated during verification under same conditions as original tests, using same test equipment, instrumentation.

- .5 Review and repeat commissioning of systems if inconsistencies found in more than 20% of reported results.
- .6 Perform additional commissioning until results are acceptable to Commissioning Authority.

1.28 REPEAT VERIFICATIONS

- .1 Assume costs incurred by Commissioning Authority for third and subsequent verifications where:
 - .1 Verification of reported results fail to receive Commissioning Authority approval.
 - .2 Repetition of second verification again fails to receive approval.
 - .3 Commissioning Authority deems Contractor's request for second verification was premature.

1.29 SUNDRY CHECKS AND ADJUSTMENTS

- .1 Make adjustments and changes which become apparent as Cx proceeds.
- .2 Perform static and operational checks as applicable and as required.

1.30 DEFICIENCIES, FAULTS, DEFECTS

- .1 Correct deficiencies found during start-up and Cx to satisfaction of Commissioning Authority.
- .2 Report problems, faults or defects affecting Cx to Commissioning Authority in writing. Stop Cx until problems are rectified. Proceed with written approval from Commissioning Authority.

1.31 COMPLETION OF COMMISSIONING

- .1 Upon completion of Cx leave systems in normal operating mode.
- .2 Except for warranty and seasonal verification activities specified in Cx Specifications, complete Cx prior to issuance of Interim Certificate of Completion.
- .3 Cx to be considered complete when Contract Cx deliverables have been submitted and accepted by Commissioning Authority.

1.32 ACTIVITIES UPON COMPLETION OF COMMISSIONING

- .1 When changes are made to baseline components or system settings established during Cx process, provide updated Cx form for affected item.

1.33 TRAINING

- .1 In accordance with Section 01 79 00 – Demonstration and Training.

1.34 MAINTENANCE MATERIALS, SPARE PARTS, SPECIAL TOOLS

- .1 Supply, deliver, and document maintenance materials, spare parts, and special tools as specified in Contract.

1.35 OCCUPANCY

- .1 Cooperate fully with Commissioning Authority during stages of acceptance and occupancy of facility.

1.36 INSTALLED INSTRUMENTATION

- .1 Use instruments installed under Contract for TAB and PV if:
 - .1 Accuracy complies with these Specifications.
 - .2 Calibration certificates have been deposited with Commissioning Authority.
- .2 Calibrated EMCS sensors may be used to obtain performance data provided that sensor calibration has been completed and accepted.

1.37 PERFORMANCE VERIFICATION TOLERANCES

- .1 Application tolerances:
 - .1 Specified range of acceptable deviations of measured values from specified values or specified design criteria. Except for special areas, to be within +/- 10% of specified values.
- .2 Instrument accuracy tolerances:
 - .1 To be of higher order of magnitude than equipment or system being tested.
- .3 Measurement tolerances during verification:
 - .1 Unless otherwise specified actual values to be within +/- 2% of recorded values.

1.38 OWNER'S PERFORMANCE TESTING

- .1 Performance testing of equipment or system by Commissioning Authority will not relieve Contractor from compliance with specified start-up and testing procedures.

Part 2 Products

Part 3 Execution

3.1 NOT USED

END OF SECTION

Part 1 General

1.1 SUMMARY

.1 Section Includes:

- .1 Description of overall structure of Cx Plan and roles and responsibilities of Cx team.

1.2 REFERENCES

.1 Acronyms:

- .1 Cx - Commissioning.
- .2 BMM - Building Management Manual.
- .3 EMCS - Energy Monitoring and Control Systems.
- .4 MSDS - Material Safety Data Sheets.
- .5 PI - Product Information.
- .6 PV - Performance Verification.
- .7 TAB - Testing, Adjusting and Balancing.
- .8 WHMIS - Workplace Hazardous Materials Information System.

.2 Definitions:

- .1 Bumping: short term start-up to prove ability to start and prove correct rotation.
- .2 Deferred Cx - Cx activities delayed for reasons beyond Contractor's control due to lack of occupancy, weather conditions, need for heating/cooling loads.
- .3 Term "Cx" in this section means "Commissioning".

.3 Reference Standards:

- .1 American Water Works Association (AWWA).
- .2 The American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE):
 - .1 ASHRAE 202-2018, Standard 202 -2018 -- Commissioning Process for Buildings and Systems (ANSI Approved; IES Co-sponsored).
- .3 Canadian Standards Association (CSA Group):
 - .1 CSA Z320-11 (R2021), Building Commissioning, Includes Update No. 1(2011).
- .4 National Fire Protection Association (NFPA):
 - .1 NFPA (Fire) 13, Standard for the Installation of Sprinkler Systems, 2022 Edition.
 - .2 NFPA (Fire) 14, Standard for the installation of Standpipe and hose Systems, 2019 Edition
 - .3 NFPA (Fire) 20, Installation of Stationary Pumps for Fire Protection, 2022 Edition.
- .5 Underwriters' Laboratories of Canada (ULC):

- .1 ULC 1001-11, Standard for Integrated Systems Testing of Fire Protection and Life Safety Systems (CAN/ULC S1001-11).

1.3 GENERAL

- .1 Provide a fully functional facility.
 - .1 Systems, equipment and components meet user's functional requirements before date of acceptance, and operate consistently at peak efficiencies and within specified energy budgets under normal loads.
 - .2 Facility user and O&M personnel have been fully trained in aspects of installed systems.
 - .3 Optimized life cycle costs.
 - .4 Complete documentation relating to installed equipment and systems.
- .2 Use this Cx Plan as master planning document for Cx:
 - .1 Outlines organization, scheduling, allocation of resources, documentation, pertaining to implementation of Cx.
 - .2 Communicates responsibilities of team members involved in Cx Scheduling, documentation requirements, and verification procedures.
 - .3 Sets out deliverables relating to O&M, process and administration of Cx.
 - .4 Describes process of verification of how built Works meet Owner/Investor's requirements.
 - .5 Produces a complete functional system prior to issuance of Certificate of Occupancy.
 - .6 Management tool that sets out scope, standards, roles and responsibilities, expectations, deliverables, and provides:
 - .1 Overview of Cx.
 - .2 General description of elements that make up Cx Plan.
 - .3 Process and methodology for successful Cx.

1.4 DEVELOPMENT OF 100% CX PLAN

- .1 Cx Plan to be 100% completed within 8 weeks of award of Contract to take into account:
 - .1 Approved Shop Drawings and product data.
 - .2 Approved changes to Contract.
 - .3 Contractor's Project schedule.
 - .4 Cx schedule.
 - .5 Contractor's, Sub-Contractor's, Suppliers' requirements.
 - .6 Project construction team's and Cx team's requirements.
- .2 Submit completed Cx Plan to Owner and Consultant and obtain written approval.

1.5 REFINEMENT OF CX PLAN

- .1 During construction phase, revise, refine and update Cx Plan to include:
 - .1 Changes resulting from Client program modifications.
 - .2 Approved design and construction changes.

- .2 Revise, refine and update every 6 months during construction phase. At each revision, indicate revision number and date.
- .3 Submit each revised Cx Plan to Owner and Consultant for review and obtain written approval.
- .4 Include testing parameters at full range of operating conditions and check responses of equipment and systems.

1.6 COMPOSITION, ROLES AND RESPONSIBILITIES OF CX TEAM

- .1 Cx Team consists of following members:
 - .1 Owner's Commissioning Authority is responsible for:
 - .1 Ensuring Cx activities are carried out to ensure delivery of a fully operational Project including:
 - .1 Review of Cx documentation from operational perspective.
 - .2 Review for performance, reliability, durability of operation, accessibility, maintainability, operational efficiency under conditions of operation.
 - .3 Protection of health, safety and comfort of occupants and O&M personnel.
 - .4 Monitoring of Cx activities, training, development of Cx documentation.
 - .5 Work closely with members of Cx Team.
 - .6 Organizing Cx.
 - .7 Monitoring operations Cx activities.
 - .8 Witnessing, certifying accuracy of reported results.
 - .9 Witnessing and certifying TAB and other tests.
 - .10 Developing BMM.
 - .11 Ensuring implementation of final Cx Plan.
 - .12 Performing verification of performance of installed systems and equipment.
 - .13 Implementation of Training Plan.
 - .2 Implementing specified Cx activities in coordination with the Contractor including:
 - .1 Demonstrations.
 - .2 Training.
 - .3 Testing.
 - .4 Preparation, submission of test reports.
 - .2 Consultant is responsible for:
 - .1 Reviewing the Cx plan and demonstration scripts are in accordance with design expectations.
 - .2 Conducting periodic site reviews to observe general progress during construction.

- .3 Construction Team: Contractor, Sub-Contractors, Suppliers and support disciplines, is responsible for construction/installation in accordance with Contract Documents, including:
 - .1 Assigning one person as point of contact with Owner, Consultant and Cx Manager for administrative and coordination purposes.
- .4 Property Manager: represents lead role in Operation Phase and onwards and is responsible for:
 - .1 Receiving facility.
 - .2 Day-To-Day operation and maintenance of facility.

1.7 CX PARTICIPANTS

- .1 Employ the following Cx participants to verify performance of equipment and systems:
 - .1 Installation Contractor/Subcontractor:
 - .1 Equipment and systems except as noted.
 - .2 Equipment manufacturer: equipment specified to be installed and started by manufacturer.
 - .1 To include performance verification.
 - .3 Specialist Subcontractor: equipment and systems supplied and installed by specialist Subcontractor.
 - .4 Specialist Cx agency:
 - .1 Possessing specialist qualifications and installations providing environments essential to client's program but are outside scope or expertise of Cx specialists on this Project.
 - .5 Client: responsible for intrusion and access security systems.
 - .6 Ensure that Cx participant:
 - .1 Could complete Work within scheduled time frame.
 - .2 Available for emergency and troubleshooting service during first year of occupancy by user for adjustments and modifications outside responsibility of O&M personnel, including:
 - .1 Modify ventilation rates to meet changes in off-gassing.
 - .2 Changes to heating or cooling loads beyond scope of EMCS.
 - .3 Changes to EMCS control strategies beyond level of training provided to O&M personnel.
 - .4 Redistribution of electrical services.
 - .5 Modifications of fire alarm systems.
 - .6 Modifications to voice communications systems.
 - .7 Provide names of participants to Commissioning Authority and details of instruments and procedures to be followed for Cx 3 months prior to starting date of Cx for review and approval.

1.8 EXTENT OF CX

- .1 Cx Structural and Architectural Systems:
 - .1 Architectural and structural:
 - .1 Beam and slab deflection:
 - .1 Refer to Section G – Structural Movements/S005 & Table 1/S005 of Entuitive's structural drawings.
 - .2 Exterior systems:
 - .1 Refer to Section G – Structural Movements/S005 & Table 1/S005 of Entuitive's structural drawings.
 - .3 Doors, windows, related hardware:
 - .1 Door and window hardware.
 - .2 Commission mechanical systems and associated equipment:
 - .1 Plumbing systems:
 - .1 Domestic CWS and HWS.
 - .2 Regular sanitary waste systems.
 - .3 Sewage pumps.
 - .4 Storm water systems.
 - .5 Sump pumps.
 - .2 HVAC and exhaust systems:
 - .1 HVAC systems.
 - .2 General exhaust systems.
 - .3 Exhaust systems and related systems
 - .4 Heat recovery systems
 - .3 Fire and life safety systems:
 - .1 Fire extinguishers.
 - .2 Integrated Systems Testing (IST) of fire protection and life safety systems.
 - .4 Noise and vibration control systems for mechanical systems.
 - .5 Seismic restraint and control measures.
 - .1 Refer to Section B – Lateral Load Restraining System/S005 of Entuitive's structural drawings.
 - .6 IAQ environmental control systems:
 - .1 Indoor conditions
 - .2 Indoor air quality (IAQ)
 - .3 Environmental control systems
 - .7 EMCS:
 - .1 Energy metering systems.
 - .3 Commission electrical systems and equipment:
 - .1 High voltage:
 - .1 High voltage switch gear and transformation equipment.
 - .2 High voltage distribution systems.

- .2 Low voltage below 750 V:
 - .1 Low voltage equipment.
 - .2 Low voltage distribution systems.
 - .3 Voice communications systems.
 - .4 Audio/visual systems.
 - .5 Electronic data and communications information systems.
- .3 Emergency power generation systems:
 - .1 Generators.
 - .2 Fuel systems.
 - .3 Transfer switchgear and controllers.
- .4 Lighting systems:
 - .1 Lighting equipment.
 - .2 Distribution systems.
 - .3 Emergency lighting systems, including battery packs.
 - .4 Fire exit emergency signage.
- .5 Other systems and equipment:
 - .1 Intrusion and access security and safety systems.

1.9 DELIVERABLES RELATING TO O&M PERSPECTIVES

- .1 General requirements:
 - .1 Compile English and French documentation.
 - .2 Documentation to be computer-compatible format ready for inputting for data management.
- .2 Provide deliverables:
 - .1 Warranties.
 - .2 Project record documentation.
 - .3 Inventory of spare parts, special tools and maintenance materials.
 - .4 Maintenance Management System (MMS) identification system used.
 - .5 WHMIS information.
 - .6 MSDS data sheets.
 - .7 Electrical Panel inventory containing detailed inventory of electrical circuitry for each panel board. Duplicate of inventory inside each panel.

1.10 DELIVERABLES RELATING TO THE CX PROCESS

- .1 General:
 - .1 Start-up, testing and Cx requirements, conditions for acceptance and Specifications form part of relevant technical sections of these Specifications.
- .2 Definitions:
 - .1 Cx as used in this Section includes:
 - .1 Cx of components, equipment, systems, subsystems, and integrated systems.

- .2 Factory inspections and performance verification tests.
- .3 Deliverables: Commissioning Authority provides:
 - .1 Cx Specifications.
 - .2 Startup, pre-Cx activities and documentation for systems, and equipment.
 - .3 Completed installation checklists (ICL).
 - .4 Completed product information (PI) report forms.
 - .5 Completed performance verification (PV) report forms.
 - .6 Results of Performance Verification Tests and Inspections.
 - .7 Description of Cx activities and documentation.
 - .8 Description of Cx of integrated systems and documentation.
 - .9 Training Plans.
 - .10 Cx Reports.
 - .11 Prescribed activities during warranty period.

1.11 PRE-CX ACTIVITIES AND RELATED DOCUMENTATION

- .1 Items listed in this Cx Plan include the following:
 - .1 Pre-Start-Up inspections: by Commissioning Authority prior to permission to start up and rectification of deficiencies to Consultant's satisfaction.
 - .2 Contractor to use approved check lists.
 - .3 Commissioning Authority will monitor some of these pre-start-up inspections.
 - .4 Include completed documentation with Cx report.
 - .5 Conduct pre-start-up tests: conduct pressure, static, flushing, cleaning, and "bumping" during construction as specified in technical sections. To be witnessed and certified by Commissioning Authority and does not form part of Cx Specifications.
 - .6 Consultant may monitor some of these inspections and tests.
 - .7 Include completed documentation in Cx report.
- .2 Pre-Cx activities - ARCHITECTURAL AND STRUCTURAL:
 - .1 Slab and beam deflection test: test after removal of temporary supports and concrete has cured to ensure adequacy for raised floors.
 - .2 Exterior walls: conduct thermographic surveys to ensure appropriate level of tightness after exterior envelope has been completed. Permanent HVAC systems are able to provide appropriate negative or positive pressure, a temperature of at 20 degrees C can be maintained between inside and outside and wind speed is less than 10 kph.
 - .3 Doors, windows, related hardware:
 - .1 Overhead doors
 - .2 Door and window hardware
- .3 Pre-Cx activities - MECHANICAL:
 - .1 Plumbing systems:
 - .1 "Bump" each item of equipment in its "stand-alone" mode.

- .2 Complete pre-start-up checks and complete relevant documentation.
 - .3 After equipment has been started, test related systems in conjunction with control systems on a system-by-system basis.
- .2 HVAC equipment and systems:
 - .1 "Bump" each item of equipment in its "stand-alone" mode.
 - .2 At this time, complete pre-start-up checks and complete relevant documentation.
 - .3 After equipment has been started, test related systems in conjunction with control systems on a system-by-system basis.
 - .4 Perform TAB on systems. TAB reports to be approved by Commissioning Authority and Consultant.
- .3 EMCS:
 - .1 EMCS trending to be available as supporting documentation for performance verification.
 - .2 Perform point-by-point testing in parallel with start-up.
 - .3 Carry out point-by-point verification.
 - .4 Demonstrate performance of systems, to be witnessed by Commissioning Authority prior to start of 30 day Final Acceptance Test period.
 - .5 Perform final Cx and operational tests during demonstration period and 30 day test period.
 - .6 Only additional testing after foregoing have been successfully completed to be "Off-Season Tests".
- .4 Pre-Cx activities - LIFE SAFETY SYSTEMS
 - .1 Include equipment and systems identified above.
 - .2 Reports of test results to be witnessed and certified by Commissioning Authority before submission to Consultant; retest in presence of Consultant when requested.
- .5 Pre-Cx activities - ELECTRICAL:
 - .1 High voltage distribution systems over 750 V:
 - .2 Low voltage distribution systems under 750 V:
 - .1 Requires independent testing agency to perform pre- energization and post-energization tests.
 - .3 Emergency power generation systems
 - .1 Transfer switches: test by simulating loss of power. Verify availability of power at equipment requiring same.
 - .4 Lighting systems:
 - .1 Emergency lighting systems:
 - .1 Tests to include verification of lighting levels and coverage, initially by disrupting normal power.
 - .5 Low voltage systems: these include:
 - .1 Communications, low voltage lighting control systems and data communications systems.

- .6 Security, surveillance and intrusion alarm systems

1.12 START-UP

- .1 Start up components, equipment and systems.
- .2 Equipment manufacturer, Supplier, installing specialist Sub-Contractor, as appropriate, to start-up, under Contractor's direction, following equipment, systems:
- .3 Commissioning Authority to monitor some of these start-up activities.
 - .1 Rectify start-up deficiencies to satisfaction of Commissioning Authority.
- .4 Performance Verification (PV):
 - .1 Contractor to perform.
 - .1 Repeat when necessary until results are acceptable to Consultant Commissioning Authority.
 - .2 Use procedures modified generic procedures to suit Project requirements.
 - .3 Commissioning Authority to witness and certify reported results using approved PI and PV forms.
 - .4 Commissioning Authority to approve completed PV reports and provide to Owner.
 - .5 Consultant reserves right to verify up to 30% of reported results at random.
 - .6 Failure of randomly selected item shall result in rejection of PV report or report of system startup and testing.

1.13 CX ACTIVITIES AND RELATED DOCUMENTATION

- .1 Perform Cx by specified Commissioning Authority using procedures developed by Commissioning Authority and approved by Owner.
- .2 Commissioning Authority to monitor Cx activities.
- .3 Upon satisfactory completion, Cx agency performing tests to prepare Cx Report using approved PV forms.
- .4 Commissioning Authority to witness, certify reported results of, Cx activities and forward to Owner.
- .5 Consultant reserves right to verify a percentage of reported results at no cost to Contract.

1.14 CX OF INTEGRATED SYSTEMS AND RELATED DOCUMENTATION

- .1 Cx of integrated systems shall be implemented to bring systems from a state of individual substantial completion to full dynamic operation. During the testing process, unexpected, conflicting and incorrect system operations shall be identified, recorded and corrected. The completion of testing shall result in expected and reliable functioning of all complementary systems, in all modes and demand loading.

- .2 Cx to be performed by specified Commissioning Authority using procedures developed by Commissioning Authority and approved by Owner.
- .3 Tests to be witnessed by Commissioning Authority and documented on approved report forms.
- .4 Upon satisfactory completion Contractor to prepare Cx Report, to be certified by Commissioning Authority and submitted to Owner for review.
- .5 Owner reserves right to verify percentage of reported results.
- .6 Identification:
 - .1 In later stages of Cx, before hand-over and acceptance Commissioning Authority, Contractor, and Project Manager to co-operate to complete inventory data sheets and provide assistance to Owner in full implementation of MMS identification system of components, equipment, sub-systems, systems.

1.15 INSTALLATION CHECK LISTS (ICL)

- .1 Refer to Section 01 91 13.16 - Commissioning Forms: Installation Check Lists and Product Information (PI) / Performance Verification (PV) Forms.

1.16 PRODUCT INFORMATION (PI) REPORT FORMS

- .1 Refer to Section 01 91 13.16 - Commissioning Forms: Installation Check Lists and Product Information (PI) / Performance Verification (PV) Forms.

1.17 PERFORMANCE VERIFICATION (PV) REPORT

- .1 Refer to Section 01 91 13.16 - Commissioning Forms: Installation Check Lists and Product Information (PI) / Performance Verification (PV) Forms.

1.18 DELIVERABLES RELATING TO ADMINISTRATION OF CX

- .1 General:
 - .1 Because of risk assessment, Commissioning Authority shall complete Cx of occupancy, weather and seasonal-sensitive equipment and systems in these areas before building is occupied.

1.19 CX SCHEDULES

- .1 Commissioning Authority shall prepare detailed critical path Cx Schedule and submit to Owner for review and approval same time as Project Construction Schedule. Include:
 - .1 Milestones, testing, documentation, training and Cx activities of components, equipment, subsystems, systems and integrated systems, including:
 - .1 Design criteria, design intents.
 - .2 Pre-TAB review: 28 days after Contract award, and before construction starts.

- .3 Commissioning Authority's credentials: 60 days before start of Cx.
- .4 Cx procedures: 3 months after award of Contract.
- .5 Cx Report format: 3 months after Contract award.
- .6 Discussion of heating/cooling loads for Cx: 3 months before start-up.
- .7 Submission of list of instrumentation with relevant certificates: 21 days before start of Cx.
- .8 Notification of intention to start TAB: 21 days before start of TAB.
- .9 TAB: after successful start-up, correction of deficiencies and verification of normal and safe operation.
- .10 Notification of intention to start Cx: 14 days before start of Cx.
- .11 Notification of intention to start Cx of integrated systems: after Cx of related systems is completed 14 days before start of integrated system Cx.
- .12 Identification of deferred Cx.
- .13 Implementation of training plans.
- .14 Cx of smoke management/control systems: after Cx of related systems is completed and 7 days before proposed date of Cx these systems.
- .15 Cx reports: immediately upon successful completion of Cx.
- .16 Emergency evacuation exercises: after 80% occupancy.
- .2 Detailed training schedule to demonstrate no conflicts with testing, completion of Project and hand-over to Property Manager.
- .3 6 months in Cx schedule for verification of performance in all seasons and wear conditions.
- .2 After approval, incorporate Cx Schedule into Construction Schedule.
- .3 Contractor, Commissioning Authority, and Owner will monitor progress of Cx against this schedule.

1.20 CX REPORTS

- .1 Commissioning Authority shall submit reports of tests, witnessed and certified by Commissioning Authority.
- .2 Include completed and certified PV reports in properly formatted Cx Reports.
- .3 Before reports are accepted, reported results may be subject to verification by Consultant.

1.21 ACTIVITIES DURING WARRANTY PERIOD

- .1 Cx activities must be completed before issuance of Interim Certificate, it is anticipated that certain Cx activities may be necessary during Warranty Period, including:
 - .1 Fine tuning of HVAC systems.

- .2 Adjustment of ventilation rates to promote good indoor air quality and reduce deleterious effects of VOCs generated by off-gassing from construction materials and furnishings.
- .3 Full-scale emergency evacuation exercises.

1.22 TESTS TO BE PERFORMED BY OWNER/USER

- .1 None is anticipated on this Project.

1.23 TRAINING PLANS

- .1 Refer to Section 01 79 00 – Demonstration and Training.

1.24 FINAL SETTINGS

- .1 Upon completion of Cx to satisfaction of Owner lock control devices in their final positions, indelibly mark settings marked and include in Cx Reports.

Part 2 Products

2.1 NOT USED

Part 3 Execution

3.1 RESOLUTION LOG

- .1 Provide resolution log in accordance with CSA Z320.

Overview

Purpose of this Commissioning Plan

This Commissioning Plan is meant to be additional instructions to the Commissioning Plan included in as part of the contract documents/specifications. Any conflicting instructions between the documents, the original contract documents/specifications shall preside. This Commissioning Plan is to be used as a Commissioning planning, management and communications tool. It sets out scope, standards, roles and responsibilities, expectations, and deliverables. It provides an overview of commissioning, and sets out the process and the methodology for successful commissioning of the project. The Commissioning Plan provides direction for the commissioning process during construction, particularly providing resolution for issues and providing details that cannot be, or were not, fully developed during design, such as scheduling, participation of various parties of this particular project, actual lines of reporting and approvals, coordination, etc.

This plan does not provide a detailed explanation of required testing procedures. The detailed testing requirements and procedures are found in the Specifications and any applicable Codes or Standards. Additional details regarding functional and Pre-Functional testing will be developed during construction when start-up sequencing is better understood.

Commissioning Scope

GCMYs scope according to the Owner's contract commences during the construction phase of this project will involve the completion of a number of activities, mainly by the equipment suppliers and installing contractors and coordinated by the Commissioning Authority.

According to the Contract Documents:

- Preparation and submission of a commissioning plan, including, pre-functional check sheets and functional check sheets for each system to be commissioned
- During construction, inspect the site and be familiar with project particulars
- Coordinate and participate in the execution of pre-functional and functional checks and tests.
- Witness and ensure Owner's staff have been trained to use and troubleshoot each system included in the project.
- Verify completeness of the O&M manuals.
- Inspect site to assess the operation of the system approximately 8 to 10 months after substantial completion

- Compile final commissioning report to indicate whether systems, subsystems, and equipment have been properly installed according to the contract documents.

Abbreviations and Definitions

The following are common abbreviations used in this document.

A/E	Architect and Design Engineers
CA	Commissioning Authority
CC	Controls Contractor
FM	Facility Manager/Service Provider
FT	Functional Performance Test
GC	General Contractor
MC	Mechanical Contractor
PC	Pre-functional Test sheet
PM	Project Manager
SUBS	Subcontractors to General
TAB	Test and Balance Contractor
CX	Commissioning
CX PLAN	Commissioning Plan document
EC	Electrical Contractor

Systems to be Commissioned

The following marked systems will be commissioned in this project.

HVAC Systems

X	Energy Recovery Ventilators
X	Heat Exchangers
X	In-Slab Radiant Heating (Floor and Snow Melt)
X	VAVs
X	FCUs/CUs/SB (Branch Selector)
X	VRF Heat Pumps
X	Unheated Air Curtains
X	Ceiling Fans (Big Ass Fans)
X	Unit Heaters
X	Entrance Heaters
X	DHWH
X	Pumps
X	Humidifier
X	Piping, cleaning and flushing
X	Duct pressure testing

X	Testing, Adjusting and Balancing work
X	Temperature, Humidity and CO2 sensors
X	HVAC Controls
X	Air Flushing

Electrical Systems

X	Lighting controls
X	Dimming controls
X	Emergency Lighting
X	Exit Signs
X	Main Switchgear
X	Electrical Panels
X	Meters
X	150kW Outdoor Generator
X	ATS's
X	Roll-up Doors

Plumbing

X	Faucets, water closets, urinals, shower fixtures
X	Floor Drains
X	Domestic Water Pump Operation
X	Domestic Hot Water Heater
X	Domestic Hot Water Tanks
X	Sump Pumps and Control

Building Envelope

X	Wall Assembly
X	Air/Vapour Barrier
X	Roofing
X	Thermal Scans (Positive & Negative Pressure)
X	Passive House Pressure Tests (Positive and Negative)

General Building Information

Project	York Region North Roads Operations Centre
Owner	The Regional Municipality of York
Building Name	YRNROC
Address	3252 Baseline Road, Sutton West, ON
Building Type	Office and Garage Expansion
Approximate ft²	Office – 697 m ² Garage – 1,081 m ²
Construction Period	Spring 2025 – Early 2027

Commissioning Team Members

Owner	Name & Title	Fang Li, Sr. Project Manager, Property Services Branch	Cell #	905-215-2629

Roles and Responsibilities

Location of Role Descriptions

Descriptions and explanations of the roles and responsibilities of those in the commissioning process are found in the following places in the Contract Documents.

LIST OF TEAM MEMBERS	Cx Plan
MANAGEMENT PLAN OUTLINE	Cx Plan
GENERAL ROLES	Cx Plan

SPECIFIC RESPONSIBILITIES

Information For All Parties	Cx Plan, Construction Specifications
General Contractors/Project Manager	Cx Plan, Construction Specifications
Mechanical Contractor, Controls Contractor, Subs-Trades And Manufacturers, Testing And Balancing	Cx Plan, Construction Specifications
Electrical Contractor, Subs-Trades And Manufacturers	Cx Plan, Construction Specifications
Commissioning Authority	Cx Plan, Commissioning Specifications
Architect/Design Engineers	Cx Plan

Team Members

The members of the commissioning team consist of the CA, PM, assigned members of the GC, A/E (particularly the mechanical engineer), the mechanical contractor, electrical contractor, TAB representative, controls contractor, any other installing subcontractors or suppliers of equipment. If known, the Owner's building or plant operator/ engineer is also a member of the commissioning team.

General Management Plan

The CA was hired by the Owner. In general, the CA coordinates the commissioning activities and reports to the Owner. The commissioning responsibilities of all contractors' are detailed in the specifications. The specifications will take contractual precedence over this Cx Plan. All members work together to fulfill their contracted responsibilities and meet the objectives of the Contract Documents. Refer to the management protocols section below.

General Description of Roles

General descriptions of the commissioning roles are as follows:

CA	Coordinates the Cx process, writes tests, oversees and documents performance tests
GC	Facilitates the Cx process, ensures that Subs perform their responsibilities and integrates Cx into the construction process and schedule
Subs	Demonstrate proper system performance
A/E	Perform construction observation, approve O&M manuals and assist in resolving problems
PM	Facilitates and supports the Cx process and gives final approval of the Cx work
Mfr	The equipment manufacturers and vendors provide documentation to facilitate the commissioning work and perform contracted startup

Commissioning Process

This section sequentially details the commissioning process by commissioning task or activity.

Commissioning Plan

The CA finalizes the draft Cx Plan using the information gathered from the scoping meeting, construction meetings, and/or from discussions with the PM. The commissioning schedule is below in Appendix A. The schedule is fine-tuned as construction progresses. The commissioning plan is approved by the PM.

Site Observation

The CA, and PM if applicable, makes periodic visits to the site, as necessary, to witness equipment and system installations.

Miscellaneous Meetings

The CA attends selected planning and job-site meetings in order to remain informed on construction progress and to update parties involved in commissioning. The PM and GC provide the CA with information regarding substitutions, change orders and any Architect's Supplemental Instructions (ASI) that may affect commissioning equipment, systems or the commissioning schedule. The CA may review construction meeting minutes, change orders or ASIs for the same purpose.

Later during construction, necessary meetings between various commissioning team parties will be scheduled by the CA, through the PM, as required.

Miscellaneous Management Protocols

The following protocols will be used on this project.

Issue	Protocol
For requests for information (RFI) or formal documentation requests:	The CA goes first through the PM.
For minor or verbal information and clarifications:	The CA goes direct to the informed party.
For notifying contractors of deficiencies:	The CA documents deficiencies through the PM, but may discuss deficiency issues with contractors prior to notifying the PM.

For scheduling functional tests or training:	The CA may provide input for and do some coordination of training and testing, but scheduling shall be coordinated through the PM.
For scheduling commissioning meetings:	The CA selects the date and schedules through the PM.
For making a request for significant changes:	The CA has no authority to issue change orders.
For making small changes in specified sequences of operations:	The CA may <u>not</u> make changes to specified sequences without approval from the A/E.
Subcontractors disagreeing with requests or interpretations by the CA shall:	Try and resolve with the CA first. Then work through GC who will work with CA directly or through the PM to resolve the situation.

Site Inspections

Prior to the start of construction, the CA and/or the PM will inspect the site, become familiar with the project particularities, “as-is” condition of the site, and other factors affecting the work. During construction, the CA will inspect the project approximately once per month or as necessary. Each site inspection will be followed up with a site inspection report. Site inspection reports will be provided to the PM and GC for review and resolution of deficiencies.

Initial Submittals and Documentation

Standard Submittals

The PM will provide CA with drawings, approved shop drawings, change notices, etc., as required. The GC Coordinator will provide the CA with equipment commissioning requirements that typically includes pre-functional readiness forms, installation and start-up procedures, O&M data, performance data and control drawings. The CA reviews and approves submissions relative to commissioning issues expressed in the contract documents, not for general contract compliance (which is the A/E’s responsibility).

Special Submittals, Notifications and Clarifications

The Subs, GC or A/E notify the CA of any new design intent or operating parameter changes, added control strategies and sequences of operation, or other change orders that may affect commissioned systems. The controls contractor shall provide the CA a full points list with details requested by the CA. Thirty (30) days prior to performing Functional Testing, the Subs provide the CA full details of the procedures. As the phases of the TAB are completed, the draft TAB report is provided to the CA with full explanations of results, data table legends, etc. The final TAB report shall be provided to the CA upon completion.

The submittals to the CA do not constitute compliance for submittals for the O&M manuals. Documentation requirements for the O&M manuals are the A/E's responsibility.

The CA may request additional design narrative from the A/E and from the controls contractor depending on how complete the documentation is that was submitted with the approved shop drawings. The CA may submit written RFIs to contractors through the PM, or address them directly for clarifications, as needed.

Prefunctional Checklists, Tests and Startup

Prefunctional checklists (PC) are important to ensure that the equipment and systems are hooked up and operational and that functional performance testing may proceed without unnecessary delays. Each piece of equipment receives full prefunctional checkout by the Contractor. No sampling strategies are used. In general, the prefunctional testing for a given system, must be successfully completed prior to formal functional performance testing of equipment or subsystems of the given system.

Prefunctional checklists are primarily static inspections and procedures to prepare the equipment or system for initial operation (e.g., oil levels OK, fan belt tension, labels affixed, gages in place, sensor calibration, etc.). However, some prefunctional checklist items entail simple testing of the function of a component, a piece of equipment or system (such as measuring the voltage imbalance on a three phase pump motor of a chiller system). The word prefunctional refers to before functional testing. Prefunctional checklists augment and are combined with the manufacturer's start-up checklist.

Contractors typically already perform some, if not many, of the prefunctional checklist items the commissioning authority will recommend. However, few contractors document in writing the execution of these checklist items. This project requires that the procedures be documented in writing by the installing technician. The CA does not witness much of the prefunctional checklisting, except for testing of larger or more critical pieces of equipment and some spot-checking.

Execution of Checklists and Startup

Four (4) weeks prior to startup, the Subs and vendors schedule startup and initial checkout with the PM, GC and CA. The startup and initial checkout are directed and executed by the Sub or vendor. The CA, and PM if necessary, observe, at minimum, the procedures for each piece of primary equipment, unless there are multiple units, when a sampling strategy is used. For components of equipment, (e.g., VAV boxes), the CA observes a sampling of the prefunctional and start-up procedures.

Commissioning Process

To document the process of startup and checkout, the site technician performing the line item task initials and dates each paragraph of procedures in the “Startup Plan” and checks off items on the prefunctional and manufacturer field checkout sheets, as they are completed. Only individuals having direct knowledge of a line item being completed shall check or initial the forms.

The Subs and vendors execute the checklists and tests and submit a signed copy of the completed start-up and prefunctional tests and checklists to the CA, using Form C-3a or b. The CA may review prefunctional checklists in progress, as necessary. On smaller equipment or projects, the checklists (which all contain more than one trade’s responsibility), may be passed around to the Subs to fill out. For larger projects, each trade may need a full form and the CA will consolidate them later.

Sampling Strategy for CA Observation of Prefunctional Checkout and Startup

The following table provides a tentative list of the equipment and how much of the startup work will be witnessed by the commissioning authority. Observation of prefunctional checklist execution will be at the discretion of the CA.

Equipment or System	Fraction To Be Tested/Observed by CA
Equipment Start-ups	Witness and confirm and review start-up reports to confirm equipment operation under peak demand/load and confirm failure conditions
Electrical and Lighting Systems	25%
ERVs	100%
AC Units	100%
Exhaust Fans	100%
VRF Heat Pumps	100%
Destratification Fans	100%
Pumps	100%
Humidifier	100%
Unit Heaters	100%
DHWH	100%
Pipe Cleaning and Flushing	Witness and verify
Pipe Pressure Testing	Witness and verify
Passive House Pressure Tests	Witness and verify
Wall Assembly	Cx will review wall assembly mock-up prior to installation. Cx will review and visually inspect exterior wall assembly installation prior to closing up – contractors to notify when complete.

Air/Vapour Barrier	Cx will review wall assembly mock-up prior to installation. Cx will review and visually inspect exterior wall assembly installation prior to closing up – contractors to notify when complete
Roofing	Cx will review wall assembly mock-up prior to installation. Cx will review and visually inspect exterior wall assembly installation prior to closing up – contractors to notify when complete
Thermal Scan	Cx will witness thermal scan completed during positive and negative pressure. Cx will review thermal scan report after completion
HVAC Controls	Test and Confirm Control Points and Complete Integrated Systems Testing (testing each input sequence and confirming the appropriate output)
TAB work	Review TAB Report, Witness and confirm air flow and volumes
Other misc. equipment	As necessary

Deficiencies and Non-Conformance

The Subs clearly list any outstanding items of the initial start-up and prefunctional procedures that were not completed successfully at the bottom of the procedures form or on an attached sheet. The procedures form and deficiencies are provided to the CA within two days of test completion. The Subs and vendors are required to correct and retest deficiencies or uncompleted items, involving the PM and others as necessary and provided corrections to prefunctional checklists and start-up reports to the CA. The installing Subs or vendors correct all areas that are deficient or incomplete according to the checklists and tests.

TAB

Where TAB is required, the TAB contractor submits the outline of the TAB plan and approach to the CA and the controls contractor eight (8) weeks prior to starting the TAB. Included in the approach, is an explanation of the intended use of the building control system. The CA reviews the plan and approach for understanding and coordination issues and may comment, but does not “approve.” The controls contractor reviews the feasibility of using the building control system for assistance in the TAB work. The TAB submits weekly written reports of discrepancies, contract interpretation requests and lists of completed tests to the CA and PM. This facilitates quicker resolution of problems and will result in a more complete TAB before functional testing begins.

TAB work will not begin until the control system has been prefunctionally tested and selective functional tests have been performed and approved by the CA.

Controls Checkout Plan

The controls contractor develops and submits a written step-by-step plan to the CA which describes the process they intend to follow in checking out the control system and the forms on which they will document the process. The controls contractor will also meet with the TAB contractor prior to the start of TAB and review the TAB plan to determine the capabilities of the control system for use in TAB. The controls contractor will provide the TAB with any necessary unique instruments for setting terminal unit boxes and instruct TAB in their use (handheld control system interface for use around the building during TAB, etc.). The controls contractor shall also provide a technician qualified to operate the controls to assist the TAB contractor in performing TAB.

The controls contractor shall execute the tests and trend logs assigned to them in prefunctional checklists, calibrations, start-up and selected functional tests and remain on site for assistance for mechanical system functional tests as required.

Development of Functional Test and Verification Procedures

Overview

Functional testing is the dynamic testing of systems (rather than just components) under full operation (e.g., the chiller pump is tested interactively with the chiller functions to see if the pump ramps up and down to maintain the differential pressure setpoint). Systems are tested under various modes, such as during low cooling or heating loads, high loads, component failures, unoccupied, varying outside air temperatures, fire alarm, power failure, etc. The systems are run through all of the control system's sequences of operation and components are verified to be responding as the sequences state. The CA develops the functional test procedures in a written form, which is performed by the installing contractor or vendor.

Development Process

Before test procedures are written, the PM and A/E will provide the CA with all requested documentation and a current list of change orders affecting equipment or systems, including an updated points list, control sequences and setpoints. The CA develops specific test procedures to verify proper operation of each piece of equipment and system. When necessary, the A/E and Contractors will provide the CA with clarification regarding sequences and operation to develop these tests. Prior to execution, the CA provides a copy of the primary equipment tests to the installing Sub (via the GC) who reviews the tests for feasibility, safety, warranty and equipment protection.

Functional testing and verification may be achieved by manual testing (persons manipulate the equipment and observe performance) or by monitoring the performance and analyzing the

results using the control system's trend log capabilities or by stand-alone dataloggers. The CA follows the Specifications when provided and uses judgment where needed to determine which method is most appropriate. According to the Specifications, not all pieces of identical equipment receive in-depth testing. The CA reviews owner-contracted, factory or required owner acceptance tests and determines what further testing may be required to comply with the Specifications. Redundancy is minimized.

Execution of Functional Testing Procedures

Overview and Process

The CA schedules functional tests through the PM, GC and affected Subs. For any given system, prior to performing functional testing, the CA waits until the prefunctional checklist has been submitted with the necessary signatures, confirming that the system is ready for functional testing. The CA oversees, witnesses and documents the functional testing of all equipment and systems according to the Specifications and the Cx Plan. The Subs execute the tests. The control system is tested before it is used to verify performance of other components or systems. The air balancing and water balancing is completed and debugged before functional testing of air-related or water-related equipment or systems. Testing proceeds from components to subsystems to systems and finally to interlocks and connections between systems.

Deficiencies and Retesting

The CA documents the results of the test. Corrections of minor deficiencies identified are made during the tests at the discretion of the CA. The CA records the results of the test. Deficiencies or non-conformance issues are noted and reported to the PM. GCs are responsible to manage Subs to correct deficiencies, and notify the CA of corrections. The CA may choose to retesting through the PM if deemed necessary. Decisions regarding deficiencies and corrections are made between CA or PM and the GC/Sub. For areas in dispute, final authority, resides with the PM (Owner).

Facility Staff Preparation

The Owner's facilities operating staff are encouraged to attend and participate in the testing process. The CA will notify the PM, who will then notify the facility staff when the commissioning events will occur.

Sampling

Multiple identical pieces of non-life-safety or otherwise non-critical equipment may be functionally tested using a sampling strategy to be determined at the discretion of the CA.

O&M Manuals and Warranties

Standard O&M Manuals

The CA verifies the completeness of the O&M manuals to ensure that all required material is included (names and addresses of contractors and sub-trades, warranties and certificates, reviewed shop drawings, diagrams, etc).

Commissioning Report

At the conclusion of the commissioning work, a final commissioning report shall be compiled and submitted to the Board. The format of the commissioning report is as follows:

TAB 1	All records, minutes and documentation related to site inspections performed by the CA during the construction process.
TAB 2	Records of all other meetings, discussions and other coordination activities between the CA and the PM, GC, A/E, and/or Subs.
TAB 3	Copies of all equipment start-ups and balancing reports received from the Contractor.
TAB 4	All signed pre-functional tests confirming acceptance by the CA. Initially rejected pre-functional sheets shall be included, indicating deficiencies found. Repeated test check sheets shall be included, together with a description of the corrective actions taken by the contractor.
TAB 5	All signed functional tests confirming acceptance by the commissioning agent. Initially rejected functional sheets shall be included, indicating deficiencies found. Repeated test check sheets shall be included, together with a description of the corrective actions taken by the contractor.
TAB 6	Contractor training materials, training sign-in sheets, and any other training materials provided.
TAB 7 + Electronic Format	Confirmation by the CA that the O&M manuals have been reviewed, found complete, in accordance with the design specifications and were transferred to the Owner's Representative in both hard copy and electronic format.
Electronic Format	Final as-build documentation in electronic format.

Training of Owner Personnel

The CA shall witness the training process and certify that the Owner's facility staff has been trained to use and troubleshoot each system included in the project. The training shall be conducted by the Contractor, using own forces or retaining manufacturer's representatives, as

Commissioning Process

necessary. CA will confirm that training shall include the following the topics in the tables below.

Basis of System Design, Operational Requirements, and Criteria

	System, subsystem, and equipment descriptions.
	Performance and design criteria if Contractor is delegated design responsibility
	Operating standards
	Regulatory requirements
	Equipment function
	Operating characteristics
	Limiting conditions
	Performance curves

Emergencies

	Instructions on meaning of warnings, trouble indications, and error messages
	Instructions on stopping
	Shutdown instructions for each type of emergency
	Operating instructions for conditions outside of normal operating limits
	Sequences for electric or electronic systems
	Special operating instructions and procedures

Operations

	Startup procedures
	Equipment or system break-in procedures
	Routine and normal operating instructions
	Regulation and control procedures
	Control sequences
	Safety procedures
	Instructions on stopping
	Normal shutdown instructions
	Operating procedures for emergencies
	Operating procedures for system, subsystem, or equipment failure
	Seasonal and weekend operating instructions
	Required sequences for electric or electronic systems
	Special operating instructions and procedures

Adjustments

	Alignments
	Checking adjustments
	Noise and vibration adjustments
	Economy and efficiency adjustments

Troubleshooting

	Diagnostic instructions
	Test and inspection procedures

Maintenance

	Inspection procedures
	Types of cleaning agents to be used and methods of cleaning
	List of cleaning agents and methods of cleaning detrimental to product
	Procedures for routine cleaning
	Procedures for preventive maintenance
	Procedures for routine maintenance
	Instruction on use of special tools

Repairs

Commissioning Process

	Diagnosis instructions
	Repair instructions
	Disassembly; component removal, repair, and replacement; and reassembly instructions
	Instructions for identifying parts and components
	Review of spare parts needed for operation and maintenance

Appendix A: Commissioning Schedule

Scheduling Priorities

The following sequential priorities are followed:

- 1) Equipment is not “temporarily” started (for heating or cooling), until pre-start checklist items and all manufacturer’s pre-start procedures are completed and moisture, dust and other environmental and building integrity issues have been addressed.
- 2) Functional testing is not begun until prefunctional and start-up and TAB is completed, for a given system (this does not preclude a phased approach).
- 3) The controls system and equipment it controls are not functionally tested until all points have been calibrated and pre-functional testing completed.
- 4) TAB is not performed until the controls system has been sufficiently functionally tested and approved by the CA for TAB work, except for
- 5) TAB is not performed until the envelope is completely enclosed and ceiling complete, unless the return are is ducted.

Project Schedule

The commissioning schedule is summarized in the table below. The commissioning schedule may change as construction progresses.

Task/Activity	Date
Construction Commissioning Plan Issued	TBD
Prefunctional forms developed and distributed	TBD
Building Envelope Mock-Up Inspections	TBD
M&E Rough-In Inspections and Pressure Testing	TBD
Pipe Cleaning and Flushing	TBD
Hydronic System Pressure Tests	TBD
Startup and initial checkout executed	TBD
TAB	TBD
Passive House Pressure Tests	TBD
Thermal Scans	TBD
Functional performance tests	TBD
IAQ Testing or Air Flushing (LEED Requirement)	TBD
O&M documentation verification	TBD
Training and training verification	TBD
Seasonal testing	TBD

Part 1 General

1.1 SUMMARY

- .1 Section Includes:
 - .1 Commissioning forms to be completed for equipment, system and integrated system.

1.2 INSTALLATION/START-UP CHECK LISTS

- .1 Include the following data:
 - .1 Product manufacturer's installation instructions and recommended checks.
 - .2 Special procedures as specified in relevant technical Sections.
 - .3 Items considered good installation and engineering industry practices deemed appropriate for proper and efficient operation.
- .2 Equipment manufacturer's installation/start-up check lists are acceptable for use. As deemed necessary by Commissioning Agent supplemental additional data lists will be required for specific Project conditions.
- .3 Use check lists for equipment installation. Document check list verifying checks have been made, indicate deficiencies and corrective action taken.
- .4 Installer to sign check lists upon completion, certifying stated checks and inspections have been performed. Return completed check lists to Commissioning Agent. Check lists will be required during Commissioning and will be included in Building Maintenance Manual (BMM) at completion of Project.
- .5 Use of check lists will not be considered part of commissioning process but will be stringently used for equipment pre-start and start-up procedures.

1.3 PRODUCT INFORMATION (PI) REPORT FORMS

- .1 Product Information (PI) forms compiles gathered data on items of equipment produced by equipment manufacturer, includes nameplate information, parts list, operating instructions, maintenance guidelines and pertinent technical data and recommended checks that is necessary to prepare for start-up and functional testing and used during operation and maintenance of equipment. This documentation is included in the BMM at completion of Work.
- .2 Prior to Performance Verification (PV) of systems complete items on PI forms related to systems and obtain Commissioning Agent's approval.

1.4 PERFORMANCE VERIFICATION (PV) FORMS

- .1 PV forms to be used for checks, running dynamic tests and adjustments carried out on equipment and systems to ensure correct operation, efficiently and function independently and interactively with other systems as intended with Project requirements.

- .2 PV report forms include those developed by Contractor records measured data and readings taken during functional testing and Performance Verification procedures.
- .3 Prior to PV of integrated system, complete PV forms of related systems and obtain Commissioning Agent's approval.

1.5 SAMPLES OF COMMISSIONING FORMS

- .1 Commissioning Agent will develop and provide to Contractor required Project-specific Commissioning forms in electronic format complete with Specification data.
 - .1 Integrated Systems Testing of Fire Protection and Life Safety Systems.
- .2 Revise items on Commissioning forms to suit Project requirements.
- .3 Samples of Commissioning forms and a complete index of produced to date will be attached to this Section.

1.6 CHANGES AND DEVELOPMENT OF NEW REPORT FORMS

- .1 When additional forms are required, but are not available from Commissioning Agent develop appropriate verification forms and submit to Commissioning Agent for approval prior to use.
 - .1 Additional commissioning forms to be in same format as provided by Commissioning Agent.

1.7 COMMISSIONING FORMS

- .1 Use Commissioning forms to verify installation and record performance when starting equipment and systems.
- .2 Strategy for Use:
 - .1 Commissioning Agent provides Contractor Project-specific Commissioning forms with Specification data included.
 - .2 Contractor will provide required Shop Drawings information and verify correct installation and operation of items indicated on these forms.
 - .3 Confirm operation as per design criteria and intent.
 - .4 Identify variances between design and operation and reasons for variances.
 - .5 Verify operation in specified normal and emergency modes and under specified load conditions.
 - .6 Record analytical and substantiating data.
 - .7 Verify reported results.
 - .8 Form to bear signatures of recording technician and reviewed and signed off by Commissioning Agent.
 - .9 Submit immediately after tests are performed.
 - .10 Reported results in true measured SI unit values.
 - .11 Provide Commissioning Agent with originals of completed forms.

- .12 Maintain copy on site during start-up, testing and commissioning period.
- .13 Forms to be both hard copy and electronic format with typed written results in Building Management Manual.

1.8 LANGUAGE

- .1 To suit the language profile of the awarded Contract.

COMMISSIONING

Integrated Systems Testing of Fire Protection and Life Safety Systems

_____ on behalf of
Name of Company or Person Performing Integrated Systems Testing
(INTEGRATED TESTING COORDINATOR)

_____ has developed
Name of Building Owner or Designer/Design Engineer
and implemented the integrated testing plan at:

Address of Installation (Municipality)

This test was carried out as required by the Ontario Building Code, and in accordance with the appropriate standard noted below.

_____ hereby confirms
that

Name of Company or Person Performing Integrated Systems Testing

on _____, the integrated testing was performed in accordance with integrated
Month/Day/Year

testing plan to ensure proper operation & inter-relationship between the systems per original design prepared by _

Name of Designer

And subsequently updated to "As-Built" status by: _

Name of Contractor

The integrated testing was performed on _____ and proper operation and
Month/Day/Year

inter-relationship between the systems found to be fully operational in accordance with:

1. The Ontario Building Code, and
2. CAN/ULC 1001-11 Standard for Integrated Systems Testing of Fire Protection and Life Safety Systems.

Note: Interconnection between the following integrated systems was subject to the test:

<input type="checkbox"/> fire alarm systems,	<input type="checkbox"/> elevator recalls,
<input type="checkbox"/> sprinkler & standpipes systems,	<input type="checkbox"/> emergency power,
<input type="checkbox"/> fire pumps	<input type="checkbox"/> emergency lighting,
<input type="checkbox"/> electromagnetic locks,	<input type="checkbox"/> smoke and fire shutters and dampers,
<input type="checkbox"/> door hold-open devices,	<input type="checkbox"/> smoke control, ventilation, pressurization,
<input type="checkbox"/> kitchen fire suppression	<input type="checkbox"/> other

Name of Company or Person Performing Integrated Systems Testing Signature or Person Responsible for Test

Note: Modifications to the integrated system after _____ will invalidate this Certificate.

Month/Day/Year

Signature of Person Assuming Responsibility for Test

Part 1 General

1.1 SUMMARY

- .1 Section Includes:
 - .1 Removal of existing construction necessary to permit installation or performance of other Work and fitting and repairing work required to restore surfaces to original conditions after installation of other Work.
- .2 Related Requirements:
 - .1 Section 03 35 00 – Concrete Finishing
 - .2 Section 09 21 16 – Gypsum Board Assemblies

1.2 REFERENCES

- .1 Definitions:
 - .1 Cutting: Removal of existing construction necessary to permit installation or performance of other Work.
 - .2 Patching: Fitting and repair work required to restore surfaces to original conditions after installation of other Work.
- .2 Reference Standards:
 - .1 Canada Green Building Council (CaGBC):
 - .1 LEED Canada V4 – Building Design and Construction (BD+C).

1.3 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Cutting and Patching Proposal: Submit a proposal describing procedures at least 10 days before the time cutting and patching will be performed, requesting approval to proceed. Include the following information:
 - .1 Extent: Describe cutting and patching, show how they will be performed, and indicate why they cannot be avoided.
 - .2 Changes to Existing Construction: Describe anticipated results. Include changes to structural elements and operating components as well as changes in building's appearance and other significant visual elements.
 - .3 Products: List products to be used and firms or entities that will perform the Work.
 - .4 Dates: Indicate when cutting and patching will be performed.
 - .5 Utilities: List utilities that cutting and patching procedures will disturb or affect. List utilities that will be relocated and those that will be temporarily out of service. Indicate how long service will be disrupted.
 - .6 Structural Elements: Where cutting and patching involve adding reinforcement to structural elements, submit details and engineering calculations showing integration of reinforcement with original structure to the Consultant prior to making cuts or modifications.
 - .7 Consultant's Acceptance: Obtain acceptance of cutting and patching proposal before cutting and patching. Review and acceptance of cutting and patching proposal does not waive right to later require removal and replacement of unsatisfactory work.

- .2 LEED Submittals: provide LEED submittals in accordance with Section 01 61 00 - LEED Product Requirements.

1.4 QUALITY ASSURANCE

- .1 Structural Elements: Do not cut and patch structural elements in a manner that could change their load carrying capacity or load deflection ratio.
- .2 Operational Elements: Do not cut and patch operating elements and related components in a manner that results in reducing their capacity to perform as intended or that results in increased maintenance or decreased operational life or safety, including but not limited to the following:
 - .1 Primary operational systems and equipment.
 - .2 Air or smoke barriers.
 - .3 Fire protection systems.
 - .4 Control systems.
 - .5 Communication systems.
 - .6 Electrical wiring systems.
- .3 Miscellaneous Elements: Do not cut and patch the following elements or related components in a manner that could change their load carrying capacity, that results in reducing their capacity to perform as intended, or that results in increased maintenance or decreased operational life or safety, including but not limited to the following:
 - .1 Water, moisture, or vapour barriers.
 - .2 Membranes and flashings.
 - .3 Exterior curtain wall construction.
 - .4 Equipment supports.
 - .5 Piping, ductwork, vessels, and equipment.
 - .6 Noise and vibration control elements and systems.
- .4 Visual Requirements: Do not cut and patch construction in a manner that results in visual evidence of cutting and patching. Do not cut and patch construction exposed on the exterior or in occupied spaces in a manner that would, in Consultant's opinion, reduce the building's aesthetic qualities. Remove and replace construction that has been cut and patched in a visually unsatisfactory manner. If possible, retain original Installer or fabricator to cut and patch exposed Work listed below. If it is impossible to engage original Installer or fabricator, engage another recognized, experienced, and specialized firm, including but not limited to the following:
 - .1 Processed concrete finishes.
 - .2 Masonry.
 - .3 Ornamental metal.
 - .4 Firestopping and smoke seals.
 - .5 Finished flooring.
 - .6 Finished coatings.
 - .7 Wall covering.

- .8 HVAC enclosures, cabinets, or covers.
- .5 Cutting and Patching Conference: Before proceeding, meet at Project site with parties involved in cutting and patching, including mechanical and electrical trades. Review areas of potential interference and conflict. Coordinate procedures and resolve potential conflicts before proceeding.
- .6 Should material resembling spray or trowel-applied asbestos or other designated substance listed as hazardous as defined in the Hazardous Product Act be encountered, stop work, take preventative measures, and notify Consultant and Owner immediately.

1.5 WARRANTY

- .1 Existing Warranties: Remove, replace, patch, and repair materials and surfaces cut or damaged during cutting and patching operations, by methods and with materials so as not to void existing warranties.

Part 2 Products

2.1 MATERIALS

- .1 General: Comply with requirements specified in other Sections of these Specifications.
- .2 Existing Materials: Use materials identical to existing materials. For exposed surfaces, use materials that visually match existing adjacent surfaces to the fullest extent possible:
 - .1 If identical materials are unavailable or cannot be used, use materials that, when installed, will match the visual and functional performance of existing materials.

Part 3 Execution

3.1 EXAMINATION

- .1 Examine surfaces to be cut and patched and conditions under which cutting and patching are to be performed and in accordance with Delegated Design Requirements:
 - .1 Provide X-ray or other approved methods to determine locations of existing services and reinforcing in existing concrete slabs and block walls before cutting and renovations. Advise Consultant of findings before proceeding with the Work and revise penetration locations as required and directed by Consultant. Existing concrete slab thickness is to be confirmed by Contractor.
 - .2 Compatibility: Before patching, verify compatibility with and suitability of substrates, including compatibility with existing finishes or primers.
 - .3 Proceed with installation only after unsafe or unsatisfactory conditions have been corrected.

3.2 PREPARATION

- .1 Temporary Support: Provide temporary support of Work to be cut.
- .2 Protection: Protect existing construction during cutting and patching to prevent damage. Provide protection from adverse weather conditions for portions of Project that might be exposed during cutting and patching operations.
- .3 Adjoining Areas: Avoid interference with use of adjoining areas or interruption of free passage to adjoining areas.
- .4 Existing Services: Where existing services are required to be removed, relocated, or abandoned, bypass such services before cutting to minimize interruption of services to occupied areas.

3.3 PERFORMANCE

- .1 General: Employ skilled workers to perform cutting and patching. Proceed with cutting and patching at the earliest feasible time, and complete without delay:
 - .1 Cut existing construction to provide for installation of other components or performance of other construction, and subsequently patch as required to restore surfaces to their original condition.
- .2 Cutting: Cut existing construction by sawing, drilling, breaking, chipping, grinding, and similar operations, including excavation, using methods least likely to damage elements retained or adjoining construction. If possible, review proposed procedures with original Installer; comply with original Installer's written recommendations:
 - .1 In general, use hand or small power tools designed for sawing and grinding, not hammering and chopping. Cut holes and slots as small as possible, neatly to size required, and with minimum disturbance of adjacent surfaces. Temporarily cover openings when not in use.
 - .2 Existing Finished Surfaces: Cut or drill from the exposed or finished side into concealed surfaces.
 - .3 Concrete or Masonry: Cut using a cutting machine, such as an abrasive saw or a diamond core drill.
 - .4 Mechanical and Electrical Services: Cut off pipe or conduit in walls or partitions to be removed. Cap, valve, or plug and seal remaining portion of pipe or conduit to prevent entrance of moisture or other foreign matter after cutting.
 - .5 Proceed with patching after construction operations requiring cutting are complete.
- .3 Patching: Patch construction by filling, repairing, refinishing, closing up, and similar operations following performance of other Work. Patch with durable seams that are as invisible as possible. Provide materials and comply with installation requirements specified in other Sections of these Specifications:
 - .1 Inspection: Where feasible, test and inspect patched areas after completion to demonstrate integrity of installation.
 - .2 Exposed Finishes: Restore exposed finishes of patched areas and extend finish restoration into retained adjoining construction in a manner that will eliminate evidence of patching and refinishing.

- .3 Floors and Walls: Where walls or partitions that are removed extend from one finished area into another, patch and repair floor and wall surfaces in the new space. Provide an even surface of uniform finish, colour, texture, and appearance. Remove existing floor and wall coverings and replace with new materials, if necessary, to achieve uniform colour and appearance.
- .4 Where patching occurs in a painted surface, apply primer and intermediate paint coats over the patch and apply final paint coat over entire unbroken surface containing the patch. Provide additional coats until patch blends with adjacent surfaces.
- .5 Ceilings: Patch, repair, or re-hang existing ceilings as necessary to provide an even plane surface of uniform appearance.
- .6 Maintain existing fire ratings as required.

END OF SECTION

Part 1 General

1.1 DEFINITIONS

- .1 The following Definitions shall apply in this Specification:
- .2 Contract Documents
 - .1 The Contract Documents consist of the Drawings, Specifications and Reports which form part of the agreed Contract.
- .3 Consultant
 - .1 The Consultant is the Architect, SEOR, persons or entities engaged by the Owner. The term Consultant means the Consultant or the Consultant's authorized representative.
- .4 Contractor
 - .1 The term Contractor is defined to include any of the following: Construction Manager, General Contractor, Structural Steel Erector, Structural Steel Fabricator, Subcontractor or Supplier.
- .5 Owner
 - .1 The Owner is the person or entity identified as such in the Contract. The term Owner means the Owner or the Owner's authorized agent or representative but does not include the Consultant.
- .6 SEOR
 - .1 The SEOR is defined as the Structural Engineer of Record for the Contract.

1.2 WORK INCLUDED

- .1 Comply with Division 1, General Requirements and all documents referred to therein.
- .2 Provide all labour, materials, plant and equipment necessary to perform structural alterations indicated or noted on the drawings and as specified herein.
 - .1 Verification of field conditions and dimensions.
 - .2 Design of shoring, needling, and associated bracing along with the necessary foundations thereto as required to safely install new structural members.
 - .3 Temporary shoring, needling, and associated bracing and where necessary jacking of existing work and removal thereof as required to safely install new structural members.

1.3 RELATED WORK SPECIFIED ELSEWHERE

- .1 Demolition of Structure, Section 02 41 19.
- .2 Concrete Forming, Section 03 10 00.

- .3 Concrete Reinforcement, Section 03 20 00.
- .4 Cast-in-Place Concrete, Section 03 30 00.
- .5 Structural Steel, Section 05 12 00.

1.4 REFERENCE STANDARDS, CODE AND ACTS

- .1 Conform to Ontario Regulation 332/12 (The Building Code) as amended by all subsequent Ontario Regulations issued to the date of this specification and applicable acts of authorities having jurisdiction.
 - .1 CSA A23.1-09 - Concrete Materials and Methods of Concrete Construction.
 - .2 CSA A23.2-09 - Test Methods and Standard Practices for Concrete.
 - .3 CSA S16-09 - Design of Steel Structures.
 - .4 CSA S269.1-1975 (R2003) - Falsework for Construction Purpose
- .2 Where there are differences between the specifications and drawings and the codes, standards and acts, the most stringent shall govern.

1.5 GENERAL

- .1 The drawings governing alterations to existing structural work were prepared using the following assumptions:
 - .1 The existing building is built in accordance with the original contract documents, significant details of which have been reproduced on the drawings.
 - .2 The workmanship and materials employed on the existing buildings were of good quality and the building has not deteriorated significantly.
 - .3 Bearing walls, structural steel, and structural concrete framing is reasonably true and plumb.
 - .4 Existing building documents used in preparing the documents for this contract include the following:
 - .1 Building Permit and Tender by URS Architects & Engineers Canada Inc. dated June 9, 2005.
 - .2 Issued for Construction by Engineering Link dated April 9, 2018

1.6 EXAMINATION

- .1 Examine the site and buildings on it. Establish conditions under which the work is to be done, and accept the premises as found upon taking possession of the property. The Owner will make no allowance for conditions that were apparent at the time of submission of tender. Direct all inquiries to the Consultant.
- .2 Before proceeding with alterations to structural members, verify that the existing building information shown on the drawings and the assumptions described above are correct. Should the drawing or the assumptions described above not

be correct, notify the Consultant immediately. The Consultant will determine revisions necessary to the work as shown. The Contractor shall provide the necessary assistance to enable the Consultant to determine the extent of the revisions necessary.

- .3 Investigate the existing building to determine actual field conditions, take field dimensions, ascertain loads and forces to be supported or resisted, probe structural bearing members to determine soundness, and perform other inspection as deemed necessary to carry out design of shoring, needling, bracing, and the like, to schedule the sequence of operations, and prepare shop drawings and details.

1.7 DESIGN

- .1 Design shoring, bracing, needling, scaffolding, and the like, along with the necessary foundations so that loads applied to them will be safely carried. Superimposed live loads, construction loads, and wind loads shall be taken into account and the lateral stability of the elements supported and the shoring and needling shall be insured.
- .2 The members requiring shoring or needling, the elements to be altered, the general sequence of operations and in some circumstances the type of needling and shoring are shown. These general requirements shall govern the design.
- .3 The design of shoring, needling and foundations thereto and the sequence of their installation and sequence of the work shall be prepared by a Professional Engineer licensed in the Province of Ontario.
- .4 Prepare design of shoring, and the like, in co-operation with other trades so that new work may be installed as required.

1.8 RESPONSIBILITY

- .1 The Contractor shall be responsible for all damage arising out of the work of the Contract and for all damage to adjacent private or public property. The Contractor shall make good damages caused in the performance of this contract to the satisfaction of the Consultant.
- .2 Review of shoring and needling design drawings by the Consultant shall in no way relieve the Contractor of its responsibility for carrying out the work in a manner which ensures the complete safety of the existing work, persons, and adjacent property and also ensures that no damage occurs thereto, during any period of the alterations.

1.9 SUBMITTALS

- .1 Prepare and submit to the Consultant drawings fully describing the shoring, needling, bracing and scaffolding work, the sequence of their installation and removal and the sequence of alterations.
- .2 Each drawing submitted shall bear the signature and stamp of a qualified Professional Engineer licensed in the Province of [Ontario]

- .3 Submit calculations to the Consultant if requested.
- .4 The Professional Engineer employed to design the shoring, bracing, needling and the like shall also be employed to fully supervise their installation and removal and shall submit weekly reports to the Consultant regarding these phases of the work.

Part 2 Products

2.1 Materials

- .1 Concrete, grouting, formwork and reinforcing steel shall conform to the requirements of CSA A23.1.
- .2 Structural Steel shall conform to the requirements of CSA S16.

Part 3 Execution

- 3.1 Carry out shoring and needling by means of jacking, wedging, or by other suitable means so that load is transferred to the shoring and needling without damaging the work supported. Ensure that over wedging does not damage the work.

3.2 Cutting and coring of Existing Structures

- .1 All dimensions provided by the Consultants are to be confirmed with the appropriate Contractor prior to cutting/coring.
- .2 Any revisions to the dimensions provided by the Consultants must be reviewed by the Consultants prior to cutting/coring.
- .3 Unless noted otherwise, no reinforcement is permitted to be cut when new openings are cut through the existing structure.
- .4 Do not cut or damage any existing post-tensioned tendons.
- .5 Prior to cutting the existing structure, all reinforcement (including any post-tensioned tendons) in the affected areas is to be located by a positive means, (i.e. x-raying, local chipping of slab, or use of cover meter) unless otherwise permitted by the Consultant and as shown on the drawings.
- .6 After reinforcement has been located in these areas, notify Consultant who will review the prior to cutting/coring. Make any necessary adjustments to the holes locations as required by the Consultant.
- .7 For any openings which are to be sawcut into the existing structure, pre-drill the corners using a 100 mm (4") diameter core drill. Do not overcut corners of opening.
- .8 For any areas where reinforcement is cut, the Contractor is to indicate the direction and layer of reinforcement on the as built drawings.
- .9 Where the drawings call for existing reinforcement to be exposed without cutting, take measures to ensure the existing reinforcement is exposed without being damaged.

3.3 QUALITY CONTROL

- .1 Spec. Note: Review sub-sections Quality Control, Notification, Inspection and Testing and Defective Materials and Work with Architect/Client. These sections all, or in part, may better be placed in General Conditions. If so, do not include here, but satisfy yourself that these sections are adequately covered in the General Conditions. If they are not, provide the Architect with suggested revisions. Our specification sections must not conflict with those found in the General Conditions.
- .2 Implement a system of quality control to ensure that the minimum standards specified herein are attained.
- .3 Bring to the attention of the Consultant any defects in the work or departures from the Contract Documents which may occur during Construction. The Consultant will decide upon corrective action and give his recommendations in writing.
- .4 The Consultant's general review during construction and inspection and testing by independent inspection and testing agencies reporting to the Consultant are both undertaken to inform the Owner of the Contractor's performance and shall in no way augment the Contractor's quality control or relieve the Contractor of contractual responsibility.

3.4 NOTIFICATION

- .1 Prior to commencing significant segments of the work, give the Consultant and independent inspection and testing agencies appropriate notification so as to afford them reasonable opportunity to review the work. Failure to meet this requirement may be cause for the Consultant to classify the work as defective.

3.5 Inspection and Testing

- .1 Independent inspection and testing agencies shall be engaged by the Construction Manager for the purpose of inspecting and/or testing portions of the Work. Independent inspection/testing agencies engaged by the Construction Manager shall be acceptable to and approved by the Consultant.

3.6 DEFECTIVE MATERIALS AND WORK

- .1 Where evidence exists that defective work has occurred or that work has been carried out incorporating defective materials, the Consultant may have tests, concrete coring, inspections or surveys performed, analytical calculations of structural strength made and the like in order to help determine whether the work must be repaired or replaced. Tests, inspections or surveys or calculations carried out under these circumstances will be made at the Contractor's expense, regardless of their results, which may be such that, in the Consultant's opinion, the work may be acceptable.
- .2 All testing shall be conducted in accordance with the requirements of the Ontario Building Code, except where this would in the Consultant's opinion cause undue delay or give results not representative of the rejected material in place. In this

case, the tests shall be conducted in accordance with the standards given by the Consultant.

- .3 Materials or work which fail to meet specified requirements may be rejected by the Consultant whenever found at any time prior to final acceptance of the work regardless of previous inspection. If rejected, defective materials or work shall be promptly removed and replaced or repaired to the satisfaction of the Consultant, at no expense to the Owner.

END OF SECTION 02 20 10

Part 1 General

1.1 SUMMARY

.1 Section Includes:

- .1 This Section requires the selective removal and subsequent offsite disposal of site items as indicated on Drawings. Do not disturb items identified to remain in place.

1.2 REFERENCES

.1 Definitions:

- .1 Demolish: Detach items from existing construction and legally dispose of them off site, unless indicated to be removed and salvaged or removed and reinstalled.
- .2 Remove and Salvage: Detach items from existing construction and deliver them to Owner.
- .3 Remove and Reinstall: Detach items from existing construction, prepare them for reuse, and reinstall them where indicated.
- .4 Existing to Remain: Existing items of construction that are not to be removed and that are not otherwise indicated to be removed, removed and salvaged, or removed and reinstalled.

.2 Reference Standards:

- .1 Canada Green Building Council (CaGBC):
 - .1 LEED Canada V4 – Building Design and Construction (BD+C).
- .2 Canadian Standards Association (CSA Group):
 - .1 CSA S350-M1980 (R2003), Code of Practice for Safety in Demolition of Structures.
- .3 Department of Justice Canada (Jus):
 - .1 Transportation of Dangerous Goods Act, 1992 (TDGA), c. 34.
- .4 Provincial Legislation:
 - .1 Legislation specific to Authority Having Jurisdiction for work governed by this Section.

1.3 ADMINISTRATIVE REQUIREMENTS

.1 Pre-Construction Meeting: Arrange a pre-construction meeting attended by Contractor's key personnel, Subcontractors representatives, and Consultant to discuss the following:

- .1 Verify project requirements.
- .2 Review demolition conditions.
- .3 Coordination with other Subcontractors affected by work of this Section.
- .4 Examine existing site conditions adjacent to demolition work, prior to start of Work.
- .5 Waste reporting requirements.

1.4 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Submit in accordance with Section 01 33 00 – Submittal Procedures.
 - .1 Submit Workplace Hazardous Materials Information System WHMIS SDS - Safety Data Sheets. WHMIS SDS acceptable to Labour Canada and Health and Welfare Canada.
- .2 Certificates: Submit copies of certified weigh bills, bills of lading or receipts from authorized disposal sites and re-use and recycling facilities for material removed from site on weekly basis.
- .3 LEED Submittals: provide LEED submittals in accordance with Section 01 61 00 - LEED Product Requirements

1.5 QUALITY ASSURANCE

- .1 Regulatory Requirements: Perform work as follows; use most restrictive requirements where differences occur between the municipal, provincial and federal jurisdictions:
 - .1 Provincial and Federal Requirements: Perform work in accordance with governing environmental notification requirements and regulations of the Authority Having Jurisdiction.
 - .2 Municipal Requirements: Perform hauling and disposal operations in accordance with regulations of Authority Having Jurisdiction.

1.6 DELIVERY, STORAGE, AND HANDLING

- .1 Except where otherwise specified, all materials indicated or specified to be permanently removed from the Place of the Work shall become Contractor's property. Maximize to the fullest extent possible, salvage, and recycling of such materials, consistent with proper economy and expeditious performance of the Work.
- .2 To reduce the quantity of material otherwise destined for disposal at a landfill, the Contractor is encouraged to consider utilizing the services of businesses and non-profit organizations that specialize in salvage and recycling of used building materials, but does so at his own option and risk.
- .3 A current listing of recyclers specializing in specific categories of materials may be obtained during normal office hours from:

Ministry of Environment
Public Information Centre
Phone: (416) 325-4000 or 1-800-565-4923
or by viewing
Ontario Environment Business Directory (OEBD)
Website: www.ontario.ca/page/ontario-environment-business-directory
- .4 Packaging Waste Management
 - .1 Separate and recycle waste materials in accordance with Section 01 74 19 – Construction Waste Management.

1.7 SITE CONDITIONS

- .1 Protect open excavations in accordance with requirements of the Authorities Having Jurisdiction.
- .2 Protect existing site features to remain or identified for salvage or re-use; make repairs and restore to a similar condition to existing where damage to these items occurs as directed by the Consultant and at no cost to Owner:
 - .1 Remove and store salvaged materials to prevent damage.
 - .2 Store and protect salvaged materials as required for maximum preservation of material.
 - .3 Handle salvaged materials the same as new materials.
- .3 Perform selective site demolition work to prevent adverse affects to adjacent watercourses, groundwater and wildlife, and to prevent excess air and noise pollution:
 - .1 Do not dispose of volatile waste materials including but not limited to, mineral spirits, oil, petroleum based lubricants, or toxic cleaning solutions into watercourses, storm or sanitary sewers; follow proper disposal procedures throughout the project.
 - .2 Do not pump water containing suspended materials into watercourses, storm or sanitary sewers or onto adjacent properties.
 - .3 Control disposal or runoff of water containing suspended materials or other harmful substances in accordance with Authorities Having Jurisdiction.
- .4 Protect existing site features and structures, trees, plants and foliage on site and adjacent properties.
- .5 Notify Consultant before disrupting building access or services.
- .6 Should material resembling designated substance listed as hazardous as defined in the Hazardous Product Act be encountered, stop work, take preventative measures, and notify Consultant and Owner immediately.

Part 2 Products

2.1 EQUIPMENT

- .1 Use equipment suitable for work identified.
- .2 Leave machinery running only while in use, except where extreme temperatures prohibit shutting machinery down.

Part 3 Execution

3.1 PREPARATION

- .1 Inspect with Consultant and verify extent and location of items designated for removal, disposal, alternative disposal, recycling, salvage and items to remain.

- .2 Locate and protect utilities. Preserve active utilities traversing site in operating condition.
- .3 Notify and obtain approval of utility companies before starting demolition.
- .4 Disconnect and Cap Identified Mechanical Services:
 - .1 Natural Gas Supply Lines: Remove in accordance with gas company requirements.
 - .2 Sewer and Water Lines: in accordance with Authorities Having Jurisdiction requirements, and securely plug to form watertight seal.
 - .3 Other Underground Services: Remove and dispose of as indicated on Drawings.
- .5 Immediately notify Consultant and utility company concerned in case of damage to any utility or service, designated to remain in place.
- .6 Immediately notify the Consultant should uncharted utility or service be encountered, and await instruction in writing regarding remedial action.
- .7 Protection of In-Place Conditions
 - .1 Prevent movement, settlement, or damage to adjacent structures, utilities, and landscaping features and parts of building to remain in place. Provide bracing and shoring required.
 - .2 Keep noise, dust, and inconvenience to occupants to minimum.
 - .3 Protect building systems, services and equipment.
 - .4 Provide temporary dust screens, covers, railings, supports and other protection as required.
 - .5 Do Work in accordance with Ontario Occupational Health and Safety Act.

3.2 REMOVAL AND DEMOLITION OPERATIONS

- .1 Remove items indicated on Drawings; do not disturb items identified to remain in place.
- .2 Removal of Pavements, Curbs and Gutters:
 - .1 Square up adjacent surfaces to remain in place by saw cutting or other method approved by Consultant.
 - .2 Protect adjacent joints and load transfer devices.
 - .3 Protect underlying and adjacent granular materials where they are exposed and identified to remain.
 - .4 Prevent contamination with base course aggregates, when removing asphalt pavement for subsequent incorporation into hot mix asphalt concrete paving.
- .3 Excavate a minimum of 300 mm below pipe inverts, when removing pipes under existing or future pavement area.

- .4 Remove as many trees as required to complete demolition operations; prevent damage to trees identified to remain; obtain written permission from Consultant prior to removal of trees not identified on Drawings:
 - .1 Sell or donate trees identified for removal and that are healthy and marketable; remove trees that are not healthy or marketable using alternate disposal methods.
 - .2 Grind, chip, or shred other vegetation for mulching and composting.
- .5 Stockpile topsoil for final grading and landscaping; provide erosion control and seeding if not immediately used.
- .6 Dispose of materials not identified for salvage or re-use on site at certified landfill site or recycling facility as indicated in Section 01 74 19 – Construction Waste Management.

3.3 RESTORATION

- .1 Restore areas and existing works outside areas of demolition to conditions that existed prior to beginning of Work.
- .2 Use soil treatments and procedures that are not harmful to health, are not injurious to plants, and do not endanger wildlife, adjacent watercourses or ground water.

3.4 CLEANING

- .1 Remove debris, trim surfaces and leave work site clean, upon completion of Work.
- .2 Use cleaning solutions and procedures that are not harmful to health, are not injurious to plants, and do not endanger wildlife, adjacent watercourses or ground water.

END OF SECTION

Part 1 General

1.1 PRICE AND PAYMENT

- .1 Removal of existing asphalt pavement will be measured in square metres of surface actually removed regardless of depth removed.
- .2 Payment under this item will include operations involved in removing, hauling and stockpiling designated pavement and cleaning of remaining pavement surface.

1.2 ADMINISTRATIVE REQUIREMENTS

- .1 Coordination:
 - .1 Divert excess materials from landfill
 - .2 Separate materials identified for recycling place in identified areas in accordance with Waste Management Plan
 - .3 Label location of salvaged material's storage areas and provide barriers and security devices
 - .4 Remove materials that cannot be salvaged for re use or recycling and dispose of in accordance with applicable codes at licensed facilities
- .2 Pre Construction Meeting: Arrange a pre construction meeting attended by Contractor's key personnel and Consultant to discuss the following:
 - .1 Verify project requirements.
 - .2 Review site conditions.
 - .3 Coordination with other Subcontractor's affected by work of this Section.
 - .4 Examine existing site conditions adjacent to demolition work, prior to start of Work.
 - .5 Waste reporting requirements.

1.3 ACTION AND INFORMATIONAL SUBMITTALS

- .1 Action Submittals: Provide following submittals before starting work of this Section:
 - .1 Shop Drawings: Submit shop drawings indicating diagrams or details showing sequence of demolition work.
- .2 Informational Submittals: Provide following submittals during course of work:
 - .1 Certificates: Submit copies of certified weigh bills, bills of lading or receipts from authorized disposal sites and re use and recycling facilities for material removed from site on weekly basis.

1.4 QUALITY ASSURANCE

- .1 Regulatory Requirements: ensure Work is performed in compliance with applicable Provincial regulations.
- .2 Comply with hauling and disposal regulations of Authority Having Jurisdiction.

1.5 SITE CONDITIONS

- .1 Protect existing site features to remain or identified for salvage or re use; make repairs and restore to a similar condition to existing where damage to these items occurs as directed by Consultant and at no cost to Owner:
 - .1 Remove and store salvaged materials to prevent contamination.
 - .2 Store and protect salvaged materials as required for maximum preservation of material.
 - .3 Handle salvaged materials same as new materials.
- .2 Perform pavement removal work to prevent adverse effects to adjacent watercourses, groundwater and wildlife, and to prevent excess air and noise pollution:
 - .1 Do not pump water containing suspended materials into watercourses, storm or sanitary sewers or onto adjacent properties.
 - .2 Control disposal or runoff of water containing suspended materials or other harmful substances in accordance with Authorities Having Jurisdiction.
- .3 Protect existing site features and structures, trees, plants and foliage on site and adjacent properties.

Part 2 Products

2.1 EQUIPMENT

- .1 Use cold milling, planning or grinding equipment with automatic grade controls capable of operating from stringline, and capable of removing part of pavement surface to depths or grades indicated.

Part 3 Execution

3.1 PREPARATION

- .1 Verify extent and location of asphalt identified for removal, disposal, alternative disposal, recycling, salvage and items to remain.
- .2 Locate and protect utilities, preserve active utilities traversing site in operating condition.
- .3 Temporary Erosion and Sedimentation Control:
 - .1 Provide temporary erosion and sedimentation control measures to prevent soil erosion and discharge of soil-bearing water runoff or airborne dust to adjacent properties and walkways, according to TRCA requirements and sediment and erosion control drawings, compliance to EPA 832/R-92-005, whichever is more stringent.
 - .2 Inspect, repair, and maintain erosion and sedimentation control measures during construction until permanent vegetation has been established.
 - .3 Remove erosion and sedimentation controls and restore and stabilize areas disturbed during removal.

- .4 Prior to beginning removal operation, inspect and verify with Consultant areas, depths and lines of asphalt pavement to be removed.
- .5 Protection: protect existing pavement not designated for removal, light units and structures from damage. In event of damage, immediately replace or make repairs to approval of Consultant at no additional cost.

3.2 REMOVAL

- .1 Remove existing asphalt pavement to lines and grades as indicated and established by Consultant on site.
- .2 Demolition of pavements, curbs and gutters:
 - .1 Square up adjacent surfaces to remain in place by saw cutting or other method acceptable to Consultant on site.
 - .2 Protect adjacent joints and load transfer devices.
 - .3 Protect underlying and adjacent granular materials where they are exposed and identified to remain.
 - .4 Prevent contamination with base course aggregates, when removing asphalt pavement for subsequent incorporation into hot mix asphalt concrete paving.
- .3 Use equipment and methods of removal and hauling which do not damage or disturb underlying pavement.
- .4 Prevent contamination of removed asphalt pavement by topsoil, underlying gravel or other materials.
- .5 Suppress dust generated by removal process.

3.3 FINISH TOLERANCES

- .1 Finished surfaces in areas where asphalt pavement has been removed within +/- 5 mm of grade specified but not uniformly high or low.

3.4 CLEANING

- .1 Progress Cleaning:
 - .1 Leave Work area clean at end of each day.
- .2 Final Cleaning: upon completion remove surplus materials, rubbish, tools and equipment.
- .3 Sweep remaining asphalt pavement surfaces clean of debris resulting from removal operations using rotary power brooms and hand brooming as required.

END OF SECTION

PART 1 General

1.1 DEFINITIONS

- .1 The following Definitions shall apply in this Specification:
- .2 Contract Documents
 - .1 The Contract Documents consist of the Drawings, Specifications and Reports which form part of the agreed Contract.
- .3 Consultant
 - .1 The Consultant is the Architect, SEOR, persons or entities engaged by the Owner. The term Consultant means the Consultant or the Consultant's authorized representative.
- .4 Contractor
 - .1 The term Contractor is defined to include any of the following: Construction Manager, General Contractor, Structural Steel Erector, Structural Steel Fabricator, Subcontractor or Supplier.
- .5 Owner
 - .1 The Owner is the person or entity identified as such in the Contract. The term Owner means the Owner or the Owner's authorized agent or representative but does not include the Consultant.
- .6 SEOR
 - .1 The SEOR is defined as the Structural Engineer of Record for the Contract.

1.2 WORK INCLUDED

- .1 Comply with Division 1, General Requirements and documents referred to therein.
- .2 Spec. Note: Ensure that under "GENERAL REQUIREMENTS" (Division 1) or "SUBMITTALS" (Section 01300) the Architect has included a clause indicating that the Contractor is solely responsible for the preparation of Shop Drawings and that the Consultant reviews them only for "General Conformance" to the Contract Document.
- .3 Provide labour, materials, products, equipment and services required to complete the demolition work.
- .4 Schedule of Structure to Be Demolished
- .5 Also, refer to drawings for location of building and extent of demolition work.

1.3 RELATED WORK SPECIFIED ELSEWHERE

- .1 Structural Alterations: Section 02 20 10

1.4 REFERENCE STANDARDS, CODES AND ACTS

- .1 Conform to Ontario Regulation 332/12 The Building Code as amended by all subsequent Ontario Regulations issued to the date of these terms of reference and applicable acts of authorities having jurisdiction.

1.5 PERMITS AND REGULATIONS

- .1 Arrange and pay for all permits, notices, and inspections necessary for the proper execution and completion of the demolition work, except for the demolition permit which shall be obtained and paid for by the Owner or by his authorized representative.
- .2 Engage the services of a Professional Engineer licensed in [the Province of Ontario] to provide supervision during demolition and to prepare and submit the required documents to the municipal authorities at completion of Work. Submit a copy of the documents to the Owner and the Architect.

Part 2 Products

2.1 SALVAGE AND DISPOSAL OF MATERIALS

- .1 All materials from the demolition, except as specified below or otherwise directed, shall become the property of the Contractor. Remove all material and debris from the site as quickly as possible and dispose of legally. Burning of debris or selling of materials on the site will not be permitted.
- .2 Salvage materials and/or equipment to be turned over to the Owner as directed by the Consultant. Remove carefully the following items to be salvaged, protect during demolition, and place in locations designated:

Part 3 Execution

3.1 PROTECTION

- .1 Supply, install, and maintain temporary hoardings and sidewalk covers, including lighting if required, in compliance with requirements of authorities having jurisdiction, and to the approval of the Owner, to provide a smooth, continuous exterior surface in one plane, unbroken by supports, perforations or other structural members. Remove hoardings at completion of work of this Section as and when directed by the Owner.
- .2 Provide barricades and guard rails as required to give full protection to the general public, to workmen employed on the demolition and to adjoining properties.
- .3 Protect adjacent properties against damages which might occur from falling debris or other causes; do not interfere with use or occupancy of adjacent buildings; maintain free, safe passage to and from same.
- .4 Take precautions to guard against movement or settlement of existing structures to remain, adjacent land, buildings, and paving. If at any time the safety of such land, buildings, or pavements appears to be in danger, suspend operations and notify the Consultant promptly. Take measures to support such land, buildings, and pavements. Do not resume demolition until the Consultant permits.

- .5 Do not place nor store material in streets, lanes, or passageways, except as permitted by authorities having jurisdiction.
- .6 Do not restrict traffic on public streets, lanes, and sidewalks except as permitted by authorities having jurisdiction.
- .7 Do not commence demolition of buildings until all personnel and Owner's equipment are removed from the buildings except such equipment listed below to be removed by the Contractor and turned over to the Owner.
- .8 Drain fuel tanks and remove the fuel from the site in an acceptable manner prior to start of demolition work.

3.2 EXISTING SERVICES

- .1 Arrange and pay for the disconnection, capping, and plugging of gas, water, sewer, electric, telephone, and other services to the structures to be demolished. In advance, notify each utility company involved and obtain approval before commencing that portion of the work. Disconnect and cap services at the property line.
- .2 Make good to the requirements of the local authorities public roads, walkways and curbs soiled or damaged due to work of this Section.

3.3 DEMOLITION

- .1 Refer to the Schedule specified herein and to the drawings for extent of demolition work.
- .2 Carry out demolition in strict accordance with requirements of authorities having jurisdiction.
- .3 At end of each workshift leave work in a safe condition so that no part of the remaining structure is in danger of toppling, collapsing, or falling.
- .4 During demolition operations, keep work wetted down thoroughly to prevent dust and dirt from rising. Provide waterline for this purpose. Furnish connections that may be required and pay for cost of water used. Upon completion, remove installed temporary waterline.
- .5 Demolish the portion of building noted including removal of roofs, walls, floors, paving, foundation walls, drains and other piping.
- .6 Collapse enclosed spaces existing below grade, if any.
- .7 Remove combustible materials, plastics, metal, glass, wood, and other organic material from site.
- .8 Break up and remove existing slabs on grade.
- .9 Remove from the site all pieces of concrete weighing more than 900 kg (2000 lbs) or larger than 0.5 m³ (½ yd³) whichever is the more restrictive, or break into small pieces.
- .10 Remove fuel tanks from the site.

- .11 Fill excavated areas, voids, and depressions below grade at areas of demolished structure (outside new basement walls) with clean rubble containing only whole or broken masonry units, mortar, stone, small pieces of concrete, gravel, sand, or crushed stone. Remove all combustible materials, metal, glass, and wood or other organic material from backfill material.
- .12 On completion, grade and level the finished site around remaining structure, sloped to drain away from remaining structure and in manner to prevent puddles, flush with adjacent grades, adding clean granular fill as required.

3.4 NOTIFICATION

- .1 Prior to commencing significant segments of the work, give the Consultant and Independent Inspection and Testing Companies appropriate notification so as to afford them reasonable opportunity to review the work. Failure to meet this requirement may be cause for the Consultant to classify the work as defective.

END OF SECTION 02 41 19

Part 1 General

1.1 SECTION INCLUDES

- .1 Removal and disposal of impacted soil present in the vicinity of the existing inground bus lift hoists.

1.2 RELATED REQUIREMENTS

- .1 Section 31 23 33 – Excavation, Trenching, and Backfilling

1.3 ADMINISTRATIVE REQUIREMENTS

- .1 Comply with all applicable legislation and by-laws, including, but not limited to:
 - .1 Treatment and Disposal of Petroleum Contaminated Soil, June 2016
 - .2 Contaminated Sites Remediation Act (CSRA), April 2014.
- .2 Coordination
 - .1 The Contractor shall coordinate with all regulatory agencies having authority and scheduling for delivery of materials to the Provincial approved treatment/disposal facility.
 - .2 The Contractor shall notify the Contract Administrator within two (2) hours upon discovery of any petroleum contaminated materials.
 - .3 The Contractor shall provide at least two (2) working days' notice to the Project Administrator prior to the removal of any contaminated soil.

1.4 GENERAL

- .1 Excavation, transportation, and disposal, at a Ontario Sustainable Development approved facility, of contaminated soil, debris, concrete, and stone, containing gasoline, fuel oil, and lube oil range hydrocarbons as confirmed by on-site inspection and testing.
- .2 Segregation and stockpiling of clean overburden material, if present, for potential re-use as backfill.
- .3 Containment, transportation, and disposal, by a licensed disposal contractor, of any free phase petroleum product, as directed by the Contract Administrator.
- .4 Containment, treatment, and disposal of all groundwater in excavations, all run-off entering the excavations and wash water generated during the excavation of soils as agreed to by the Contract Administrator and regulatory authorities.
- .5 Coordination with all regulatory agencies having authority and scheduling for delivery of materials to the Provincial approved treatment/disposal facility.

1.5 REMOVAL

- .1 The Contract Administrator or his representative will oversee contaminated material removal activities and will make decisions as to the extent of contaminated material removed.

The Contract Administrator will provide instructions as to the method and type of record keeping required for documenting quantities of contaminated soil to be transported off- site for disposal.

- .1 Make submittals of documents in accordance with Section 01 33 00 - Submittal Procedures.

- .2 Locate and protect adjacent structures and foundations, trees, lawns, fencing, service poles, wires, utilities, paving, survey benchmarks, monitoring wells, and monuments not intended for removal which may be affected by the Work.
- .3 Notify all regulatory agencies having authority, as required.
- .4 All excavations are to remain within the established site property boundaries.
- .5 The vertical and lateral limits of the excavations will be based on area required for the completion of work.

1.6 CONTAINMENT OF MATERIAL ON SITE

- .1 All groundwater in excavations, all run-off entering the excavations of impacted soil and wash water generated during the excavation of impacted soils, will be temporarily stored on-site in spill-proof and leak-proof containers, as approved by the Contract Administrator, prior to their disposal. All waters will be disposed based upon the Contractor's method, as approved by the Contract Administrator, following receipt of analytical results. The Contractor shall be prepared to demonstrate that the treatment method is the most cost efficient. In addition, the Contract Administrator shall demonstrate that the methodology chosen has minimized the amount of impacted materials on the site.
- .2 Contractor shall cover contaminated soil stockpiles temporarily staged on the site at all times with PVC plastic or equivalent to prevent loss or erosion.
- .3 All free phase petroleum products will be contained in spill and leak proof containers, as approved by the Contract Administrator, prior to removal off-site for disposal.
- .4 All storage vessels for soils, product or groundwater must be readily accessible for sampling by the Contract Administrator. These vessels must have a means of securing access to prevent unauthorized and/or accidental entry into the vessels by trespassers.
- .5 All storage vessels for soils, product and groundwater must be readily accessible for clean-out prior to their removal from the site.

1.7 TESTING

- .1 All contaminant sampling and testing of soils and water will be carried out by the Contract Administrator. All other sampling and testing will be conducted by the Contractor at their expense.
- .2 Following completion of final soil testing, documentation shall be prepared by the Contract Administrator. Samples may require up to five (5) working days to receive analytical results; Contractor to schedule work to conform to this timing.
- .3 The Contract Administrator shall contact Regulatory Agency for agreement that contamination has been cleaned up.

1.8 PROTECTION

- .1 Prevent debris from blocking roads, ditches, and drains.
- .2 Ensure safe passage of persons around the excavation area.
- .3 Suppress dust and odours during excavation activities.

END OF SECTION

Part 1 General

1.1 UNIT PRICES

- .1 Provide unit price for excavation, remediation and disposal of contaminated soils in the event that they are encountered during removal of underground fire tank soil testing.
- .2 Unit prices will apply where more than 75 m³ of soil is required to be removed from boundary area around the fire tank; base contract shall account for this initial removal amount.

1.2 ACTION AND INFORMATIONAL SUBMITTALS

- .1 Provide required information in accordance with Section 01 33 00 - Submittal Procedures.
- .2 Submit a written report describing in detail procedures used to remove liquid from underground storage tank, cleaning and removing of underground storage tank, and disposal of liquid residues; provide verification that materials were disposed of in an environmentally responsible waste disposal facility; provide photographic documentation of work, including lab and field results, and receipts from disposal sites for tank and liquid residue.
- .3 Submit a written contingency plan for actions to be taken in the event of a release or emergency including:
 - .1 Emergency contact numbers;
 - .2 Classification of land use;
 - .3 Plans for covering/containing contaminated soil;
 - .4 Plans for site assessment/remediation work; and,
 - .5 Reducing risk to human health.

1.3 QUALITY ASSURANCE

- .1 Refer to laws, by laws, ordinances, rules, regulations and orders of authority having jurisdictions, and other legally enforceable requirements applicable to Work at that area; or become in force during Work performance.
- .2 Underground fire tank removal and disposal shall comply with requirements of authorities having jurisdiction.

1.4 PROJECT SITE CONDITIONS

- .1 Obtain necessary permissions and permits from Municipal Authorities where closure or obstruction of streets, sidewalks or driveways is required by work of this Section.

Part 2 Products

2.1 MATERIALS

- .1 Provide necessary materials, equipment and tarps to prevent further contamination of site, and for safe handling and containment of fuel, fuel storage and removed contaminated soils.

Part 3 Execution

3.1 PREPARATION

- .1 Provide all necessary personal protective equipment, purging and inert gases, and electrical protection equipment, and verify that equipment is working properly before starting work of this Section.

3.2 UNDERGROUND STORAGE TANK REMOVAL

- .1 Liquid Removal:
 - .1 Provide samples of liquids from underground fire storage tank to a certified hazardous waste testing facility for laboratory analysis and approval for liquid disposal and disposal location.
 - .2 Remove liquid from tank for disposal prior to removing tank from ground.
 - .3 Obtain disposal facility receipts noting proper liquid disposal.
- .2 Storage Tank Cleaning:
 - .1 Remove tank from ground, place it on ground adjacent to removal location, and secure it prior to cleaning.
 - .2 Measure levels of combustible vapours and oxygen, and ventilate tank if required to bring vapour or oxygen levels to safe limits:
 - .1 Ventilate tank using a small gas exhauster until vapour concentration is reduced to 10% or less of lower explosive limit.
 - .2 Oxygen content shall range from 19.5% to 23.5%.
 - .3 Cut access ports for cleaning into tank after vapour and oxygen concentrations are at a safe level.
 - .3 Clean tank by mopping, scraping, sweeping or steam cleaning interior of tank.
 - .4 Collect, contain and place residuals removed from tank in a 200 litre capacity drum for transporting and disposal acceptable to authorities having jurisdiction.
 - .5 Obtain disposal facility receipts noting proper effluent disposal.
- .3 Storage Tank Disposal:
 - .1 Verify that final vapour and oxygen concentrations are within requirements noted above before proceeding to cut and dismantle tank for its disposal.
 - .2 Remove dismantled tank to a disposal facility acceptable to authorities having jurisdiction.
 - .3 Obtain disposal facility receipts noting proper tank disposal.

3.3 REMOVED TANK AREA ASSESSMENT

- .1 Collect five soil samples from removed underground storage tank area as follows:
 - .1 One sample from each of sidewalls.
 - .2 One sample from base.
- .2 Place samples in glass sample jars and seal with Teflon coated lids, and place jar on ice.
- .3 Deliver samples with completed chain of custody documentation to laboratory.
- .4 Laboratory shall analyze each sample for Total Petroleum Hydrocarbon (TPH) concentrations.
- .5 Site Restoration: Refer to Section 31 23 33.01 - Excavating, Trenching and Backfilling for excavation, backfilling and compaction requirements for non contaminated remediation work.

3.4 CONTAMINATED SOIL REMEDIATION

- .1 Perform remediation work in accordance with Section 02 50 00 - Site Remediation
- .2 Collect additional soil samples beyond boundaries of original fire tank location. When soil assessments reveal evidence of leakage or spillage of hydrocarbons at levels above those established by authorities having jurisdiction relating to environmental management for underground storage tank closures.
- .3 Boundary of tank shall not to exceed 75 m³ of soil removed; work beyond this boundary will be considered as an extra to Contract and shall be based on unit pricing.
- .4 Continue soil removal and soil contamination assessment testing around tank until contamination levels are within acceptable levels.
- .5 Remove contaminated soil from site and haul it to an approved sanitary landfill for proper disposal.

END OF SECTION

Part 1 General

1.1 Definitions

- .1 The following Definitions shall apply in this Specification:
- .2 Contract Documents
 - .1 The Contract Documents consist of the Drawings, Specifications and Reports which form part of the agreed Contract.
- .3 Consultant
 - .1 The Consultant is the Architect, SEOR, persons or entities engaged by the Owner. The term Consultant means the Consultant or the Consultant's authorized representative.
- .4 Contractor
 - .1 The term Contractor is defined to include any of the following: Construction Manager, General Contractor, Structural Steel Erector, Structural Steel Fabricator, Subcontractor or Supplier.
- .5 Owner
 - .1 The Owner is the person or entity identified as such in the Contract. The term Owner means the Owner or the Owner's authorized agent or representative but does not include the Consultant.
- .6 SEOR
 - .1 The SEOR is defined as the Structural Engineer of Record for the Contract.

1.2 WORK INCLUDED

- .1 Comply with Division 1 - General Requirements and all documents referred to therein.
- .2 Provide all labour, materials, plant and equipment to complete the concrete formwork indicated in the Contract Documents, including the installation of cast in inserts and assemblies as therein.

1.3 RELATED WORK SPECIFIED ELSEWHERE

- .1 Concrete Reinforcement, Section 03 20 00
- .2 Cast-in-Place Concrete, Section 03 30 00
- .3 Structural Steel, Section 05 12 00, For anchor assemblies, bolts and the like to be cast into concrete.

1.4 REFERENCE STANDARDS, CODES AND ACTS

- .1 Conform to the requirements of the local building code identified on the Structural General Notes as amended by all subsequent Regulations issued to the date of this specification and applicable acts of authorities having jurisdiction.

- .2 All references to the Standards and publications noted below shall be to the edition referenced in the local building code identified on the Structural General Notes, or to the edition referenced in the latest published editions or revisions of all Standards published by the Canadian Standards Association issued to the date of this Specification, whichever is the later edition or revision.
- .3 All references noted below, which are not referenced by the local building code or the Standards published by the Canadian Standards Association, shall be to the latest edition and revision published to the date of this Specification.
- .4 Standards and publications referenced by the Standards noted below shall apply even if they are not included in the list. Where such reference is made, it shall be to that latest edition and revision published to the date of this Specification.
 - .1 CSA A23.1/ CSA A23.2 - Concrete Materials and Methods of Concrete Construction/Test Methods and Standard Practices for Concrete
 - .2 CSA S413 - Parking Structures
 - .3 CSA O86 - Engineering Design in Wood
 - .4 CSA O121 - Douglas Fir Plywood
 - .5 CSA O151 - Canadian Softwood Plywood
 - .6 CSA O153 - Poplar Plywood
 - .7 CSA O437 Series - OSB and Waferboard
 - .8 CSA O325.0 - Construction Sheathing
 - .9 CSA S269.1 - Falsework and formwork
 - .10 CAN/CSA-S269.3 - Concrete Formwork
- .5 Where there are differences between the Contract Documents and the codes, standards or acts, the most stringent shall govern.

1.5 TOLERANCES

- .1 Perform forming operations and place hardware so that finished concrete will be within the tolerances set out in CSA A23.1.
 - .1 Variations in building lines which result in extension of the building over lot lines or restriction lines will not be permitted.
- .2 These tolerances are acceptable with regard to structural requirements. Interfacing tolerances may not be compatible with the above. Review and coordinate interfacing tolerances so that the various elements come together properly.

1.6 Qualifications

- .1 The formwork and reshoring shall be designed by a qualified professional engineer licensed by the authority having jurisdiction with a minimum of 5 years Canadian experience in the design of such temporary construction Work.

1.7 DESIGN

- .1 Formwork and Reshoring.
 - .1 The Contractor shall design formwork and reshoring to safely support vertical and lateral loads until they can be supported by the structure.
 - .2 Design formwork to the requirements of CAN/CSA S269.3.

1.8 SUBMITTALS

- .1 Shop Drawings for Formwork and Reshoring
 - .1 The structural Drawings shall not be reproduced, in whole or in part, for use as shop drawings.
 - .2 Provide adequate space on all shop drawings immediately above the drawing title block for the Consultant's Shop Drawing review stamp. Where requested by the Consultant, the stamp is to be inserted by this section directly into the shop drawing prior to submission. The stamp shall be positioned in the same location on each shop drawing, and in no case shall the allocated space be less than 63mm x 75mm. Request the details of these requirements from the Consultant no less than 2 weeks before the commencement of shop drawings.
 - .3 Well in advance of construction, submit to the Consultant shop drawings showing the complete design and detailing of the slab formwork and reshoring systems stamped by a qualified professional engineer licensed by the authority having jurisdiction.
 - .4 As a minimum, the shop drawings shall show the following:
 - .1 All design assumptions including references to the relevant codes, standards and sets, design loads, assumed concrete placing rate and the like.
 - .2 Layout of formwork panels and shores;
 - .3 Formwork details related to stripping and reshoring;
 - .4 Camber;
 - .5 Sequence for installing reshores;
 - .6 Stripping schedule;
 - .7 Number of slabs reshored at any given time;
 - .8 Method, sequence, and schedule of construction, materials, arrangement of joints, form ties, shores, liners and locations of temporary embedded parts in architectural form concrete elements; and
 - .9 Complete details associated with forming sloped slabs together with placing and compaction procedures for sloping slabs, including details of construction and placing of top forms.

- .5 Include in the shop drawing submission a method statement as to how the cambers specified in the Contract Documents will be achieved in the field.
- .2 Construction Joints
 - .1 Well in advance of construction, submit to the Consultant shop drawings showing the location of all horizontal and vertical construction joints in the structure. Drawings shall include plans, wall elevations and additional sections and details (as necessary) which clearly indicate the proposed location of the joints. Drawings shall include dimensions for all construction joints to reference grid lines and elevations.
 - .2 Drawings shall include any specific provisions or requirements where the elements are noted to be poured monolithically on the Contract Documents.
- .3 Surveys
 - .1 Submit surveys showing position of formwork, cast-in-place inserts and structural elements as noted below.
 - .2 As a minimum include the following:
 - .1 Elevation and location of centreline with respect to grids of all footings, caissons, piles;
 - .2 Location of centreline of all columns with respect to grids at each floor level;
 - .1 Before concrete placement.
 - .2 After concrete placement, prior to removal of any formwork and reshores from below.
 - .3 Location and alignment of edge of slabs with respect to grids at all floor levels;
 - .4 Location and elevation of cast-in-place hardware at all levels; and
 - .3 All surveys submitted must clearly indicate the date when the survey was carried out.
- .4 As-Built Drawings
 - .1 Mark on a complete set of final drawings any changes, additions or deletions that occur during construction as a result of the Contractor's Work, change orders, or for any other reason.
 - .2 For all shop drawings marked "Reviewed as Noted" or "Revise and Resubmit", update and submit a record set of these drawings at the completion of the structural Work. Ensure that these drawings reflect the changes and are coordinated with the final drawings noted above.

Part 2 Products

2.1 MATERIALS

- .1 Formwork
 - .1 Formwork lumber: Conform to O86.1 and CSA - O325.0.
 - .2 Sheathings for exposed surfaces: New, Douglas Fir plywood not less than 19 mm thick, concrete form grade, sanded one side, conforming to CSA-O325.0.
 - .3 Preformed Steel Forms: Minimum 1.6 mm or 16 gauge matched, tight fitting, stiffened to support weight of concrete without deflection detrimental to tolerances and appearance of finished surfaces.
 - .4 Void Forms: Moisture resistant treated paper faces, biodegradable, structurally sufficient to support weight of the wet concrete mix until initial set.
 - .5 Corners: Chamfered as required architecturally, in maximum lengths possible.
- .2 Waterstops
 - .1 Construction and Control Joints: Provide polyvinyl Chloride (PVC) waterstop Type 7 (internal type) or Base Seal Type 61 (external type) as manufactured by CPD Construction Products or an equivalent approved by the Consultant.
 - .3 Dovetail anchor slots: Minimum 0.8 mm thick (22 gauge) galvanized steel with insulation filled slots.
 - .4 Flashing Reglets: Minimum 0.8mm (22 gauge) thick galvanized steel with alignment splines for joints.
 - .5 Form Spacers: (Stay-in-place form spacers exposed to weather, earth, or moisture shall not be made of wood, and shall be corrosion and decay resistant.)

Part 3 Execution

3.1 CONCRETE WORK AT EXISTING STRUCTURE

- .1 Prior to undertaking any Work in or adjacent to the existing structure, verify that conditions are as indicated on the Contract Documents. If they are not, do not proceed until the Consultant has given instructions.
- .2 Protect and support existing services that may interfere with Work in the existing structure.

3.2 FORMWORK

- .1 General

- .1 Erect, support, brace, and maintain formwork to safely support vertical and lateral loads until they can be supported by the structure.
- .2 All formwork shall be inspected by the Contractor and the professional engineer responsible for its design, prior to the concrete pour to ensure that they have been erected in conformance with the formwork shop drawings.
- .3 Align joints in formwork and make water-tight. Keep form joints to a minimum.
- .4 Install void forms in accordance with manufacturer's recommendations. Protect forms from moisture or crushing prior to concreting.
- .2 Construction
 - .1 Form footing sides unless footings are shown to be placed against undisturbed soil.
 - .2 Mark building, grid or other lines on forms to permit the accurate positioning of dowels into concrete elements above and all other reinforcing steel.
 - .3 Construct templates and supports to rigidly fix reinforcing dowels in the forms prior to concreting.
 - .4 Set anchor rods, templates, steel connection units, hardware, and/or other inserts into the forms and secure them rigidly so that they do not become displaced during concreting.
 - .5 In the case of sloping slabs, employ suitable forming procedures compatible with the concrete placing and compaction techniques to ensure that completed concrete has the design characteristics specified in the Contract Documents, and in particular, to prevent movement of plastic concrete resulting in cracking, loss of bond, etc., and to achieve a surface equivalent to a fine wood float finish suitable to receive the roofing membrane.
 - .6 Application of Form Release Agent
 - .1 Apply form release agent in accordance with the manufacturer's recommendations.
 - .2 Apply prior to placement of reinforcement, anchoring devices, and embedded items.
 - .3 Do not apply form release agent where concrete surfaces will receive special finishes or applied coverings, which are affected by the agent. Soak inside surface of untreated forms with clean water and keep surfaces covered prior to placement of concrete
- .3 Sleeves, Recesses and Formed Openings

- .1 Form sleeves, recesses and openings in accordance with reviewed sleeving drawings, except where such items are specified to be formed or sleeved by the appropriate Section in the Contract Documents.
- .2 No sleeves, recesses, or openings through structural members shall be formed without the Consultant's approval.
- .3 During cold weather, protect members from damage due to water freezing in confined areas, recesses, sleeves or formed 'openings'.

3.3 STRIPPING OF FORMS AND RESHORING

- .1 Where forms are stripped from horizontal or sloping members before concrete has reached its specified strength, reshore the members so that they can safely support their own load plus construction loads. In addition, ensure that the stripped member is of sufficient strength to safely carry its own weight over the area stripped out at any instant, together with any superimposed construction loads.
 - .1 Install reshores so that they are supported on members which can safely support the reshore load.
 - .2 As a guide, under the curing conditions specified in the Contract Documents, 70% of the 28 day strength should be attained 7 days after concreting in normal weather and 14 days after concreting in "Cold Weather".
 - .3 Base decision to strip forms upon satisfactory results of 7 day concrete cylinder tests and on Site curing conditions or on in situ tests.
 - .4 Stripping and reshoring shall proceed simultaneously so as not to leave an area greater than 80 sq. m. unsupported by either formwork or reshoring at any instant. Install reshores tight to construction above and below so that they will not significantly shorten under load, but take care not to preload the construction below or raise the construction above by over-tightening.
 - .5 Maintain reshoring or formwork in place for a minimum of 28 days or for such longer time as may be required to ensure that the concrete has reached its specified 28 day strength.
 - .6 Do not strip within one and a half bays of a construction joint until new concrete beyond the construction joint has reached 70% of its specified 28 day strength.
 - .7 Side forms for vertical members may be stripped as soon as the concrete is sufficiently strong to stand unsupported and safely resist imposed loads.
 - .8 Prior to pouring the concrete elements directly supported above, remove sonotube forms to such an extent to allow the Consultant to review the quality of any exposed column surface. Provide necessary protection to the exposed surfaces upon completion of review.

3.4 CONSTRUCTION JOINTS

- .1 Obtain approval from the Consultant for location and details of construction joints not shown on the Contract Documents.

3.5 WATERSTOPS

- .1 Install waterstops in accordance with the manufacturer's requirements, to provide continuous water seal. Do not distort or pierce waterstop. Do not displace reinforcement when installing waterstops. Tie waterstops rigidly in place.
- .2 Splice waterstops in accordance with the manufacturer's requirements.
- .3 Where waterstops are noted to be installed adjacent to existing Work, prepare existing surfaces to receive waterstop in accordance with manufacturer's recommendations.

3.6 QUALITY CONTROL

- .1 Implement a system of quality control to ensure that the minimum standards specified in the Contract Documents are attained.
- .2 Bring to the attention of the Consultant any defects in the Work or departures from the Contract Documents which may occur during construction. The Consultant will decide upon corrective action and give recommendations in writing.
- .3 The Consultant's general review during construction and inspection and testing by independent inspection and testing companies reporting to the Consultant are both undertaken to inform the Owner of the Contractor's performance and shall in no way augment the Contractor's quality control or relieve the Contractor of its contractual responsibility.

3.7 NOTIFICATION

- .1 Prior to commencing significant segments of the Work, give the Consultant and independent inspection and testing companies appropriate notification so as to afford them reasonable opportunity to review the Work. Failure to meet this requirement may be cause for the Consultant to classify the Work as defective.

3.8 INSPECTION AND TESTING

- .1 The Owner or Consultant will appoint an independent inspection and testing companies to make inspections or perform tests as the Consultant directs. The independent inspection and testing companies shall be responsible only to the Consultant, and shall make only such inspections or tests as the Consultant may direct.

3.9 DEFECTIVE MATERIALS AND WORK

- .1 Where evidence exists that defective Work has occurred or that Work has been carried out incorporating defective materials, the Consultant may have tests, inspections or surveys performed, analytical calculations of structural strength,

made and the like, in order to help determine whether the Work must be corrected or replaced. Tests, inspections or surveys or calculations carried out under these circumstances will be made at the Contractor's expense, regardless of their results, which may be such that, in the Consultant's opinion, the Work may be acceptable.

- .2 All testing shall be conducted in accordance with the requirements of the Building Code, except where this would, in the Consultant's opinion, cause undue delay or give results not representative of the rejected material in place. In this case, the tests shall be conducted in accordance with the standards given by the Consultant.
- .3 Materials or Work which fail to meet the requirements Specified in the Contract Documents may be rejected by the Consultant whenever found at any time prior to the Total Performance of the Work regardless of previous inspection. If rejected, defective materials or Work shall be promptly removed and replaced or repaired to the satisfaction of the Consultant, at no expense to the Owner.

END OF SECTION 03 10 00

Part 1 General

1.1 DEFINITIONS

- .1 The following Definitions shall apply in this Specification
- .2 Contract Documents
 - .1 The Contract Documents consist of the Drawings, Specifications and Reports which form part of the agreed Contract.
- .3 Consultant
 - .1 The Consultant is the Architect, SER, persons or entities engaged by the Owner. The term Consultant means the Consultant or the Consultant's authorized representative.
- .4 Contractor
 - .1 The term Contractor is defined to include any of the following: Construction Manager, General Contractor, Structural Steel Erector, Structural Steel Fabricator, Subcontractor or Supplier.
- .5 Owner
 - .1 The Owner is the person or entity identified as such in the Contract. The term Owner means the Owner or the Owner's authorized agent or representative, but does not include the Consultant.

1.2 WORK INCLUDED

- .1 Comply with Division 1 - General Requirements and all documents referred to therein.
- .2 Provide all labour, materials, plant and equipment to complete the steel reinforcement Work indicated in the Contract Documents and specified in this Section.

1.3 RELATED SECTIONS

- .1 Concrete Formwork, Section 03 10 00
- .2 Cast-in-Place Concrete, Section 03 30 00

1.4 REFERENCE STANDARDS, CODES AND ACTS

- .1 Conform to the requirements of the local building code identified on the Structural General Notes as amended by all subsequent Regulations issued to the date of this Specification and applicable acts of authorities having jurisdiction.
- .2 All references to the Standards and publications noted below shall be to the edition referenced in the local building code identified on the Structural General Notes, or to the edition referenced in the latest published editions or revisions of all Standards published by the Canadian Standards Association issued to the date of this Specification, whichever is the later edition or revision.

- .3 All references noted below, which are not referenced by the local building code or the Standards published by the Canadian Standards Association, shall be to the latest edition and revision published to the date of this Specification.
- .4 Standards and publications referenced by the Standards noted below are to apply even if they are not included in the list. Where such reference is made, it shall be to that latest edition and revision published to the date of this Specification.
 - .1 ASTM A82/A82M - Steel Wire, Plain, for Concrete Reinforcement.
 - .2 ASTM A123/A123M - Zinc (Hot-Dip Galvanized) Coatings on Steel Products.
 - .3 ASTM A184/A184M - Fabricated Deformed Steel Bar Mats for Concrete Reinforcement.
 - .4 ASTM A185/A185M - Steel Welded Wire Reinforcement, Plain, for Concrete.
 - .5 ASTM A416/A416M - Steel Strand, Uncoated Seven-Wire for Prestressed Concrete.
 - .6 ASTM A496/A496M - Steel Wire, Deformed, for Concrete Reinforcement.
 - .7 ASTM A497/A497M - Steel Welded Wire Reinforcement, Deformed, for Concrete.
 - .8 ASTM A704/A704M - Welded Steel Plain Bar or Rod Mats for Concrete Reinforcement.
 - .9 ASTM A775/A775M - Epoxy-Coated Reinforcing Steel Bars.
 - .10 ASTM A884/A884M - Standard Specification for Epoxy – Coated Steel Wire and Welded Wire Fabric for Reinforcement.
 - .11 ASTM D3963/D3963M - Fabrication and Jobsite Handling of Epoxy-Coated Steel Reinforcing Bars.
 - .12 CSA A23.1/ CSA A23.2 - Concrete Materials and Methods of Concrete Construction/Test Methods and Standard Practices for Concrete
 - .13 CSA A23.3 - Design of Concrete Structures.
 - .14 CSA S304.1 - Design of Masonry Structures
 - .15 CSA A371 - Masonry Construction for Buildings
 - .16 CAN/CSA G30.18 - Carbon Steel Bars for Concrete Reinforcement.
 - .17 CAN/CSA G40.20/G40.21 - General Requirements for Rolled or Welded Structural Quality Steel/Structural Quality Steel.
 - .18 CSA S413 - Parking Structures
 - .19 CAN/CSA S806 - Design and Construction of Building Components with Fibre-Reinforced Polymers.

- .20 CSA W186 - Welding of Reinforcing Bars in Reinforced Concrete Construction.
- .21 RSIC (Reinforcing Steel Institute of Canada) – Manual of Standard Practice.
- .1 Where there are differences between the Contract Documents and the codes, standards, or acts, the most stringent shall govern.

1.5 QUALIFICATIONS

- .1 The Contractor shall ensure that those responsible for welding reinforcement shall be certified by the Canadian Welding Bureau under the requirements of W186.

1.6 SAMPLES AND ASSISTANCE

- .1 Supply samples of the following materials, the cost of which shall be paid for by the Contractor:
 - .2 Reinforcing steel designated by the Consultant from steel shipped to the site
 - .3 Mechanical splices designated by the Consultant
 - .4 Welded reinforcement splices designated by the Consultant
 - .5 Support accessories (chairs, bolsters, spacers) identified by the Consultant
 - .6 Replace samples removed from the Site as necessary
 - .7 Inform the Consultant when fabrication will be undertaken. Allow Consultant to access the fabricator's plant during fabrication process.

1.7 SUBMITTALS

- .1 Shop Drawings for Reinforcement
 - .1 The structural Drawings shall not be reproduced, in whole or in part, for use as shop drawings.
 - .2 Prepare reinforcement shop drawings and bar lists taking into account all openings and recesses shown on the architectural, structural, mechanical and electrical Drawings, and on the sleeving shop drawings prepared by all other Sections.
 - .3 Prepare shop drawings to a minimum scale of [1:50] or larger as deemed necessary by the Contractor. Shop drawings shall be clear and complete and shall allow placement of reinforcement without reference to the Contract Documents.
 - .4 Provide adequate space on all shop drawings immediately above the drawings title block for the Consultant's shop drawing review stamp. Where requested by the Consultant, the stamp is to be inserted by this section directly into the shop drawing prior to submission. The stamp shall be positioned in the same location on each shop drawing, and in no case shall the allocated space be less than

63 mm x 75 mm. Request the details of these requirements from the Consultant no less than 2 weeks before the commencement of shop drawings.

- .5 Detail reinforcement in accordance with the Contract Documents, CSA A23.1 and detailing standards in RSIC Manual of Standard Practice.
- .6 As a minimum, the shop drawings shall show the following:
 - .1 Bar sizes, spacing, lap lengths, location and quantities of reinforcement and welded wire fabric.
 - .2 Bar spacing requirements and provisions for spacers where required.
 - .3 Locations where reinforcement is considered to be bundled, as defined by CSA A23.1.
 - .4 Identification of each bar with a code mark corresponding to the bar lists.
 - .5 Detail sections to fully illustrate placement of concrete reinforcement at areas such as openings, change of levels, spandrel elements, stairs and wherever else required.
 - .6 Large scale detail concrete sections at areas of steel concentrations such as at intersections of beams and columns, column splices or wherever else required.
 - .7 Placing sequence for areas with multiple layers of reinforcement.
 - .8 Minimum clearances between reinforcement and minimum concrete cover.
 - .9 Location, number and type of support accessories, including support bars suitably sized and spaced to rigidly support the weight of reinforcement and imposed loads during construction. Where 10M top bars and welded wire fabric are shown in the Contract Documents, provide adequate supports to ensure that these bars are not bent or displaced prior to or during the concreting operation.
 - .10 Location and embedment of dowels.
 - .11 Location of joist reinforcement in masonry walls.
 - .12 The size, location, and elevation of mechanical splices, as well as required installation procedures.
 - .13 Large-scale detail masonry sections at areas of steel concentrations such as at intersections of walls, beams, and pilasters, pilaster splices, or wherever else required.

- .14 Detail sections to fully illustrate placement of masonry reinforcement at areas such as openings, masonry beams and lintels, and wherever else required.
- .7 Provide dowels for reinforced masonry walls (load bearing or non load bearing) from slabs and walls. Coordinate location of walls with architectural Drawings.
- .8 Submit code marks or symbols used on reinforcement of each manufacturer so that the Consultant may identify grades and sizes of reinforcement.
- .2 Certificates
 - .1 Reinforcement from Canadian Manufacture: Provide the Consultant with a certified copy of the mill test reports for reinforcing steel showing physical and chemical analysis. For weldable reinforcement, include verification of its weldability. Reports to be submitted a minimum of 4 weeks prior to commencing fabrication.
 - .2 Steel Fibres: Provide certification and test reports for each shipment of fibres. Reports to be submitted a minimum of 4 weeks prior to batching concrete.
- .3 As-Built Drawings
 - .1 Mark on a complete set of final drawings any changes, additions, or deletions that occur during construction as a result of the Contractor's Work, change orders, or for any other reason.
 - .2 For all shop drawings marked "Reviewed as Noted" or "Revise and Resubmit", update and submit a record set of these drawings at the completion of the structural Work. Ensure that these drawings reflect the changes and are coordinated with the final drawings noted above.

1.8 TOLERANCES

- .1 Perform fabrication and setting so that completed Work will be within the tolerances set out in CSA A23.1.
- .2 These tolerances are acceptable with regard to structural requirements. Interfacing tolerances may not be compatible with the above. Review and coordinate interfacing tolerances so that the various elements come together properly.

Part 2 Materials

2.1 REINFORCEMENT

- .1 Reinforcing Steel, Deformed: Canadian manufacture to CAN/CSA-G30.18, billet steel, Grade 400R regular bars, unfinished.
- .2 Welded Steel Wire Reinforcement, Plain: ASTM A185/A185M, in flat sheets, galvanized.

- .3 Epoxy Coated Reinforcement: To ASTM A775/A775M and D3963/D3963M.
- .4 High Strength Reinforcement: Williams Grade 150 ksi All-thread-Bar manufactured to ASTM A722/A722M

2.2 MECHANICAL SPLICES

- .1 Mechanical Tension Splices: Type 2 mechanical splices, per CSA A23.3, lenton couplers, complete with bar end protectors and coupler end protectors, as supplied by Erico Canada Inc or an equivalent approved by the Consultant.
- .2 Mechanical Compression Splices: BAR-LOCK mechanical coupler system manufactured by Dayton/Richmond Concrete Accessories, End-Bearing Compression Splice SPEED-SLEEVE as supplied by Erico Canada Inc or an equivalent approved by the Consultant.

2.3 ACCESSORIES

- .1 Minimum gauge as required for support of stability of steel reinforcement during reinforcement placement and concreting operation.
- .2 Chairs, Bolsters, Bar Supports, Spacers: Sized and shaped for strength and support of reinforcement during concrete placement conditions including load bearing pad on bottom to prevent vapour barrier puncture.
- .3 Special Chairs, Bolsters, Bar Supports, Spacers Adjacent to Weather Exposed Concrete Surfaces: Plastic coated steel type; size, and shape as required.
- .4 Special Bar Supports for Reinforced Soil/Rock: Use precast concrete supports for exposed concrete beams and soffits and concrete cast against soil/rock. Precast concrete supports shall be made of concrete quality, class and strength at least equal to that specified in the Contract Documents for the member in which they are used.

2.4 STEEL FIBRES

- .1 Steel fibres shall meet the requirements of ASTM A820/A820M Type 1, deformed fibres. Minimum ultimate tensile strength shall be 150,000 psi. Minimum aspect ratio shall be 80. Minimum fibre length shall be 2.36 inches. Maximum fibre diameter shall be 0.03 inches. Steel fibres shall be Dramix RC 80/60 BN as manufactured by Bekaert Corporation or an equivalent approved by the Consultant.
- .2 Steel fibre concrete shall be proportioned as required in ASTM C1116/C1116M, alternative 3, in consultation with fibre manufacturer based on the required concrete properties indicated on the Drawings and in the Specifications.

Part 3 Execution

3.1 FABRICATION

- .1 Fabricate reinforcement in accordance with:
 - .1 CSA A23.1.

- .2 RSIC - Reinforcing Steel Manual of Standard Practice.
- .3 CSA-W186 Welded reinforcement.
- .2 Epoxy Coated Reinforcement: Clean surfaces, weld and re-protect welded joint in accordance with CSA-A23.1 and manufacturer's written instructions.
- .3 Locate reinforcement splices not indicated on the Drawings, at point of minimum stress. Review location of splices with the Consultant. Stagger splices to minimize cross sectional area at any one point in beams and walls.
- .4 Unless noted otherwise in the Contract Documents, bend reinforcement once only and at room temperature of 18°C, do not straighten or rebend reinforcement and do not field bend reinforcement. Do not use bars with kinks or bends not shown on the Drawings. Replace bars which develop cracks or splits.
- .5 Fabrication of High Strength Reinforcement
 - .1 Williams All-Thread-Bars shall not be welded or subjected to the heat of a torch or used as an electrical ground. Field cutting shall be done with an abrasive wheel or band saw only.

3.2 PLACEMENT

- .1 Prior to placing concrete, place support and secure reinforcement against displacement to CSA 23.1 and as indicated on reviewed placing drawings.
- .2 Do not displace or damage vapour barrier during reinforcement placement.
- .3 Accommodate placement of formed openings.
- .4 Maintain concrete cover as noted on the Contract Documents.
- .5 Where continuous drop panels or slabs thickenings are noted on the Drawings, place bottom slab reinforcement in the bottom of the continuous drop panel or slab thickening, unless noted otherwise on the Drawings.
- .6 Provide splices only where shown on the Contract Documents or reviewed shop drawings. No other splices will be permitted without approval of the Consultant.
- .7 Securely tie every other cross over (intersection) of reinforcement in top and bottom layers.
- .8 Where slab reinforcement intersects column, beam, or wall reinforcement, securely tie slab reinforcement to the vertical reinforcement in the other elements.
- .9 Securely tie all reinforcing steel mats to adjacent top or bottom mats or mats at the same level. Provide "continuity bars" connecting top layers of reinforcing with bottom layers as per typical details.
- .10 Ensure all dowels and embedded members are securely tied to slab reinforcement.
- .11 Where concrete toppings and curbs are placed directly over bare concrete slab surfaces, provide continuity bars connecting topping or curb reinforcement to the

structural slab reinforcement. Install continuity bars at 2 metre centres minimum around the perimeter of toppings and at 2 metre centres along the length of curbs.

.12 Additional Requirements for Epoxy Coated Reinforcement

- .1 All systems for handling, transporting, and storing coated bars shall be such that the epoxy coating shall not be damaged. Do not drop or drag bars. Store on suitable non-metallic supports.
- .2 During and after the placement of coated bars, repair all damaged portions of the coating. Any damaged accessories shall also be repaired. The Consultant may require that damaged bars be replaced instead of repaired.
- .3 The cutting of coated bars by burning shall not be permitted.
- .4 Do not weld coated bars.
- .5 Lap ends and sides of welded wire fabric as noted on the Drawings, but in no case less than 300 mm.
- .6 Additional Requirements for Mechanical Splicing of Reinforcement
- .7 Tension Splices
- .8 Unless noted otherwise in the Contract Documents, mechanical tension splices shall develop 120% of the specified yield strength, but not less than 110% of the actual yield strength, of the reinforcement being spliced or of the smaller bar if the bars spliced are of different sizes.
- .9 In each concrete member, unless otherwise indicated in the Contract Documents, mechanical tension splices in adjacent bars shall be staggered by at least 750 mm.
- .10 Compression Splices
- .11 Non End-Bearing Mechanical Splices
- .12 Unless noted otherwise in the Contract Documents, mechanical compression splices shall develop 120% of the specified tensile yield strength, but not less than 110% of the actual tensile yield strength of the reinforcement being spliced or of the smaller bar, if the bars spliced are of different sizes.
- .13 In each concrete member, stagger splices of adjacent bars by at least 750 mm.
- .14 End-Bearing Splices
- .15 End bearing splices shall develop the ultimate compressive strength of the reinforcing bars spliced.
- .16 Accurately saw cut the end bearing surfaces of all bars to be spliced 90 degrees to the axis of the bar with a tolerance of 1.5 degrees.

- .17 In setting the bars, rotate until the angle between bearing surfaces is at a minimum, but not more than 3 degrees of full bearing.
- .18 In each concrete member, stagger splices in adjacent bars by 750 mm but not less than 20 bar diameters.
- .13 Take particular care not to damage form sheathing surfaces during installation of reinforcement.

3.3 QUALITY CONTROL

- .1 Provide a system of quality control to ensure that the minimum standards specified in the Contract Documents are attained.
- .2 Bring to the attention of the Consultant any defects in the Work or departures from the Contract Documents which may occur during Construction. The Consultant will decide upon corrective action and give recommendations in writing.
- .3 The Consultant's general review during construction and inspection and testing by the independent inspection and testing companies are both undertaken to inform the Owner of the Contractor's performance and shall in no way augment the Contractor's quality control or relieve the Contractor of its contractual responsibilities with respect to quality control
- .4 Prior to commencing significant segments of the Work, give the Consultant and independent inspection and testing companies appropriate notification so as to afford them reasonable opportunity to review the Work. Failure to meet this requirement may be cause for the Consultant to classify the Work as defective.

3.4 INSPECTION AND TESTING

- .1 The Owner or Consultant will appoint the independent inspection and testing companies to make inspections or perform tests as the Consultant directs. The independent inspection and testing companies shall be responsible only to the Consultant, and shall make only such inspections or tests as the Consultant may direct.
- .2 When defects are revealed, the Consultant may request, at the Contractor's expense, additional inspection or testing to ascertain the full extent of the defect.
- .3 Tests of reinforcing steel by independent inspection and testing companies.
 - .1 A series of specimens for each grade and size of reinforcing steel contained in any 100 tonnes and 10 tonnes for concrete reinforcement and masonry reinforcement respectively may be tested. A series of tests will include two bars for each test required of each size and grade of steel used. Reinforcing steel tests will be made in accordance with CSA Standards G30 Series.
 - .2 Nondestructive tests may be made on welded reinforcement.
 - .3 Tension tests to destruction may be performed on approximately 5% of mechanical splices.

3.5 DEFECTIVE MATERIALS AND WORK

- .1 Where evidence exists that defective Work exists or that Work has been carried out incorporating defective materials, the Consultant may have tests, inspections or surveys performed, analytical calculations of structural strength made, and the like, in order to help determine whether the Work must be replaced. Tests, inspections or surveys or calculations carried out under these circumstances will be made at the Contractor's expense, regardless of their results, which may be such that, in the Consultant's opinion, the Work may be acceptable.
- .2 All testing shall be conducted in accordance with the requirements of the Building Code, except where this would, in the Consultant's opinion, cause undue delay or give results not representative of the rejected material in place. In this case, the tests shall be conducted in accordance with the standards given by the Consultant.
- .3 Materials or Work which fails to meet the requirements specified in the Contract Documents may be rejected by the Consultant whenever found at any time prior to the Total Performance of the Work regardless of previous inspection. If rejected, defective materials or Work shall be promptly removed and replaced or repaired to the satisfaction of the Consultant, at no expense to the Owner.

END OF SECTION 03 20 00

Part 1 General

1.1 DEFINITIONS

- .1 The following Definitions shall apply in this Specification:
- .2 Contract Documents
 - .1 The Contract Documents consist of the Drawings, Specifications and Reports which form part of the agreed Contract.
- .3 Consultant
 - .1 The Consultant is the Architect, SER, persons or entities engaged by the Owner. The term Consultant means the Consultant or the Consultant's authorized representative.
- .4 Contractor
 - .1 The term Contractor is defined to include any of the following: Construction Manager, General Contractor, Structural Steel Erector, Structural Steel Fabricator, Subcontractor or Supplier.
- .5 Owner
 - .1 The Owner is the person or entity identified as such in the Contract. The term Owner means the Owner or the Owner's authorized agent or representative but does not include the Consultant.

1.2 WORK INCLUDED

- .1 Comply with Division 1 - General Requirements and all documents referred to therein.
- .2 Provide all labour, materials, plant and equipment to complete the cast-in-place concrete Work indicated on the Drawings and specified in this Section.

1.3 RELATED WORK SPECIFIED ELSEWHERE

- .1 Concrete Forming, Section 03 10 00
- .2 Concrete Reinforcement, Section 03 20 00
- .3 Structural Steel, Section 05 12 00
- .4 Spec. Note: Section 31 23 00 – Excavation and Fill is usually by other, verify with architect.
- .5 Excavation and Fill, Section 31 23 00, For fill under slab-on-grade including moisture barrier

1.4 REFERENCE STANDARDS, CODES AND ACTS

- .1 Conform to the requirements of the local building code identified on the Structural General Notes as amended by all subsequent Regulations issued to the date of this Specification and applicable acts of authorities having jurisdiction.

- .2 All references to the Standards and publications noted below shall be to the edition referenced in the local building code identified on the Structural General Notes, or to the edition referenced in the latest published editions or revisions of all Standards published by the Canadian Standards Association issued to the date of this Specification, whichever is the later edition or revision.
- .3 All references noted below, which are not referenced by the local building code or the Standards published by the Canadian Standards Association, shall be to the latest edition and revision published to the date of this Specification.
- .4 Standards and publications referenced by the Standards noted below are to apply even if they are not included in the list. Where such reference is made, it shall be to that latest edition and revision published to the date of this Specification.
 - .1 CSA A23.1/ CSA A23.2 - Concrete Materials and Methods of Concrete Construction/Test Methods and Standard Practices for Concrete
 - .2 CSA A23.3 - Design of Concrete Structures
 - .3 CSA A3000 - Cementitious Materials Compendium.
- .5 Where there are differences between the Specifications and Drawings and the codes, standards or acts, the most stringent shall govern.

1.5 TOLERANCES

- .1 Perform placing operations so that completed Work will be within the tolerances set out in CSA A23.1.
- .2 Variations in building lines which result in extension of the building over lot lines or restriction lines will not be permitted.
- .3 These tolerances are acceptable with regard to structural requirements. Interfacing tolerances may not be compatible with the above. Review and coordinate interfacing tolerances so that the various elements come together properly.

1.6 QUALIFICATIONS

- .1 The 'foreperson' or 'lead hand' supervising the placement, consolidation, finishing and curing of the concrete shall be certified under an industry recognized concrete finishing program, such as the ACI Concrete Flatwork Finisher/Technician Certification Program.
- .2 The concrete supplier shall be certified by the Ready Mixed Concrete Association of Ontario (RMCAO) and shall hold a current "Certificate of Ready Mixed (or Mobile Mix) Concrete Production Facilities" as issued by the RMCAO.
- .3 Where concrete toppings are specified in the Contract Documents, the Contractor shall ensure that the concrete flooring contractor assumes responsibility for all aspects of the topping construction. This will include, but is not limited to the base course or substrate preparation, review of concrete mix design, concrete supply, bonding agents, placing, finishing and curing etc.

1.7 CONCRETE MIX DESIGN

.1 Design of Concrete Mixes

- .1 Concrete mixes are to be designed in accordance with the Performance Alternative outlined in CSA A23.1. The mixes shall be designed such that they will be homogeneous, uniformly workable, readily placeable into corners and angles of forms and around reinforcement by the methods of placing and consolidation employed on the Work, but without permitting materials to segregate or without permitting excessive free water to collect on the surface. The concrete, when hardened, shall have the qualities specified in the Contract Documents and in the concrete mix design.
- .2 When designing the concrete mixes, the Contractor shall ensure that the supplier is cognizant of the curing requirements outlined in the Contract Documents and CSA A23.1. If a particular concrete mix requires curing in addition to that specified, the Contractor shall be responsible for providing this additional curing.
- .3 Specified Strength: As called for on Drawings. Where walls are integral with columns of different specified strengths, cast walls and columns with concrete of the higher specified strength.
- .4 Modulus of Elasticity (E): For each concrete mix design, the Modulus of Elasticity, shall not be less than $(3300\sqrt{f'_c} + 6900)(Y_c/2300)^{1.5}$ MPa.
- .5 Fly Ash: The use of fly ash in concrete that will be exposed to view or in concrete that will be exposed to freeze-thaw cycles or de-icing chemicals is subject to review and acceptance by the Consultant.
- .6 Use of calcium chloride shall not be permitted.
- .7 The Contractor shall coordinate the mix designs for suitability with concrete pumping.
- .8 The Contractor shall design concrete mixes so they maintain their workability based on assumed minimum discharge and placing rates.

1.8 SAMPLES AND ASSISTANCE

.1 Concrete Test Cylinders

- .1 Supply materials for concrete test cylinders, the cost of which shall be paid for by the Contractor.
- .2 Cooperate in the execution of the concrete quality testing program. Furnish concrete required, protect specimens against injury and loss, and assist in the sampling and storage of specimens, as required.
- .3 Sample concrete, cast cylinders and store in accordance with CSA A23.1 where directed by the Consultant.

- .4 For all concrete compressive strength tests, 100mm x 200mm cylinders shall be used.
- .5 In accordance with requirements of CSA A23.1, provide storage facilities with continuous power supply for a Site storage container for test cylinders.
- .6 Provide sufficient field curing storage facilities so that cylinders representing the various areas can be safely stored in locations representing the curing conditions for those areas. Move the field cured cylinder storage facilities from area to area as the Work progresses.
- .2 Pullout Tests
 - .1 If requested by the Consultant, install pullouts to the requirements of the inspection and testing company.
 - .2 Installation of pullouts shall comply with the requirements of ASTM C900 and ACI 228.1.
- .3 Maturity Tests
 - .1 If pull-out tests are required, maturity meters shall be used to determine when pullout tests can be made.
 - .2 Installation, equipment and procedures shall comply with ACI 228R.
- .4 Substrate (Soil/Rock) Inspection
 - .1 Assist the geotechnical Consultant in making their inspections or tests.

1.9 SUBMITTALS

- .1 Surveys
 - .1 Submit surveys in accordance with Section 03 10 00 - Concrete Forming
- .2 Certificates
 - .1 The Contractor shall ensure that the concrete supplier submits a current "Certificate of Ready Mixed (or Mobile Mix) Concrete Production Facilities," as issued by the RMCAO.
 - .2 Prior to beginning Work and when any change in materials or source of supply is proposed, provide the following certificates prepared by an independent inspection company;
 - .1 Certification that all raw materials used in the production of concrete proposed for the Work comply with the requirements of the Specifications and CSA A23.1.
 - .2 Certification that compressive strength, slump, entrained air content, and other specified properties will be met, using the proposed mixes.

- .3 Certification that classes of exposure C-1, A-1 and C-XL will meet the 56-day limits specified in CSA A23.1 for the rapid chloride permeability test, using the proposed mixes.
- .4 Certification that the chloride ion content in the concrete, before exposure, shall not exceed 0.06% by mass of the cementing materials.
- .3 The Contractor shall ensure that the concrete supplier submits representative chloride permeability test data distributed over a period of 56 days for concrete exposure classes C-1, A-1 and C-XL with and without calcium nitrite corrosion inhibitor or any other admixture containing ionic salts.
- .4 The Contractor shall ensure that the concrete supplier submits their most current "Concrete Mix Design Statistical Analysis" records for the proposed concrete plant. These records shall indicate the concrete supplier's average strength, standard deviation, coefficient of variation and target strength, as per the requirements of CSA-A23.1 and the RMCAO.
- .3 Concrete Mix Designs
 - .1 Well in advance of the supply of concrete to the project submit, using the standard RMCAO form for Concrete Mix Design Submissions, all concrete mix designs for review. The mix designs shall include, as a minimum the following information:
 - .1 Concrete strength;
 - .2 Exposure class;
 - .3 Water-cement ratio;
 - .4 Maximum aggregate size;
 - .5 Maximum SCM replacement;
 - .6 Additional durability and architectural requirements;
 - .7 Slump range;
 - .8 Plastic air range;
 - .9 Method of placement;
 - .10 Dosage of corrosion inhibitor;
 - .11 Class of HVSCM (1 or 2);
 - .12 Other specific information regarding the source and type of all materials being proposed;
 - .13 Source of Supplementary Cementing Materials (SCM's).
 - .14 Assumed minimum discharge and placing rates.

- .2 Describe in detail on the mix design summary, the location(s) where each mix is to be placed in the structure.
- .4 Concrete Quality Plan
 - .1 At least four weeks prior to the supply of concrete to the project, submit a complete "Concrete Quality Plan", in the format provided by the Ready Mixed Concrete Association of Ontario.
- .5 Sloped Concrete Slabs
 - .1 Well in advance of construction, submit complete details of placing and compaction procedures for sloping roofs, including details of construction and placing of top forms and top form panel.
- .6 Curing Procedures
 - .1 At least four weeks prior to implementation in the field, submit a detailed description of the procedures which will be employed to cure the structure.
 - .2 As a minimum, the procedures shall indicate:
 - .1 The method for protecting the concrete from evaporation of surface moisture from the fresh concrete;
 - .2 The type of curing method to be used;
 - .3 Details of how various surfaces will be cured (slabs, walls, columns, ramps etc.)
 - .4 How the surface will be kept moist, and the quality control requirements for keeping the surface moist;
 - .5 The time of initiation and duration of curing;
 - .6 Provisions to address potential problems such as high winds and hot and cold weather;
 - .7 The limitations of access, if any, to the surfaces being cured; and
 - .8 A Quality assurance/Quality control program detailing how the curing program will be implemented, monitored and documented.
 - .3 Submit a 300mm x 300mm sample of each type of material (absorptive mat, fabric, plastic film, waterproof paper etc.) which will be used to cure the concrete.

Part 2 Products

2.1 MATERIALS

- .1 Concrete: Normal density concrete with an air-dry density between 2350 and 2450 kg/m³. Conform to CSA A23.1.
- .2 Cement Type: GU General Use Portland Cement.

- .3 Supplementary Cementing Materials: Conform to CSA.A3001.
- .4 Water: Clean, potable and not detrimental to concrete.
- .5 Nominal Size of Coarse Aggregate: 20 mm, except as noted below.
 - .1 Use pea gravel (5 mm to 10 mm) where concentration of reinforcement requires the use of a smaller diameter aggregate.
 - .2 Use 10 mm (maximum) aggregate in toppings that are less than or equal to 75 mm in thickness, and 20 mm aggregate in toppings greater than 75 mm in thickness.
- .6 Admixtures: Conform to CSA A23.1.
 - .1 Corrosion Inhibitor Admixture: Calcium nitrite based corrosion inhibitor, such as "DCI" or "DCI(S)" by W.R. Grace & Co. (or approved equivalent), shall be added at the rate of 10.1 litres per cubic metre of concrete, to all concrete designated Exposure Class 'C-1', unless noted otherwise in the Contract Documents. The corrosion inhibitor shall contain 30 ± 3 percent of calcium nitrite by weight. The selection of "DCI" or "DCI(S)" (or approved equivalent) shall be as directed by the admixture supplier, based on anticipated placing and curing conditions and the specific concrete mix design selected.
- .7 Shrinkage Control Fibres: "Dramix" steel fibres by Bekaert or approved equivalent, 60/1.05.
- .8 Bonding Agent: Use Sika Sikdur 32 epoxy bonding agent for all bonded topping installations.
- .9 Curing Compound: Conform to CSA A23.1.
- .10 Grout Beneath Base Plates: Non-shrink flowable grout in-Pakt by King Construction Products or approved equivalent, having a compressive strength at 28 days of at least 35 MPa. Where grout is exposed to view or weather, use non-ferrous grout.
 - .1 High Strength Concrete
 - .2 Cement Type: General Use Portland Cement (Type GU) or Low Heat of Hydration Portland Cement (Type LH) meeting the requirements of Standard CSA-A3001A.
 - .3 Supplementary Cementing Materials (SCMs)
 - .4 It is anticipated that one or more supplementary cementing materials will have to be used in the concrete to produce a mix with acceptable fresh and hardened concrete properties and acceptable thermal characteristics during hardening. The materials shall be one or more of the following:
 - .5 Granulated blast furnace slag,
 - .6 Fly-ash,
 - .7 Silica fume.

- .8 Supplementary cementing materials fly-ash, granulated blast furnace slag or silica fume, shall comply with the requirements of Standard CSA A3000 Cementitious Materials Compendium.
- .9 The Contractor shall ensure that the supplier submits evidence satisfactory to the Owner to demonstrate that the storage and dispensing facilities for supplementary cementing materials do not have any deleterious effects on the materials themselves. These facilities will not expose these materials to such effects as the agglomeration or balling of particles or any separation or change in effective particle size of solids in slurries or to freezing and thawing or to excessive heat.
- .10 Aggregates
- .11 The concrete supplier shall demonstrate, by appropriate tests that the aggregates chosen have the potential to meet the design strength and Modulus of Elasticity requirements specified in this Section.
- .12 Coarse Aggregate: Crushed rock conforming in all respects to Standard CSA A23.1. The maximum size of the coarse aggregates shall be 20 mm but smaller maximum sizes may be used.
- .13 Fine Aggregate: Natural and conforming to CSA A23.1.
- .14 HVSCM Concrete
- .15 Cement Type: General Use Portland Cement (Type GU).
- .16 Compressive Strength: Achieved at [56] days.
- .17 Supplementary Cementing Materials (SCMs)
- .18 Supplementary cementing materials fly-ash, granulated blast furnace slag or silica fume, shall comply with the requirements of Standard CSA A23.1 and CSA A3001.
- .11 Water Storage Tanks/Water Tight Construction
 - .1 Cement: Type LH low heat of hydration Portland Cement in accordance with CSA A3000. Alternative use of supplementary cementing materials and chemical admixtures is subject to review by the Consultant.
 - .2 Air Entrainment: 6% plus or minus 1%
 - .3 Compressive Strength: 28 MPa (4 ksi) minimum at 28 days.
- .12 Unshrinkable Fill
 - .1 Cement type-General Use GU Portland
 - .2 Minimum 24 hour strength - 0.07 MPa
 - .3 Maximum 28 day strength - 0.4 MPa
 - .4 Class of exposure - Not Applicable
 - .5 Size of coarse aggregate - 20 mm to 40 mm

- .6 Slump at point of discharge - 150 mm to 200 mm
- .7 Calcium chloride or pozzolanic mineral admixtures shall not be used. Air entraining admixtures may be added if desired by the Contractor.
- .13 Sealant for Exposed Separation Strips, Construction Joints, and Temporary Opening Joints: Multi-Component Polyurethane 'Sikaflex 2C-SL' by Sika, or an equivalent approved by the Consultant.

Part 3 Execution

3.1 General

- .1 Ensure minimum concrete discharge and placing rates are maintained to avoid unexpected cold joints from forming in the structure.

3.2 FOOTINGS

- .1 During cold weather conditions, carefully protect footing bases from freezing.
- .2 Found footings on naturally consolidated undisturbed soil capable of safely supporting the allowable bearing capacity shown on the Drawings within acceptable limits of settlement.
- .3 Founding elevations shown in the Contract Documents are based upon the geotechnical investigation.
- .4 Founding elevations and allowable bearing capacities must be verified by the geotechnical Consultant before footing concrete is placed.
- .5 If, upon excavating to the elevations shown in the Contract Documents, the required bearing capacities are not achieved, or if they are achieved at a higher elevation, inform the Consultant who will provide instructions as to how to proceed.
- .6 Record actual footing founding elevations.
- .7 Construct footings in a particular area commencing from the lowest footing elevation and proceeding to the higher elevations.
- .8 Remove water, disturbed soil and foreign matter from footing excavations before placing concrete. Do not permit the soil at founding elevations to soften due to the presence of water in the excavations or construction activity.
- .9 Remove water, loose rock and foreign matter from footing excavations before placing concrete.
- .10 Provide a 75 mm skim slab beneath all footings, where identified in the geotechnical report. Skim slab shall be placed after all loose material, foreign matter and water has been removed from the excavation and after the geotechnical engineer has inspected the soil at the founding elevation.
- .11 During cold weather, prevent soil adjacent to and beneath all footings from freezing. Do not pour footings on frozen soil or soil which has been allowed to freeze. If the soil at founding elevations is frozen or was frozen and thawed,

remove affected material and found footings on unaffected soil with the required characteristics at no extra cost to the Owner.

- .12 During cold weather, prevent rock adjacent to and beneath all footings from freezing.
- .13 Where excavations for mechanical or electrical services, pits, adjacent foundations and the like encroach upon a 7 in 10 slope noted above between corners of footings and bottom corners of excavations, lower footings a suitable amount so as not to exceed the slope noted above at no extra cost to the Owner.

3.3 Foundation mat

- .1 Massive pours may set up temperature rises and gradients that may cause severe cracking and in extreme cases, loss of strength. Plan and carry out concreting operations, protect and cure the concrete so as to prevent these conditions from occurring.
- .2 Design mix and employ construction procedures in accordance with CSA A23.1 such that the maximum temperature in the concrete and the maximum temperature difference from interior of mass to outside face do not exceed those specified in CSA A23.1. Use insulation or other approved techniques to achieve this.
- .3 Determine maximum temperature of the concrete at the time of placing by estimating the temperature rise during concrete batching, placing, hydration and curing.
- .4 Conduct a mat concrete test pour using the proposed mix design. The Owners inspection and testing company will install and monitor thermocouples in both the test pour and the final pour and report the temperature results achieved. If the Owner has not appointed an inspection and testing company, the Contractor shall arrange for an inspection and testing company to complete this Work. The size of the test pour shall be representative of the volume of concrete to be placed, but in no case less than 2.5 m x 2.5 m x depth or thickness noted on the Drawings.
- .5 In addition to the other requirements of this and other related Specification Sections, adhere to the following:
 - .1 Maximum size of aggregate: 40 mm.
 - .2 Temperature of the concrete at the time of placing: between 7°C and 21°C (45°F and 70°F)
- .6 Just prior to placing, bring surfaces, upon or against which concrete will be placed, above the freezing point.
- .7 In the hot weather months, provide cooling to sub base as required to maintain the initial temperature gradients of the concrete per CSA A23.1.
- .8 Provide appropriate insulation and protection to the concrete surfaces for at least 7 consecutive days immediately after concrete placement.

- .9 Do not remove insulation and protection until the temperature between average ambient and 25mm-50mm below the top of concrete is within the ranges specified in CSA A23.1. The Owners inspection and testing company will install and monitor a system of thermocouples placed at or below the surface of the concrete to determine concrete temperature. Protect the thermocouples, wires, data logger and the like to ensure that it is not damaged during construction.
- .10 Employ necessary procedures to keep temperature differential within concrete to 20°C or less.
- .11 Place concrete in maximum 450 mm lifts and thoroughly vibrate each layer and extend vibration into lower layers.
- .12 Advance each layer at least 6 metres before starting next layer.

3.4 CONSTRUCTION JOINTS

- .1 Obtain approval from the Consultant for location and details of construction joints not shown on the structural Drawings.
- .2 Provided proper placing, curing and protection means and methods are employed by the Contractor, the maximum length/height of concrete pours shall be as follows
 - .1 The maximum length of a suspended concrete slab pour shall be 40 m.
 - .2 The maximum length of a concrete slab on steel deck pour shall be 30 m.
 - .3 The maximum length of a slab-on-grade pour shall be 30 m.
 - .4 The maximum length of a concrete foundation wall pour shall be 15 m.
 - .5 The maximum height of a concrete pour shall be 4.5 m.
- .3 If the construction joints (including joints around temporary openings) will be exposed in its permanent condition, such as in a Parking Garage, the joints must be caulked as outlined in this Specification.

3.5 SLABS-ON-GRADE

- .1 General
 - .1 Do not place concrete slab-on-grade until the specified sub-floor material has been placed, inspected and approved.
 - .2 Do not place concrete on a frozen sub-grade, or on one that contains frozen materials.
 - .3 Do not place concrete on a sub-grade that has been frozen and thawed until the sub-grade has been reviewed by the geotechnical Consultant and approved. If, in the geotechnical consultant's opinion, the safe bearing capacity of the sub-grade has been reduced to below 25 kPa, remove the affected materials and replace with compacted granular fill at no additional cost to the Owner.

- .4 Place clear crushed stone over the sub-base, to depths indicated in the Contract Documents. Thoroughly roll and consolidate to the lines and levels required, with a maximum surface variation of +/- 10mm.
- .5 Upon approval of the placement of the sub-floor material and setting of reinforcement, place and consolidate concrete and finish and cure as specified in this Section.
- .6 Place a bond breaker, minimum 1 layer of building paper between edges of slab-on-grade and abutting surfaces. Where slab-on-grade is exposed to de-icing chemicals, provide an approved sealant at the joint between the slab-on-grade and abutting surfaces.
- .7 Saw-cut slabs-on-grade as shown in the Contract Document, or to the Consultant's approval.
- .8 Carry out cutting in accordance with recommendations contained in CSA A23.1.
- .9 Mask edges of saw-cuts as required to prevent concrete floors from becoming stained.
- .10 Construction joints may be provided in slabs-on-grade so that pours on any one day may be kept to reasonable sizes. Locate construction joints to the Consultant's approval.

3.6 UNSHRINKABLE FILL

- .1 Unshrinkable fill is intended for use locally in place of granular backfill below slabs-on-grade or within excavations where compaction of granular material is difficult to achieve. It is not intended for use below footings or around foundation walls, tunnels, laterally loaded caissons, etc., where vertical and/or lateral structural bearing capacities are required. Obtain written approval from the Consultant prior to using unshrinkable fill.
- .2 The unshrinkable fill material shall flow into the excavation so that it fills the entire space. Care shall be taken to ensure that no air is entrapped beneath horizontal projections or in other locations within the excavation.
- .3 Where bracing, shoring and/or sheeting is used to support the sides of the excavation or to prevent movements that could damage other services or adjacent pavements, this support system shall be removed as backfilling proceeds.

3.7 CONCRETE WORK AT EXISTING STRUCTURE

- .1 Before proceeding with any Work in or adjacent to the existing structure, verify that conditions are as indicated on the Drawings. If they are not, advise the Consultant of discrepancies and do not proceed until the Consultant has given instructions.

- .2 Prior to proceeding with the Work, determine the exact founding elevations of existing footings adjacent to the new Work. Report these findings to the Consultant before proceeding further.
- .3 Install footings adjacent to these existing footings in the sequences indicated in the Contract Documents, and against undisturbed soil as shown in the Contract Documents, and so that the stability of the existing footings and existing slabs-on-grade are maintained at all times. Temporarily support existing foundations as required.
- .4 Where openings are shown to be cut into the existing structure in the Contract Documents, drill at corners and saw cut remainder such that saw cuts do not extend into structure to be retained. Overcutting may require major structural strengthening, the cost of which shall be borne by the Contractor.

3.8 SLOPING SLABS

- .1 In the case of sloping slabs, employ suitable concrete placing and compaction procedures to ensure that completed concrete has the specified design characteristics, and in particular, to prevent movement of plastic concrete resulting in cracking, loss of bond, etc. and to achieve a surface equivalent to a fine wood float finish suitable to receive the roofing membrane.

3.9 PLACING CONCRETE

- .1 Place all concrete in accordance with CSA A23.1, the concrete supplier's requirements and as specified in this Section.
- .2 Immediately before placing concrete, clean forms and reinforcement of foreign matter.
- .3 Discharge concrete into forms in accordance with the time frames specified in CSA A23.1.
- .4 Prior to pouring the concrete elements directly supported above, remove sonotube forms to such an extent to allow the Consultant to review the quality of any exposed column surface. Provide necessary protection to the exposed surfaces upon completion of review.
- .5 Place concrete on steel deck floors in a manner that avoids piling up of concrete. Do not drop concrete directly from buckets, but employ suitable means of distribution. Wet down deck during hot weather prior to concreting.
- .6 Remove concrete spilled onto forms around hoisting equipment before depositing concrete in these areas.
- .7 Pumping Concrete
 - .1 Pumping or pneumatic placing of concrete shall only be used if the velocity of discharge is reduced to a point where no separation or scattering of the concrete occurs, and the consistency of the mix has been designed to allow such a system with no adverse effects on the quality of concrete.

- .2 The shotcrete process shall be deemed as being in contravention of the above clause.
- .3 Excess grout or mortar used to lubricate pipelines, or washout water, must not be discharged into the forms.
- .8 Shotcrete
 - .1 The use of shotcrete to construct any part of the Work shall be at the sole discretion of the Consultant.

3.10 CURING CONCRETE

- .1 Cure all concrete in accordance with CSA A23.1, the concrete supplier's requirements and as specified in this Section.
- .2 HVSCM Concrete
- .3 Cure all HVSCM concrete in accordance with the requirements of CSA A23.1. Wet curing shall commence immediately after placement and finishing of concrete.
- .4 C-XL Concrete
 - .1 All C-XL (extended service life concrete) shall be wet cured at a temperature of at least 10°C for a period of seven consecutive days and for a time necessary to attain 70% of the specified compressive strength, whichever is greater. Wet curing shall commence immediately after placement and finishing of concrete.
- .5 Wet Curing
 - .1 Basic Curing Period - the concrete shall be protected from premature drying and extremes of temperatures, and shall be wet cured at a temperature of at least 10°C for a period of three (3) consecutive days. Wet curing shall commence immediately after placement and finishing of the concrete.
 - .2 Additional Curing for Durability - Immediately following the Basic Curing Period, continue to wet cure the concrete (at a minimum temperature of 10°C for an additional four (4) consecutive days or until the concrete reaches 70% of its 28 day compressive strength, whichever is greater.
 - .3 Wet curing is to be achieved using one or more of the techniques outlined in CSA A23.1.
 - .4 If an absorptive mat or fabric material is used, it is imperative that it be kept continuously wet, by means of sprinklers, soaker hoses, a layer of polyethylene sheeting above, or another acceptable means.
 - .5 The use of curing compounds shall not be permitted in these areas.

3.11 PROTECTION

- .1 Protect all concrete in accordance with CSA A23.1, the concrete supplier's requirements and as specified in this Section; to prevent freshly deposited concrete from adverse conditions such as high winds, precipitation, freezing, being exposed to abnormally high temperatures or temperature differentials, premature drying, and moisture loss, for a period of time necessary to develop the specified properties of the concrete.
- .2 Cold Weather Concreting
 - .1 Between the 15th of October of any year and the 15th of April of the following year, or when the temperature is at or below 5°C or anticipated to fall below 5°C within 24 hours of placing concrete, provide on hand and ready for use all equipment necessary for adequate cold weather protection and curing before concrete placement is begun.
 - .1 Contractor is to submit a detailed procedure for review and approval by the consultant team prior to any construction commencing that outlines the means and method for protection of concrete in cold weather conditions. At a minimum, the submittal should include proper material selection and concrete mix design for cold weather applications, subgrade and formwork preparation, temperature control before, during and after placement, curing and protection measures, quality control and testing measures and contingency measures.
 - .2 When fresh concrete is to be cast against existing concrete, prevent the loss of heat by extending the protection for the fresh concrete over the existing concrete.
 - .3 Insulate, or enclose within the protective housing, tie rods, reinforcement or metal which projects from the concrete being protected.
 - .4 Construct enclosures tight and safe for wind and snow loadings.
 - .5 Maintain housing, enclosures and supplementary heat in place for entire period of protection, except that sections may be temporarily removed as required to permit placing additional forms or concrete provided the uncovered concrete is not permitted to freeze. Make up time lost from the required period of protection at the required temperature before protection is discontinued and removed. Protection is not to be completely removed until the concrete has cooled to within the temperature differential limits specified in CSA A23.1.
 - .6 Locate heating units to avoid heating concrete locally or drying it excessively. Avoid high temperature and dry heating within enclosures.
 - .7 Take particular care to maintain edges and corners of concrete at the required temperature owing to their greater vulnerability to freezing.
 - .8 Provide sufficient insulation, and heat as necessary, to prevent freezing of frost susceptible soil which lies against structural elements; in particular

protect soil beneath footings and behind foundation walls until the building is completed.

.3 Hot Weather Concreting

.1 When the rate of moisture evaporation exceeds 0.5kg/m² per hour or when the temperature is greater than or equal to 27°C, employ the following measures in addition to the requirements of CSA A23.1:

- .1 Use ice as mixing water, or an approved equivalent temperature reducing or set retarding admixture to lower the concrete temperature.
- .2 Dispatch ready-mix trucks and organize Work to keep mixing time to a minimum. Minimize exposure of mixing trucks to the hot sun while waiting. Water shall be made available to spray the exterior of the drum while the truck is waiting to discharge its concrete.
- .3 Provide adequate personnel and organize Work to keep placing time to a minimum.
- .4 Place concrete in layers thin enough and areas small enough so that the time interval for placing is reduced and compaction will ensure complete union of adjacent portions.
- .5 With formed concrete, reliance shall not be placed on the forms alone to provide curing. Spray formwork with water to keep it tight and free from cracking.

.4 Protection of Completed Work

- .1 At all times during the Work, protect exposed concrete, exposed masonry and other exposed members from staining or becoming coated with concrete leakage due to continuing concreting operations. Members which become coated may be classed as defective by the Consultant.
- .2 Protect exposed members from staining due to rusting of reinforcement projecting beyond construction joints.
- .3 Take suitable measures to prevent spalling and cracking damage occurring to the structure due to water freezing in expansion joints, small holes, slots, depressions and take suitable measures to prevent damage occurring to foundations and the like due to frost action in the soil or backfill.
- .4 The application of de-icing salts on completed Work is not permitted.

3.12 TOPPINGS

- .1 General
- .2 Conform to CSA A23.1 and the requirements noted below, unless noted otherwise in the Contract Documents.

- .3 Set screeds and bulkheads rigidly and accurately to prevent displacement during concreting.
- .4 Special provisions for bonded and unbonded toppings:
- .5 The maximum pour size for bonded and unbonded toppings is to be limited to 100 m².
- .6 Maintain a one to one length to width aspect ratio for all pours, where extent and geometry of topping permits.
- .7 Toppings are to be poured in a “checker board” pattern to minimize the effects of shrinkage. Adjacent sections of topping shall be poured no sooner than 3 days after the adjoining section was poured.
- .8 Ensure temperature of base course is 10oC minimum prior to pouring toppings.
- .9 Provide hot and cold weather protection for toppings in accordance with CSA A23.1.
- .10 Monolithic Toppings
- .11 Monolithic toppings are constructed by applying a concrete mixture to a “freshly” poured base course that has lost all slump and bleed water, prior to its final set. Alternatively, monolithic toppings can be poured with the main base course to a final thickness equal to the thickness of the base course plus the thickness of the topping.
- .12 Where monolithic toppings are specified in the Contract Documents, place reinforcement and maintain cover requirements based on the thickness of the base slab only. Provide additional layer of reinforcement in monolithic toppings where noted on the Contract Documents.
- .13 Bonded Toppings
- .14 Bonded toppings are constructed by applying the topping mixture over a hardened concrete base to which a bonding agent has been applied. By definition, bonded toppings are designed to bond to the concrete base or an existing concrete surface.
- .15 Bond strength between topping and base course shall not be less than [0.90 MPa], per CSA A23.1.
- .16 Base Course Finishing and Preparation
- .17 Base courses which are to receive bonded toppings are to be finished by one of two of the following methods:
- .18 Rough broom finish (very rough finish – amplitude \pm 5mm).
- .19 Steel trowel finish.
- .20 When a rough broom finish is provided, the slab surface shall be cleaned by high-pressure water blasting to ensure all laitance, dirt, dust, construction debris and the like are removed prior to application of the bonding agent. The bonding

agent shall be applied in strict accordance with manufacturer's recommendations.

- .21 When a steel trowel finish is provided, the slab is to be roughened by means of shot blasting prior to the application of the bonding agent. Ensure all laitance, dirt, dust, construction debris and the like are removed immediately prior to the application of the bonding agent. Employ all necessary means to control dust and debris during shot blasting.
- .22 Placing and Finishing Toppings
- .23 Place and finish the toppings in accordance with CSA A23.1.
- .24 Curing
- .25 Continuously wet cure bonded toppings for a minimum of seven days.
- .26 Jointing
- .27 Bonded toppings do not require special provisions with respect to jointing provided all the provisions noted above are adhered to.
- .28 The location of joints in the topping shall match those in the base course.
- .29 Unbonded (Loose Laid) Toppings
- .30 Unbonded or loose laid toppings are constructed by applying the topping mixture over a bond breaker and hardened concrete base, to which no bonding agent has been applied. By definition, unbonded toppings are specifically designed so as not to bond to the concrete base.
- .31 Base Course Finishing and Preparation
- .32 Base courses which are to receive unbonded or loose laid toppings are to be finished smooth by means of a steel trowel.
- .33 Placing and Finishing Toppings
- .34 Place toppings on bond breaker and finish the toppings in accordance with CSA A23.1.
- .35 Curing
- .36 Continuously wet cure unbonded toppings for a minimum of seven days.
- .37 Jointing
- .38 Unbonded toppings are to be saw cut, as per the typical detail for slabs-on-grade, at a maximum spacing of 3.0 metres in both directions, unless noted otherwise in the Contract Documents. For toppings that are to receive hard architectural floor finishes, the jointing shall be laid out in accordance with the Consultant's requirements and is subject to final approval by the Consultant.
- .39 Cracks in Toppings
- .40 All cracks in concrete toppings shall be repaired by the Contractor. Extent of repair and method of crack repair shall meet the requirements of the flooring installation Contractor and the Owner.

3.13 OPENINGS THROUGH COMPLETED MEMBERS

- .1 Do not cut openings through completed members without the Consultant's approval.
- .2 Where the location of openings is approved, locate the reinforcement by x-ray, scanning, cover meter or other positive means as required by the Consultant and adjust the location of the opening so that no reinforcement is cut unless specifically approved otherwise in writing by the Consultant.
- .3 In the case of precast concrete slabs, holes shall be cut or drilled only by the precast concrete Contractor.

3.14 MAKING GOOD

- .1 Where directed by the Consultant, make good temporary openings left in concrete construction around pipes, ducts and the like using a mortar of the same proportions as the surrounding Work. Reinforce mortar with welded wire fabric where openings exceed 75 mm. Roughen existing surfaces to receive mortar or apply suitable bonding agent such that mortar will be securely bonded to existing concrete.

3.15 GROUTING BENEATH BASE PLATES

- .1 Grout beneath plates bearing on concrete with an approved non-shrink flowable grout. Comply with the manufacturer's directions for mixing and placing grout. Completely fill voids below plates. Fill voids left by shims after shims are removed.
- .2 During cold weather, preheat base plates and footings and maintain temperature at minimum 12°C for 6 days after grouting.
- .3 Refer to Section 05 12 00 – Structural Steel for lifting of base plates to determine adequacy of grouting. If defects are found, more base plates will be raised.

3.16 TREATMENT OF FORMED SURFACES

- .1 Do Work in accordance with CSA A23.1 and as follows:
 - .1 Provide smooth form finish to concrete surfaces exposed to public view and surfaces to receive plaster, damp-proofing, moisture resistant membrane and the like.
 - .2 Remove traces of form lining compound from concrete surfaces which may affect the bonding of following surface application.

3.17 WATER STORAGE TANKS (WATER TIGHT CONSTRUCTION)

- .1 Conform with the requirements of this Section including the following for the construction of the walls and base slabs of the water storage tanks members designated to be watertight.
- .2 Temperature Control
 - .1 Concrete temperature at time of delivery 27°C maximum, 18°C minimum.

- .2 Maximum cooling rate not to exceed 7°C per day.
- .3 In the case of the base slab, employ a temperature monitoring system during each pour to determine the internal concrete temperature at regular intervals. Submit details of the proposed monitoring system to the Consultant for review.
- .3 Joints
 - .1 For each pour, arrange to begin saw-cutting of joints no later than 30 minutes after the maximum temperature in each pour is reached, and to complete the saw-cutting within a maximum of 2 hours.
 - .2 Note that this timing of saw-cutting could occur at any time of the day or night. Plan accordingly.
- .4 Curing
 - .1 Maintain 7 days continuous moist curing after placing concrete. Provide an approved membrane waterproofing immediately thereafter.
- .5 Crack Repair
 - .1 Just prior to the installation of the tank liner and insulation, carefully examine all exposed interior and exterior surfaces and repair any cracks in them.
- .6 Water Test
 - .1 At least 28 days after concreting the last section of each pool or tank, and after the sealing of joints, fill each pool or tank with water and leave standing for 10 days.
 - .2 Fill each pool or tank gradually such that the differential temperature between the water the pool or tank concrete does not exceed 7°C.
 - .3 Locate and repair all areas where leakage occurs and retest until each pool or tank is watertight.

3.18 QUALITY CONTROL

- .1 Implement a system of quality control to ensure that the minimum standards specified in this Section are attained.
- .2 Adhere to the requirements of the project "Concrete Quality Plan" prepared and submitted as required by this Specification.
- .3 Bring to the attention of the Consultant any defects in the Work or departures from the Contract Documents which may occur during Construction. The Consultant will decide upon corrective action and will provide recommendations in writing.
- .4 The Consultant's general review during construction and inspection and testing by independent inspection and testing agencies reporting to the Consultant are both undertaken to inform the Owner of the Contractor's performance and shall in

no way augment the Contractor's quality control or relieve the Contractor of its contractual responsibility.

3.19 NOTIFICATION

- .1 Prior to commencing significant segments of the Work, give the Consultant and independent inspection and testing companies appropriate notification so as to afford them reasonable opportunity to review the Work. Failure to meet this requirement may be cause for the Consultant to classify the Work as defective.

3.20 INSPECTION AND TESTING

- .1 Appointment of Independent Inspection and Testing Companies
 - .1 The Owner or Consultant will appoint the independent inspection and testing companies to make inspections or perform tests as the Consultant directs. The independent inspection and testing companies shall be responsible only to the Consultant, and shall make only such inspections or tests as the Consultant may direct.
 - .2 When defects are revealed, the Owner may request, at the Contractor's expense, additional inspection or testing to ascertain the full extent of the defect.
- .2 Concrete Quality Tests
 - .1 Concrete quality tests shall be carried out in accordance with CSA A23.1 and shall include the following:
 - .1 Slump
 - .2 Air content of fresh concrete
 - .3 Temperature of fresh concrete
 - .4 Compressive strength
 - .5 Density (for low-density and semi-low-density concrete only)
 - .2 Compressive Strength Tests: Compressive cylinder testing will be carried out in accordance with CSA A23.1 and as follows: Three companion laboratory cured concrete standard compression test cylinders; one tested at 7 days and two tested at 28 days, constitute a strength test. During the placing of concrete in cold weather one additional field cured test cylinder will be made and tested at 7 days.
 - .3 High Strength Concrete and HVSCM Concrete: Compressive cylinder testing will be carried out in accordance with CSA A23.1 and as follows: Four companion laboratory cured concrete standard compression test cylinders; one tested at 7 days, one tested at 28 days and two tested at 56 or 91 days, whichever is the specified test age. In addition, two accelerated test cylinders shall be made and tested in accordance with Standard CSA A23.2.
 - .4 Core Samples for Chloride Ion Permeability Test

- .1 C-1, A-1 and C-XL concrete exposure classes: Chloride ion permeability test shall be carried out in accordance to CSA A23.1 and ASTM C1202 and as follows: Each test shall consist of 4 companion in-situ core specimens at locations determined by the Consultant. Test one core specimen at 7 days, one at 28 days and two at 56 days.
- .2 Where cores are taken for chloride ion permeability tests, the core areas are to be filled and reinstated with King Self-Leveling Concrete or suitable equivalent approved by the Consultant. The Independent Testing and Inspection agency will perform four concrete cores for each pour consisting of concrete exposure class C-1, A-1 or C-XL.
- .3 Tensile Bond Tests: Tensile bond tests will be carried out in accordance with CSA A23.1 for all bonded toppings.
- .3 Grout under Baseplates: At least one strength test may be made each day that grout is placed under baseplates.
- .4 Inspection of Substrate
 - .1 Substrate at footing founding elevations will be inspected.

3.21 DEFECTIVE MATERIALS AND WORK

- .1 Where evidence exists that defective Work has occurred or that Work has been carried out incorporating defective materials, the Consultant may have tests, concrete coring, inspections or surveys performed, analytical calculations of structural strength made and the like in order to help determine whether the Work must be repaired or replaced. Tests, inspections or surveys or calculations carried out under these circumstances will be made at the Contractor's expense, regardless of their results, which may be such that, in the Consultant's opinion, the Work may be acceptable.
- .2 All testing shall be conducted in accordance with the requirements of the local building code identified on the Structural General Notes, except where this would in the Consultant's opinion cause undue delay or give results not representative of the rejected material in place. In this case, the tests shall be conducted in accordance with the standards given by the Consultant.
- .3 Materials or Work which fails to meet the requirements specified in the Contract Documents may be rejected by the Consultant whenever found at any time prior to the Total Performance of the Work regardless of previous inspection. If rejected, defective materials or Work shall be promptly removed and replaced or repaired to the satisfaction of the Consultant, at no expense to the Owner.

END OF SECTION 03 30 00

1 GENERAL

1.01 RELATED REQUIREMENTS

- .1 Not Used.

1.02 DEFINITIONS

- .1 Environmental Product Declaration (EPD): Third-party verified documentation with the supporting Product Category Rule (PCR) and Life cycle assessment information. Prepared in accordance with ISO 14025, 14040, 14044, and EN 15804 or ISO 21930 and having at least a cradle-to-gate scope.
- .1 Industry-wide (generic) EPD with third-party certification (Type III), including external verification in which the manufacturer is explicitly recognized as the participant by the program operator.
- .2 Product-specific Type III EPD - Products with third-party certification (Type III), including external verification in which the manufacturer is explicitly recognized as the participant by the program operator.
- .3 Supplementary Cementitious Materials (SCMs): Materials added to concrete which contribute to the properties of hardened concrete through hydraulic or pozzolanic activity.
- .4 Workability: This term broadly describes the total properties and expectations for concrete delivered to site as follows:
- .5 Individual tested properties of concrete that account for confined or free flow slump, penetration, compaction, or relative plasticity of various concrete mix designs used for the project.
- .6 Overall properties involved with mixing, handling, transportation, and placement using vibratory compaction methods without loss of homogeneity of in-place concrete.

1.03 REFERENCE STANDARDS

- .1 ASTM International (ASTM):
- .2 ASTM D 1751-18, Standard Specification for Preformed Expansion Joint Filler for Concrete Paving and Structural Construction (Nonextruding and Resilient Bituminous Types)
- .3 CSA Group (CSA):
- .4 CSA A23.1:19 /CSA A23.2:19, Concrete Materials and Methods of Concrete Construction/Test Methods and Standard Practices for Concrete
- .5 CSA A3000-18, Cementitious Materials Compendium

1.04 ACTION AND INFORMATIONAL SUBMITTALS

- .1 Shop Drawings:
 - .1 Submit drawings stamped and signed by a professional engineer registered or licensed in

Province of Ontario, Canada.

- .2 Submit shop drawings prepared in accordance with Contract Drawings to clearly show size, shape, location, and necessary details of reinforcing.
- .3 Submit shop drawings showing formwork and falsework design to CSA A23.1/CSA A23.2.
- .2 Submit placing drawings prepared in accordance with plans to clearly show size, shape, location and necessary details of reinforcing.
- .2 Samples:
 - .1 When requested, submit samples of the following materials for review and acceptance: joint filler.
- .3 Provide testing reports for review by Consultant and do not proceed without written approval when deviations from mix design or parameters are found.

1.05 QUALITY ASSURANCE

- .1 Submit valid and recognized certificate from plant delivering concrete to Consultant a minimum four weeks before starting concrete work.
- .2 Quality Control Plan: Submit written report to Consultant verifying compliance of cast-in-place concrete to performance requirements.
- .3 Mock-Ups: Construct mock-up of all separate concrete finishes on all landscape walls and surfaces.
 - .1 Build mock-up in location where jointly agreed between Contractor and Consultant.
 - .2 Mock-up size: 1.5 m by 1.5 m, illustrating horizontal surfacing.
 - .3 Mock-up may form part of permanent structure when accepted by Consultant.
- .4 Allow 24 hours for inspection of mock-up before proceeding with work.
- .5 When accepted, mock-up will demonstrate minimum standard of quality required for this work.

1.06 DELIVERY, STORAGE, AND HANDLING

- .1 Delivery and Acceptance Requirements:
 - .1 Concrete hauling time: Deliver to site of work and discharge within a maximum of 120 minutes after batching.
 - .1 Modifying maximum time limit before receiving written agreement from Consultant and concrete producer as described in **CSA A23.1/CSA A23.2** is prohibited.
 - .2 Submit deviations for review by Consultant.
- .2 Concrete delivery: Ensure continuous concrete delivery from plant meets **CSA A23.1/CSA A23.2**.

1.07 AMBIENT CONDITIONS

- .1 Placing concrete during rain or weather events that could damage concrete is prohibited.
- .2 Protect newly placed concrete from rain or weather events in accordance with **CSA A23.1/CSA**

A23.2.

- .3 Cold weather protection:
 - .1 Maintain protection equipment in readiness on site.
 - .2 Use protection equipment when ambient temperature below is 5°C, or when temperature may fall below 5°C before concrete has cured.
 - .3 Placing concrete upon or against surface at temperature below 5°C is prohibited.
- .4 Hot weather protection:
 - .1 Protect concrete from direct sunlight when ambient temperature is above 27°C.
 - .2 Prevent forms from getting too hot before concrete is placed. Apply accepted methods of cooling that will not negatively affect concrete.
- .5 Protect from drying.

2 PRODUCTS

2.01 DESIGN CRITERIA

- .1 Performance: To **CSA A23.1/CSA A23.2**, and as described in MIXES in PART 2 - PRODUCTS of this Section.

2.02 PERFORMANCE CRITERIA

- .1 Quality Control Plan: Ensure concrete supplier meets performance criteria of concrete as established in Contract Documents. Submit verification of compliance as described in QUALITY ASSURANCE in Part 1 of this Section.

2.03 MATERIALS

- .1 Portland Cement: Grey Portland Cement in accordance with [CSA A3000](#), Type I/II.
- .2 Water: To **CSA A23.1/CSA A23.2**.
- .3 Bituminous impregnated fibreboard: To [ASTM D 1751](#).
- .4 Other concrete materials: To **CSA A23.1/CSA A23.2**.

2.04 MIXES

- .1 Alternative 1 - Performance Method for specifying concrete: To meet Consultant performance criteria to **CSA A23.1/CSA A23.2**.
- .1 Ensure concrete supplier meets performance criteria as established below and provide verification of compliance as described in VERIFICATION in Part 3 of this Section.
- .2 Provide concrete mix to meet the following plastic state requirements:
 - .1 Workability: Free of surface blemishes, loss of mortar, colour variations and segregation.
- .3 Provide concrete mix to meet the following hard state requirements:
 - .1 Durability and class of exposure: C-2
 - .2 Compressive strength at 28 days age: Minimum 32 MPa

- .3 Aggregate size maximum 19 mm
- .4 Concrete mixture for site furnishing footings to follow manufacturer's recommendations.
- .5 Submit concrete supplier's certification.
- .6 Submit quality management plan to ensure verification of concrete quality to specified performance.

2.05 COLOURED CONCRETE

- .1 TORONTO REDIMIX, Canada, Concord, ON
 - .1 Contact:
 - .1 <https://www.torontoredimix.com/>
 - .2 Email: sales@torontoredimix.com
 - .3 Tel.: +1 416 798 7060
 - .2 Colour: Charcoal Gray

3 EXECUTION

3.01 PREPARATION

- .1 Notify Consultant a minimum 24 hours before each concrete pour.
- .2 During concreting operations:
 - .1 Development of cold joints not allowed.
 - .2 Ensure concrete delivery and handling facilitates placing with minimum of rehandling, and without damage to existing structure or Work.

3.02 INSTALLATION

- .1 Do cast-in-place concrete work in accordance with **CSA A23.1/CSA A23.2**.
- .2 Cast-in sleeves, ties, slots, anchors, reinforcement, frames, conduit, bolts, waterstops, joint fillers and other inserts required to be built-in.
- .1 Sleeves and openings greater than 100 mm x 100 mm that are not indicated in the reviewed shop drawings must be approved by Consultant.

3.03 FINISHES

- .1 Pavements, walkways, curbs, and exposed site concrete:
 - .1 Screed to plane surfaces and use wood floats.
 - .2 Provide round edges and joint spacing using standard tools.
 - .3 Float surface with power-driven floats or by hand floating if area is small or inaccessible to power units. Finish surfaces to true planes. Cut down high spots and fill low spots. Refloat surface immediately to uniform granular texture.
 - .4 Trowel smooth and provide medium-to-fine texture broom finish. Draw a soft bristle broom across float-finished concrete surface, perpendicular to line of traffic, to provide a uniform, fine-line texture.

3.04 CONTROL JOINTS

- .1 Form control joints in slabs-on-grade at locations indicated, to **CSA A23.1/CSA A23.2** and install specified joint sealer/filler.
- .2 General: Form construction, isolation and contraction joints and tool edges true to line, with faces perpendicular to surface plane of concrete. Construct transverse joints at right angles to centerline unless otherwise indicated.
 - .1 When joining existing paving, place transverse joints to align with previously placed joints unless otherwise indicated.
 - .2 Set joints as indicated in Contract Documents.
- .3 Construction Joints: Set construction joints at side and end terminations of paving and at locations where paving operations are stopped for more than one-half hour unless paving terminated at isolation joints.
 - .1 Continue steep reinforcement across construction joints unless otherwise indicated. Do not continue reinforcement through sides of paving strips unless otherwise indicated.
 - .2 Provide tie bars at sides of paving strips where indicated.
 - .3 Butt joints: Use bonding agent at joint locations where fresh concrete is placed against hardened or partially hardened concrete surfaces.
 - .4 Dowelled Joints: Install dowel bars and support assemblies at joints where indicated. Lubricate or coat with asphalt one-half of dowel length to prevent concrete bonding to one side of joint.
- .4 Isolation Joints: Form isolation joints of preformed joint-filler strips abutting concrete curbs, catch basins, manholes, inlets, structures, other fixed objects, and where indicated.
 - .1 Locate expansion joints at intervals of 6.0 m (maximum 9.0m) unless otherwise indicated.
 - .2 Extend joint fillers full width and depth of joint.
 - .3 Terminate joint filler not less than 13 mm or more than 25 mm below finished surface if joint sealant is indicated.
 - .4 Place top of joint filler flush with finished concrete surface if joint sealant is not indicated.
 - .5 Furnish joint fillers in one-piece lengths. Where more than one length is required, lace or clip joint-filler sections together.
 - .6 During concrete placement, protect top edge of joint filler with metal, plastic, or other temporary preformed cap. Remove protective cap after concrete has been placed on both sides of joint.
- .5 Contraction Joints: Form weakened-plane contraction joints, sectioning concrete into areas as indicated. Construct contraction joints for a depth equal to at least one-fourth of the concrete thickness, as follows, to match jointing of existing adjacent concrete paving:
 - .1 Grooved Joints: Form contraction joints after initial floating by grooving and finishing each edge of joint with grooving tool to a 6-mm radius. Repeat grooving of contraction joints after applying surface finishes. Eliminate grooving-tool marks on concrete surfaces.
 - .2 Tolerance: Ensure that grooved joints are within 75 mm either way from centers of dowels.
- .6 Edging: After initial floating, tool edges of paving, gutters, curbs, and joints in concrete with an edging tool to a 6-mm radius. Repeat tooling of edges after applying surface finishes. Eliminate

edging-tool marks on concrete surfaces.

3.05 EXPANSION AND ISOLATION JOINTS

- .1 Install pre-moulded joint filler in expansion and isolation joints at full depth of slab and flush with finished surface to **CSA A23.1/CSA A23.2**.

3.06 CURING

- .1 Use curing compounds compatible with applied finish on concrete surfaces free of bonding agents and to **CSA A23.1/CSA A23.2**.

3.07 TOLERANCES

- .1 Concrete floor slab finishing tolerance to **CSA A23.1/CSA A23.2** and as follows:
 - .1 Elevation: 19 mm.
 - .2 Thickness: Plus 10 mm, minus 6 mm.
 - .3 Surface: Gap below 3-m-long; unleveled straightedge not to exceed 13 mm.
 - .4 Alignment of Tie-Bar End Relative to Line Perpendicular to Paving Edge: 13 mm per 300 mm of tie bar.
 - .5 Lateral Alignment and Spacing of Dowels: 25 mm.
 - .6 Vertical Alignment of Dowels: 6 mm.
 - .7 Alignment of Dowel-Bar End Relative to Line Perpendicular to Paving Edge: 6 mm per 300 mm of dowel.
 - .8 Joint Spacing: 75 mm.
 - .9 Contraction Joint Depth: Plus 6 mm, no minus.
 - .10 Joint Width: Plus 3 mm, no minus.

3.08 SITE QUALITY CONTROL

- .1 Concrete testing: To **CSA A23.1/CSA A23.2** by testing laboratory. Accelerated test methods apply.
 - .1 Testing laboratory designated by Consultant.
 - .2 Concrete testing will be paid for by Contractor.
- .2 Strength of each concrete mixture will be satisfactory if average of any three consecutive compressive-strength tests equals or exceeds specified compressive strength and no compressive-strength test value falls below specified compressive strength by more than 3.4 MPa.
- .3 Test results shall be reported in writing to Consultant, concrete manufacturer, and Contractor within 48 hours of testing. Reports of compressive-strength tests shall contain Project identification name and number, date of concrete placement, name of concrete testing and inspecting agency, location of concrete batch in Work, design compressive strength at 28 days, concrete mixture proportions and materials, compressive breaking strength, and type of break for both 7- and 28-day tests.
- .4 Nondestructive Testing: Impact hammer, sonoscope, or other nondestructive device may be

permitted by Prime Consultant but will not be used as sole basis for approval or rejection of concrete.

- .5 Additional Tests: Testing and inspecting agency shall make additional tests of concrete when test results indicate that slump, air entrainment, compressive strengths, or other requirements have not been met, as directed by Prime Consultant.
- .6 Concrete paving will be considered defective if it does not pass tests and inspections.
- .7 Additional testing and inspecting, at Contractor's expense, will be performed to determine compliance of replaced or additional work with specified requirements.
- .8 Prepare test and inspection reports.

3.09 CLEANING

- .1 Use trigger operated spray nozzles for water hoses.
- .2 Designate cleaning area for tools to limit water use and runoff.
- .3 Provide appropriate area on Project site where concrete trucks can be safely washed out.
- .4 Do not dispose of unused admixtures and additive materials into sewer systems, into lakes, streams or in other location where it will pose health or environmental hazard.

END OF SECTION

Part 1 General

1.1 SUMMARY

.1 Section Includes:

- .1 The Work in this Section is concrete finishing and shall include all labor, materials and equipment to complete the installation.
 - .1 Preparation Work, including sub-grade preparation, compaction, finish grading, construction of formwork, placement of screeds, and installation of reinforcement, when required, shall be done by a qualified Contractor.
 - .2 Provide, place and finish concrete as specified elsewhere.
 - .3 Provide all necessary or required special concrete preparation as specified elsewhere.
 - .4 Provide all necessary repair and patch Work.

.2 Related Requirements:

- .1 Section 03 30 00 – Cast-in-Place Concrete.
- .2 Section 09 30 13 – Tiling.
- .3 Section 09 65 00 – Resilient Flooring.
- .4 Section 32 13 13 – Concrete Paving, Sidewalks, Curbs, and Gutters.

1.3 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Submit product data in accordance with Section 01 33 00 – Submittal Procedures.
 - .1 Submit manufacturer's printed product literature, specifications and data sheet for each product specified.
 - .2 Submit WHMIS SDS - Safety Data Sheets. WHMIS SDS acceptable to Labour Canada and Health and Welfare Canada for concrete floor treatment materials. Indicate VOC content.
 - .3 Include application instructions for concrete floor treatments.

1.4 CLOSEOUT SUBMITTALS

- .1 Submit closeout data in accordance with Section 01 78 00 – Closeout Submittals.
 - .1 Provide manufacturer's printed recommendations for general maintenance, including cleaning instructions and submit a complete list of floor care products that will be required for on-going maintenance.
- .2 LEED Submittals: provide LEED submittals in accordance with Section 01 61 01 - LEED Product Requirements.

1.5 QUALITY ASSURANCE

- .1 Performance Requirements
 - .1 Product quality and quality of work in accordance with Section 01 61 01 - LEED Product Requirements.
 - .2 Submit written declaration that components used are compatible and will not adversely affect finished flooring products and their installation adhesives.

1.6 DELIVERY, STORAGE, AND HANDLING

- .1 Packaging Waste Management
 - .1 Separate and recycle waste materials in accordance with Section 01 74 19 – Construction Waste Management.

1.7 SITE CONDITIONS

- .1 Temporary lighting:
 - .1 Minimum 1200 W light source, placed 2.5 m above floor surface, for each 40 sq m of floor being treated.
- .2 Electrical power:
 - .1 Provide sufficient electrical power to operate equipment normally used during construction.
- .3 Work area:
 - .1 Make the work area water tight protected against rain and detrimental weather conditions.
- .4 Temperature:
 - .1 Maintain ambient temperature of not less than 10 degree C from seven days before installation to at least 48 hours after completion of work and maintain relative humidity not higher than 40% during same period.
- .5 Moisture:
 - .1 Ensure concrete substrate is within moisture limits prescribed by flooring manufacturer.
- .6 Safety:
 - .1 Comply with requirements of Workplace Hazardous Materials Information System (WHMIS) regarding use, handling, storage, and disposal of hazardous materials.
- .7 Ventilation:
 - .1 Arrange for ventilation system to be operated during installation of concrete floor treatment materials by use of approved portable supply and exhaust fans.
 - .2 Ventilate enclosed spaces in accordance with Section 01 51 00 - Temporary Utilities and in accordance with OH & S Regulations.
 - .3 Provide continuous ventilation during and after coating application.

Part 2 Products

2.1 PERFORMANCE/DESIGN CRITERIA

- .1 Refer to Structural Drawings for Slab Cambers as these numbers will rule over the items below.

- .2 Non-Critical Floor Slabs: Floors having a straightedge value of ± 8 mm over 3050 mm; similar to CSA A23.1 Class A Slab Finishing.
- .3 Light Duty Industrial or Commercial Floors: Floors having a straightedge value of ± 6 mm over 3050 mm; similar to CSA A23.1 Class B Slab Finishing.
- .4 Flat Institutional or Commercial Floors: Floors having a straightedge value of ± 5 mm over 3050 mm; similar to CSA A23.1 Class C Slab Finishing.

2.2 LEVELLING MATERIALS

- .1 Underlayment: Cementitious, self levelling, single component, polymer modified underlayment and manufacturer's low VOC recommended primer, for application thicknesses to a minimum feather edge to 13 mm.
 - .1 Acceptable Materials:
 - .1 K 15 Premium Self Levelling Underlayment, Ardex.
 - .2 CustomTech TechLevel 150, Custom Building Products
 - .3 Supercap SC500, Laticrete
 - .4 Novoplan® 2 Plus, MAPEI.
 - .5 Sikafloor Level 125, Sika.
 - .6 Sure-Flo ST, W.R. Meadows.
 - .2 Cementitious, self levelling, single component, polymer modified overlayment, for application thicknesses as recommended by the manufacturer.
 - .1 Acceptable Materials:
 - .1 NXT, Laticrete with NXT Epoxy Primer.
 - .2 Ultraplan 1 Plus, MAPEI Inc.
 - .3 Sikafloor Level 25, Sika Canada Ltd.
 - .3 Patching and Flash Patching Materials: Cementitious based, polymer modified, fine aggregate, single component, rapid curing, early strength floor patching compounds having high adhesion with manufacturer's recommended primer and surface profile; for application in thicknesses to a minimum of 4 mm to 25 mm, and as follows:
 - .1 Acceptable Materials:
 - .1 SD-P, Ardex.
 - .2 CustomTech TechPatchMP, Custom Building Products.
 - .3 Skim Lite, Laticrete.
 - .4 Planiprep SC, MAPEI Inc.
 - .5 SikaQuick 1000, Sika.
 - .6 Sealtight Meadow-Crete H, W.R. Meadows.
 - .4 Fine Finish Flash Patching Materials: Cementitious based, polymer modified, fine aggregate, single component, ultra-fast drying, early strength floor patching compounds having high adhesion with manufacturer's recommended primer and surface profile; for application in thicknesses from 0 mm to 6 mm, and as follows:
 - .1 Acceptable Materials:
 - .1 SD-F Feather Finish®, Ardex.

- .2 CustomTech Silk Patch, Custom Building Products
- .3 Laticrete
- .4 Planipatch®, MAPEI.
- .5 Sika® Level SkimCoat CA, Sika.
- .6 Sealtight Meadow-Patch® T1, W.R. Meadows.

2.3 CRACK REPAIR MATERIALS

- .1 Crack repair and filler: two-component, nonshrink, 100% solids, moisture-insensitive, VOC free, and meeting the requirements of ASTM C881.
 - .1 Basis-of-Design Materials:
 - .1 Mapefloor Patch, MAPEI Canada Inc.

2.4 HARDENERS

- .1 Type: one, Sodium silicate, permanent penetrating sealer and hardener.
 - .1 Liquid applied, water based, chemically reactive.
 - .2 Non-toxic, non-flammable, and anti-dusting have low or no VOC.
 - .3 Colour: colourless.
 - .4 Acceptable Materials:
 - .1 Protech III, Cornerstone Coatings.
 - .2 Ashford Formula, Curecrete.
 - .3 Pentra-Hard, Dayton Superior
 - .4 Euco Diamond Hard, Euclid Chemical Company.
 - .5 L & M Seal Hard, Laticrete International, Inc.
 - .6 Mapecrete Hard SI, Mapei Inc.
 - .7 Sikafloor 3S, Sika Canada.
 - .8 Liqui-Hard, W.R. Meadows Inc.
- .2 Water: potable.

2.5 CURING COMPOUNDS

- .1 Select low VOC, water-based, organic-solvent free curing compounds.
 - .1 Concrete Curing Compounds: maximum VOC limit 100 g/L in accordance with SCAQMD Rule #1113.

2.6 MIXES

- .1 Mixing, ratios and application in accordance with manufacturer's instructions.

2.7 ACCESSORIES

- .1 Joint Filler: flexible, lightweight, non-staining closed cell polyethylene. Chemical resistant Ultraviolet stable and low density compressible foam having the following properties:
 - .1 Density: 32.04 kg/cu.m to ASTM D1751
 - .2 Compression, ASTM D3575

- .1 10% Deflection: 69 KPa maximum
- .2 80% Deflection: 862.49 KPa maximum
- .3 Tensile Strength: 379.5 KPa to ASTM D3575
- .4 Water Absorption: 0.5% volume maximum to ASTM D3575
- .5 Basis-of-Design Materials:
 - .1 Deck-O-Foam, W.R. Meadows
- .2 Edge Joint Filler: ASTM D1751, bituminous impregnated fibreboard, 13 mm thick minimum.
- .3 Control Joint Filler: as indicated in Section 07 92 00 - Sealants.
- .4 Control Joint Filler:
 - .1 Two component, epoxy-urethane, load bearing, self levelling sealant.
 - .1 Basis-of-Design Materials:
 - .1 Loadflex, Sika Canada.
- .5 Waterstop Gasket and Waterstop Sealant: Hydrophilic, bentonite based expanding strip waterstop.
 - .1 Acceptable Materials:
 - .1 RX-101 and compatible Cetseal adhesive, Cetco.
 - .2 Waterstop RX 101, Mapei Inc.
 - .3 Hydrophilic Bentonite Strips, IRA
 - .4 Idrostop B25, MAPEI Inc.
 - .5 Sika SwellStop, Sika.
 - .6 Superstop, Tremco

Part 3 Execution

3.1 EXAMINATION

- .1 Prepare floor surface in accordance with CSA A23.1.
- .2 Verify that slab surfaces are ready to receive work and elevations are as instructed by manufacturer.

3.2 PREPARATION OF EXISTING SLAB

- .1 Rub exposed sharp edges of concrete with carborundum to produce 3 mm radiused edges unless otherwise indicated.
- .2 Saw cut control joints to CSA-A23.1, 24 hours maximum after placing of concrete.
- .3 Bring to an even, level or sloping surface as indicated on the drawings the tops of all floor slabs, including slabs on grade, ready to receive the specified finish.
- .4 Provide minimum floor flatness (F_F) required to CSA-A23.1/A23.2, Table 16, Class A conventional smooth, straight edge tolerance $\pm 8\text{mm}$, overall. $F\text{-number } F_F20$, F_L15 , Waviness Index SWI 5mm.

- .5 Finish interior floors indicated as exposed concrete in accordance with the slab finishing schedule on the structural drawings. For slab areas not noted in the finishing schedule, slabs shall be smooth concrete with steel trowel finish.
- .6 Depress floor slabs where shown and as required for floor finishes.
- .7 Remove any curing agents used during concrete installation a minimum of 28 days prior to installation of flooring materials.
- .8 Use mechanical stripping to remove chlorinated rubber or existing surface coatings.
- .9 Use protective clothing, eye protection, and respiratory equipment during stripping of chlorinated rubber or existing surface coatings.

3.3 FINISHING FORMED SURFACES

- .1 Requirements listed below apply to normal structural concrete; refer to Section 03 30 00 - Cast-in-Place Concrete for additional requirements for formed exposed architectural concrete.
- .2 Unspecified Finish: Provide following finishes as applicable when finish of formed surfaces is not specifically indicated:
 - .1 Unexposed Surfaces:
 - .1 Rough form finish for concrete not exposed to view.
 - .2 Smooth form finish for concrete to receive membrane waterproofing.
 - .2 Exposed Surfaces:
 - .1 Smooth form finish for concrete surfaces exposed to view.
- .3 Rough Form Finish: Leave surfaces with texture imparted by forms; patch tie holes and defects; remove fins longer than 6 mm high.
- .4 Smooth Form Finish: Coordinate as necessary to secure form construction using smooth, hard, uniform surfaces with number of seams kept to a minimum, uniformly spaced in an orderly pattern; patch tie holes and defects; completely remove fins. Grind smooth or repair surface textures that result from forms with raised grain, torn surfaces, worn edges, patches, dents, or other defects.
- .5 Related Unformed Finish: Strike-off concrete smooth and finish with using texture matching adjacent formed surfaces at tops of walls, horizontal offsets, and similar unformed surfaces occurring adjacent to formed surfaces; continue final surface treatment of formed surfaces uniformly across adjacent unformed surfaces.
- .6 Penetrating Sealer Finish: Apply penetrating sealer to vertical and overhead surfaces after any patching, joint sealing or caulking is completed in accordance with manufacturer's written instructions.

3.4 FINISHING FLOORS AND SLABS

- .1 Finish floors and slabs in accordance with CSA A23.1 and ACI 302.1R recommendations for screeding, re-straightening, and finishing operations for concrete surfaces; do not wet concrete surfaces.
- .2 Scratch Finishing:

- .1 Texture concrete surface that have been screeded and bull-floated or darbied while still plastic.
- .2 Use stiff brushes, brooms, or rakes to produce a profile amplitude of 6 mm in one direction.
- .3 Apply scratch finishing to surfaces to receive mortar setting beds for bonded cementitious floor finishes.
- .3 Float (Initial) Finishing:
 - .1 Consolidate surface with power driven floats or by hand floating if area is small or inaccessible to power driven floats.
 - .2 Re-straighten, cut down high spots, and fill low spots.
 - .3 Repeat float passes and re-straightening until surface is left with a uniform, smooth, granular texture.
 - .4 Apply float finishing to surfaces receiving trowel finishing and receiving fluid applied and sheet waterproofing.
- .4 Trowel (Final) Finishing:
 - .1 Commence trowel finishing after all bleed water has disappeared and when the concrete has stiffened sufficiently to prevent the working of excess mortar to the surface.
 - .2 Apply first trowelling and consolidate concrete by power-driven trowel (only use hand trowel where power-driven trowel cannot be used) after applying float finishing; continue trowelling passes and re-straighten until surface is free of trowel marks and uniform in texture and appearance; repair or smooth any surface defects that would telegraph through applied coatings or floor covering.
 - .3 Apply a trowel finishing to surfaces exposed to view or to be covered with resilient flooring, carpet, ceramic or quarry tile set over a cleavage membrane, paint, or another thin-film-finish coating system.
 - .4 Finish surfaces to the tolerances indicated above.
- .5 Trowel and Fine Broom Finishing:
 - .1 Apply trowel finishing to surfaces where ceramic or quarry tile is scheduled for installation by either thickset or thin-set method.
 - .2 Slightly scarify surface with a fine broom While concrete is still plastic.
 - .3 Finish surfaces to the tolerances indicated above.
- .6 Broom Finishing:
 - .1 Apply a broom finishing to exterior concrete platforms, steps, and ramps, and elsewhere as indicated.
 - .2 Slightly roughen trafficked surface by brooming with fibre bristle broom perpendicular to main traffic route immediately after float finishing.
 - .3 Coordinate required final finishing if not indicated with Consultant before application.

3.5 APPLICATION: GENERAL

- .1 Seal control joints and joints at junction with vertical surfaces with sealant after floor treatment is dry.

- .2 Apply floor treatment in accordance with Sealer manufacturer's written instructions.
- .3 Clean overspray. Clean sealant from adjacent surfaces.
- .4 Cure concrete in accordance with manufacturers recommended procedures.

3.6 APPLICATION: LIQUID APPLIED FLOOR HARDENER

- .1 Provide hardener on all exposed concrete floors unless noted otherwise.
- .2 Apply liquid floor hardener in accordance with manufacturer's written instructions after initial floating.
- .3 Cure concrete in accordance with manufacturer's recommended instructions.
- .4 Apply hardener to horizontal and vertical exposed concrete to remain unfinished.

3.7 APPLICATION: WATERSTOPS

- .1 Install in accordance with manufacturer's written instructions at exterior construction joints.
- .2 Ensure concrete is free of voids, honeycombing, segregation of the mix, or any conditions which leads to concrete permeability.
- .3 Install in all applicable exterior vertical and horizontal cast-in-place concrete constructions joints, around applicable penetration and structural members. Leaving a minimum of 75mm of concrete cover to the exterior.
- .4 Tightly butt coil ends together to form continuous waterstop.
- .5 Protect installed waterstop from prehydration prior to concrete placement and product encapsulation.

3.8 NON-CONFORMING WORK

- .1 Inspect surfaces for defects immediately after removal of forms. Repair or patch defects within 48 hours of removal of forms with cure repairs same as new concrete.
- .2 Defective Areas: where patches are allowed, repair and patch areas to match surrounding areas in texture and colour.

3.9 PROTECTION

- .1 Protect finished installation in accordance with manufacturer's instructions.

3.10 MAINTENANCE

- .1 Provide training to Owners representative based on written manufacturers instructions as indicated in Section 01 78 00 – Closeout Submittals.

END OF SECTION

Part 1 General

1.1 SUMMARY

- .1 This Section includes unit masonry assemblies consisting of the following:
 - .1 Concrete masonry units (CMU).
 - .2 Mortar and grout.
 - .3 Steel reinforcing bars.
 - .4 Masonry joint reinforcement.
 - .5 Ties and anchors.
 - .6 Embedded flashing.
 - .7 Miscellaneous masonry accessories.
- .2 Related Requirements:
 - .1 Section 05 50 00 – Metal Fabrications
 - .2 Section 07 27 13 – Modified Bituminous Air and Vapour Barrier
 - .3 Section 07 62 00 – Sheet Metal Flashing and Trim
 - .4 Section 07 84 00 – Firestopping and Smoke seals
 - .5 Section 07 92 00 – Sealants
 - .6 Section 08 11 13 – Steel Doors and Frames
 - .7 Section 09 91 00 – Painting

1.3 ADMINISTRATIVE REQUIREMENTS

- .1 Coordination:
 - .1 Coordinate lines, levels and coursing with work of other Sections.
 - .2 Obtain built-in items prior to start of this work.
- .2 Pre-Installation Meetings: convene pre-installation meeting one week prior to beginning work of this Section and on-site installation, with Contractor, Subcontractor, material supplier and Consultant to:
 - .1 Verify project requirements including specification and details for project.
 - .2 Confirm required mortar, grout and concrete testing; review batch control and grouting procedures.
 - .3 Co-ordination with related Work including, but not limited to, air/vapour membranes and insulation.
 - .4 Review cavity drainage requirements and methods for keeping mortar out of cavity spaces.
 - .5 Coordinate crack control measures.
 - .6 Review requirements for reinforcement at corners and wall intersections.
 - .7 Review membranes and membrane flashing materials and details used for construction.
 - .8 Confirm trowelled or tooled joints to concealed and exposed masonry faces.
 - .9 Review methods for controlling efflorescence during construction.
 - .10 Review hot and cold weather requirements.

1.4 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Submit product data in accordance with Section 01 33 00 – Submittal Procedures.
 - .1 Provide manufacturer's printed product literature, specifications and data sheet. Indicate masonry types, shapes, sizes, and textures.
 - .2 Cementitious Materials:
 - .1 Include brand, type, and name of manufacturer for site mixed mortar materials.
 - .2 Submit proposed mix proportions and sand analysis reports and compressive strength reports on the proposed mortar mix(es).
- .2 Shop Drawings: Submit shop drawings indicating the following:
 - .1 Indicate sizes, profiles, coursing, and locations of special shapes for concrete masonry units.
 - .2 Detail bending and placement of unit masonry reinforcing bars, including elevations of reinforced walls if required.
 - .3 Detail corner units, end dam units, and other special applications for fabricated flashings.

- .3 LEED Submittals: provide LEED submittals in accordance with Section 01 61 01 - LEED Product Requirements.

1.5 QUALITY ASSURANCE

- .1 Conform to CAN/CSA A371, except as modified by this specification.
- .2 The masonry Subcontractor shall be a member in good standing with the Ontario Masonry Contractors' Association.
- .3 The masonry Subcontractor shall have a minimum of five years of experience on projects of similar size and magnitude and shall provide continuous active supervision by a journeyman mason while masonry work is in progress.
- .4 Masonry work shall be performed by experienced, qualified journeyman masons under the direct and continual full-time supervision of certified masons.
- .5 Before starting masonry work establish mix proportions based on the limitations set out in CAN/CSA A179, Table 3 or Table 4 for mortar and Table 5 for grout.
- .6 Test laboratory prepared samples of the proposed mortar(s) for compressive strength in accordance with CAN/CSA A179, by a laboratory approved by the Owner. The Owner will pay for the initial cost of mortar testing. Any re-testing required as a result of the original test failing will be borne by the Contractor.
- .7 Connectors and joint reinforcement shall conform to CSA A370.
- .8 Miscellaneous masonry accessories, and their use where not otherwise specified but shown or required for proper completion of the Work, shall conform to CSA A371.
- .9 Retain a Professional Engineer, registered in the Province of the work, for the design, fabrication, and erection of the angle support at each floor level for brick more than 9.36 m high in accordance with applicable Building Code and Contract Documents requirements including, but not limited to, the following:
 - .1 Seal and signature to shop drawings and design submittals.
 - .2 Field review of installed components.
 - .3 Completion of Letters or Commitment and Supervision specified in Section 01 35 00 - Delegated Design.
- .10 Regulatory Requirements: Provide fire resistance rated materials and construction identical to those of assemblies with fire resistance ratings determined by ULC Listings or, as indicated by the applicable building code.
- .11 Mock-Ups:
 - .1 Construct a minimum 1.2 m x 1.2 m of one exterior wall in location agreed upon by Consultant to establish a standard of construction, workmanship, and appearance. Show reinforcement, masonry connectors, flashing, jointing, coursing, mortar, and masonry pattern, unit face alignment, texture, and colour.
 - .2 Do not continue with work of this Section until Consultant has reviewed mock-up.
 - .3 Mock-up may form a part of the completed work when written acceptance is provided by the Consultant.

1.6 DELIVERY, STORAGE, AND HANDLING

- .1 Deliver masonry units on pallets or cubes, suitably protected from road grime and moisture absorption due to exposure to rain or melting snow.
- .2 Unload and store on dry, level areas, without direct contact with the ground.
- .3 Remove plastic wrappings from concrete masonry units and cover with waterproof coverings which will provide protection from the elements but allow for air circulation.
- .4 Deliver cement, lime, and mortar in dry condition with manufacturer's label intact and store under waterproof cover and protected from elements.
- .5 Packaging Waste Management
 - .1 Separate and recycle waste materials in accordance with Section 01 74 19 – Construction Waste Management.

1.7 SITE CONDITIONS

- .1 Ambient Conditions: maintain materials and surrounding air temperature to:
 - .1 Minimum 4 degrees C prior to, during, and 48 hours after completion of masonry work.
 - .2 Maximum 32 degrees C prior to, during, and 48 hours after completion of masonry work.
 - .3 Follow weather protection requirements as indicated in CSA A371.
- .2 Provide adequate bracing for masonry during construction and until permanent lateral supports are in place.

Part 2 Products

2.1 CONCRETE MASONRY UNITS

- .1 Standard Concrete Masonry Units: to CSA A165.1 and as follows:
 - .1 Classification: H/15/A/M (standard).
 - .2 Size (Nominal): As indicated on Drawings.
 - .3 Basis-of-Design Manufacturer:
 - .1 Expocrete, An Oldcastle company.
- .2 Fire rated concrete block units: to CSA-A165 Series (CSA-A165.1) and as follows:
 - .1 Classification: H/15/B/M except as modified by fire resistance requirements specified below.
 - .2 Concrete Composition: Type L₂30S Concrete
 - .3 Fire Rating: as indicated on Drawings.

2.2 MORTAR AND GROUT MATERIALS

- .1 Use same brands of materials and source of aggregate for entire project.
- .2 Cement:

- .1 Portland Cement: to CSA-A3000, Type GU - General use hydraulic cement (Type 10) gray colour.
 - .1 Use low VOC products in compliance with SCAQMD Rule 1168.
- .2 Masonry Cement: to CAN/CSA A179, Type N.
- .3 Aggregate: supplied by one supplier.
 - .1 Fine Aggregate: to CAN/CSA A179, natural sand, manufactured sand, or silica sand.
 - .2 Coarse Aggregate: to CAN/CSA A179.
- .4 Water: clean and potable.
- .5 Lime:
 - .1 Hydrated Lime: to CAN/CSA A179, Type S
- .6 Colour Additives:
 - .1 Use colouring admixture not exceeding 10% of cement content by mass, or integrally coloured masonry cement, to produce coloured mortar to match approved sample. Admixtures to be approved prior to use. Use in accordance with the specific manufacturer's recommendations.
 - .1 Colour: selected from manufacturer's standard range.
- .7 Mortar Mixes
 - .1 Mortar for exterior masonry above grade:
 - .1 Loadbearing: type S based on proportion specifications.
 - .2 Non-Loadbearing: N based on proportion specifications.
 - .2 Mortar for interior masonry:
 - .1 Loadbearing: type S based on proportion specifications.
 - .2 Non-Loadbearing: N based on proportion specifications.
 - .3 Mortar for Parapet walls, chimneys, unprotected walls: type N based on proportion specifications, to CSA A179.
 - .4 Pointing Mortar: CSA A179, Type S using property specification with maximum two percent ammonium stearate or calcium stearate per cement weight.
 - .5 Parging mortar: type M to CSA A179.
 - .6 Mortar for foundation walls, manholes, sewers, pavements, walks, patios and other exterior masonry at or below grade: type M based on proportion specifications, CSA A179 table.
 - .7 Following applies regardless of mortar types and uses specified above:
 - .1 Mortar for grouted reinforced masonry: type S based on proportion specifications.
- .8 Mortar Mixing:
 - .1 Use pre-blended, pre-coloured mortar prepackaged under controlled factory conditions. Ingredients batching limitations to be within 1% accuracy.
 - .2 Mix mortar ingredients in accordance with CSA A179 in quantities needed for immediate use.

- .3 Maintain sand uniformly damp immediately before mixing process.
- .4 Add mortar colour in accordance with manufacturer's instructions. Provide uniformity of mix and colouration.
- .5 Do not use admixtures, including pigments, air entraining agents, accelerators, retarders, water repellent agents, or other admixtures; unless approved in writing by the Consultant.
- .6 Do not use anti-freeze compounds including calcium chloride or chloride based compounds.
- .7 Use a batch type mixer in accordance with CSA A179.
- .8 Pointing mortar: prehydrate pointing mortar by mixing ingredients dry, then mix again adding just enough water to produce damp unworkable mix that will retain its form when pressed into ball. Allow to stand for not less than one hour no more than two hours then remix with sufficient water to produce mortar of proper consistency for pointing.
- .9 Re-temper mortar only within two hours of mixing, when water is lost by evaporation.
- .10 Use mortar within 1 1/2 hours after mixing when the air temperature is 25 degrees C or higher, and within 2 1/2 hours after mixing when the air temperature is less than 25 degrees C.
- .9 Grout Mixes:
 - .1 Bond Beams: grout mix 20 MPa strength at 28 days; 200-275 mm slump; premixed type in accordance with CSA-A23.1
 - .2 Lintels: grout mix 20 MPa strength at 28 days; 200-250 mm slump; premixed type in accordance with CSA-A23.1.
 - .3 Grout: Minimum compressive strength of 20 MPa at 28 days. Maximum aggregate size and grout slump: CSA A179.
- .10 Grout Mixing:
 - .1 Mix batched and delivered grout in accordance with CSA-A23.1 transit mixed.
 - .2 Mix grout ingredients in quantities needed for immediate use in accordance with CSA A179 fine grout.
 - .3 Add admixtures in accordance with manufacturer's instructions; mix uniformly.
 - .4 Do not use calcium chloride or chloride based admixtures.
- .11 Mix Tests:
 - .1 Testing Mortar Mix:
 - .1 Test mortar in accordance with CSA A179, for mortar based on proportion specification. Test prior to construction and during construction for:
 - .1 Compressive strength.
 - .2 Consistency.
 - .3 Mortar aggregate ratio.
 - .4 Sand/cement ratio.
 - .5 Water content and water/cement ratio.

- .6 Air content.
- .7 Splitting tensile strength
- .2 Testing Grout Mix:
 - .1 Test grout in accordance with CSA A179, for grout based on proportion specification. Test prior to construction and during construction for:
 - .1 Compressive strength.
 - .2 Sand/cement ratio.
 - .3 Water content and water/cement ratio.
 - .4 Slump.

2.3 GALVANIZING

- .1 The following galvanizing requirements apply to steel anchors, ties, reinforcing and accessories where requirements are not otherwise specifically listed:
 - .1 Ties and Reinforcing:
 - .1 Mill Galvanized (Interior Use): In accordance with ASTM A116, Class 3
 - .2 Hot Dip Galvanized (Exterior, including inner wythe of exterior wall construction and High Humidity Use): In accordance with ASTM A153/A153M, Class B-2.
 - .2 Hot Dip Hardware and Bolts: In accordance with ASTM A153/A153M, Class B-2 regardless of location.
 - .3 Hot Dip Sheet Steel: In accordance with ASTM A653/653M, Coating Designation Z600, regardless of location.
 - .4 Structural Shapes and Pipes: In accordance with ASTM A123/A123M, Grade 85, regardless of location.

2.4 REINFORCEMENT

- .1 Bar reinforcement: Steel to CAN/CSA A371 and CSA G30.18, Grade 400 W; having recycle content eligible for contribution towards LEED Certification.
- .2 Masonry Joint Reinforcement: In accordance with to CAN/CSA A371 and ASTM A1064/A1064M, with corrosion protection in accordance with CSA S304 and CSA A370, and as follows:
 - .1 Interior Walls: Mill galvanized, carbon steel.
 - .2 Exterior Walls: Hot dip galvanized, carbon steel.
 - .3 Wire Size for Side Rods: W1.7 or 3.8 mm diameter.
 - .4 Wire Size for Cross Rods: W1.7 or 3.8 mm diameter.
 - .5 Spacing of Cross Rods, Tabs, and Cross Ties: At a maximum of 400 mm o/c.
 - .6 Lengths: A minimum of 3000 mm, with prefabricated corner and tee units.
- .3 Connectors: In accordance with to CSA A370 and CSA S304 with hot dip galvanized finish.

2.5 TIES AND ANCHORS

- .1 Ties and anchors specified in this section shall be designed in accordance with CSA A370 for non-conventional masonry connectors as follows:
 - .1 Deflection: Maximum 2 mm, including free play, when acted upon by a lateral load of 0.45 kN, in all possible positions of adjustment.
 - .2 Positive restraint at position of maximum adjustment.
 - .3 Free play of multi-component ties maximum 1.2 mm when assembled in all possible configurations.
 - .4 Anchors shall allow vertical adjustment but resist tension and compression forces perpendicular to plane of wall.
- .2 Lateral Partition Supports (Top of Wall Anchors):
 - .1 Angle Support: Fabricated from 2.657 mm core metal thickness angled steel plate having 75 mm long legs fastened to deck structure to allow vertical movement of masonry assembly; mill galvanized; coordinate with Section 07 84 00 - Firestopping and Smoke seals for firestopping insulation and smoke seals.
 - .1 Basis-of-Design Materials:
 - .1 PTA 422, Blok Lok.
 - .2 Plate Support: Fabricated from 2.657 mm core metal thickness steel plate with 10 mm diameter metal 150 mm long welded to plate having closed end plastic tube fitted over rod that allows rod to move in and out of tube; hot dip galvanized after fabrication.
 - .1 Basis-of-Design Materials:
 - .1 PTA 420, Blok Lok.
- .3 Rigid T-Intersection Anchors: Fabricate from steel bars 38 mm wide x 6 mm thick x 600 mm long with ends turned up 50 mm or with cross pins at installers option; hot dip galvanized.
- .4 Anchor Bolts: Headed or L-shaped steel bolts in accordance with ASTM A307, Grade A; with ASTM A563/A563M hex nuts and, where indicated, flat washers; hot-dip galvanized in accordance with ASTM A153/A153M, Class C.
- .5 Post Installed Anchors: Provide chemical or torque controlled expansion anchors, with capability to sustain, without failure, a load equal to six times the load imposed when installed in solid or grouted unit masonry and equal to four times the load imposed when installed in concrete when tested in accordance with ASTM E488/E488M conducted by a qualified independent testing agency, and as follows:
 - .1 Indoor Locations: Carbon-steel components zinc-plated in accordance with ASTM B633, Class Fe/Zn 5.
 - .2 Outdoor and High Humidity Locations: Alloy Group 1 or 2 stainless steel bolts complying with ASTM F593/F738M and nuts complying with ASTM F594/ASTM F836M.
 - .3 Fastening Into Solid Concrete or Solidly Grouted Installation: Two component, injectable adhesive specifically manufactured for use in installing dowels or threaded anchor rods and inserts into new or existing concrete or grout, and as follows:

- .1 Epoxy Composition: Sealed packaging containing resin, hardener, cement and water; components.
- .2 Curing Time: Rapid set, high strength and stiffness; maximum time 45 minutes at 20°C.
- .3 Basis-of-Design Materials:
 - .1 HIT HY150 System, Hilti Inc., no Substitutions Accepted.
- .4 Fastening through Hollow Wall Installation: Two component, injectable adhesive specifically manufactured for use in installing dowels or threaded anchor rods and inserts, with cylindrical mesh screen tube into new or existing masonry cavity wall, and as follows:
 - .1 Epoxy Composition: Sealed packaging containing resin, hardener, cement and water.
 - .2 Curing Time: Rapid set, high strength and stiffness; maximum time 60 minutes at 20°C.
 - .3 Basis-of-Design Materials:
 - .1 HIT HY20 System, Hilti Inc., no Substitutions Accepted.
- .6 Toggle Bolts: Tumble wing type, class and style as required for supported construction.

2.6 FLASHING

- .1 Metal Flashing: Provide metal flashing materials in accordance with Section 07 62 00 - Sheet Metal Flashing and Trim.
- .2 Coordinate supply and installation of flexible flashing materials with Section 07 27 13 - Modified Bituminous Air and Vapour Barrier, provide only materials that are compatible with acceptable materials listed in Section 07 27 13 - Modified Bituminous Air and Vapour Barrier and that form the basis of the contract.
- .3 Butyl Rubber Base Flashing: minimum 1.2 mm thick butyl sheet rubber strips.
- .4 Sheet Steel Base Flashing: minimum 0.60 mm thick, to ASTM A653/A653M, formed as detailed, galvanized with Z275 zinc coating.
- .5 Modified Bitumen Base Flashing: SBS modified sheet membrane, minimum 1.0 mm thick self-adhering type or minimum 3.0 mm thick torch-applied type.
- .6 Through Wall and Flexible Flashings: Install flexible membranes where required to maintain flow direction to divert water away from face of building envelope.
 - .1 Basis-of-Design Materials:
 - .1 Bakor Blueskin TWF, Henry Company.
 - .2 Mighty Flash, Hohmann & Banard Inc.

2.7 ACCESSORIES

- .1 Firestopping: As specified under Section 07 84 00 - Firestopping and Smoke seals.
- .2 Sealants: As specified under Section 07 92 00 - Sealants, and as follows:
 - .1 Vertical Sealant: Colour to match brick.
 - .2 Horizontal Sealant: Colour to match mortar.

- .3 Joint Filler: Control Joint Fillers: Preformed rubber, neoprene or polyvinylchloride, size and profile to suit intended application and as indicated on drawings.
- .4 Bond Breaker Strips: #15 asphalt saturated, organic roofing felt in accordance with CSA A123.3.
- .5 Cavity wall insulation in accordance with Section 07 21 13 - Board Insulation.
- .6 Air and vapour barrier membrane in accordance with Section 07 27 13 - Modified Bituminous Air and Vapour Barrier. Coordinate through wall flashings listed in this section with products that form the basis of the contract.

2.8 CLEANING COMPOUNDS

- .1 Use low VOC products in compliance with SCAQMD Rule 1168.
- .2 Compatible with substrate and acceptable to concrete masonry manufacturer for use on products.

Part 3 Execution

3.1 EXAMINATION

- .1 Verify surfaces and conditions are ready to accept work of this Section.
- .2 Examine work of other Sections upon which work of this section is dependent. Should discrepancies be found which affect the proper performance of the work of this section, do not commence work until such discrepancies have been resolved.
- .3 Perform work with minimal cutting and patching.

3.2 PREPARATION

- .1 Protect adjacent finished materials from damage due to masonry work.

3.3 APPLICATION

- .1 Manufacturer's Instructions: comply with manufacturer's written recommendations, including product technical bulletins, handling, storage and installation instructions, and datasheets.

3.4 INSTALLATION: GENERAL

- .1 Construction to conform to CAN/CSA A371.
- .2 Where mortar has started to harden at units requiring repositioning, remove and replace with fresh mortar.
- .3 Masonry horizontal and vertical joints to be 10 mm thick except where adjustments are necessary to maintain the bond pattern or to adjust coursing.

3.5 INSTALLATION: CONCRETE MASONRY UNITS

- .1 Standard concrete block units:
 - .1 Bond: running.

- .2 Jointing: concave where exposed or where paint or other finish coating is specified.
- .2 Cull out masonry units, in accordance with CSA A165 and reviewed range of colour samples, with chips, cracks, broken corners, excessive colour and texture variation.
- .3 Build in miscellaneous items such as bearing plates, steel angles, bolts, anchors, inserts, sleeves and conduits.
- .4 Construct masonry walls using running bond unless otherwise noted.
- .5 Build around frames previously set and braced. Fill behind hollow frames within masonry walls with mortar or grout and embed anchors.
- .6 Fit masonry closely against electrical and plumbing outlets so collars, plates and covers overlap and conceal cuts.
- .7 Install movement joints and keep free of mortar where indicated.
- .8 Hollow Units: spread mortar setting bed from outside edge of face shells. Gauge amount of mortar on top and end of unit to create full joints, equivalent to shell thickness. Avoid excess mortar.
- .9 Solid Units: apply mortar over entire vertical and horizontal surfaces. Avoid bridging of airspace between brick veneer and backup wall with mortar.
- .10 Ensure compacted head joints. Use full or face-shell joint as indicated.
- .11 Tamp units firmly into place.
- .12 Do not adjust masonry units after mortar has set. Where resetting of masonry is required, remove, clean and reset units in new mortar.
- .13 Tool exposed joints concave weathered/raked for interior work; strike concealed joints flush.
- .14 After mortar has achieved initial set up, tool joints.
- .15 Do not interrupt bond below or above openings.

3.6 TOLERANCES

- .1 Tolerances for standard concrete unit masonry tolerances in accordance with CSA A371, supplemented as follows:
 - .1 Maximum variation between units within specific job lot not to exceed 2 mm.
 - .2 No parallel edge length, width or height dimension for individual unit to differ by more than 2 mm.
 - .3 Out of square tolerance not to exceed 2 mm.

3.7 INSTALLATION: CONNECTORS AND REINFORCEMENT

- .1 Supply and install masonry connectors and reinforcement in accordance with CSA A370, CAN/CSA A371, CSA-A23.1 and CSA-S304.1 unless indicated otherwise.
- .2 Prior to placing concrete mortar or grout, obtain Consultant's approval of placement of reinforcement and connectors.

- .3 Supply and install additional reinforcement to masonry as indicated and as required for seismic loads in accordance with building code requirements.

3.8 REINFORCED LINTELS AND BOND BEAMS

- .1 Reinforce masonry beams, masonry lintels and bond beams as indicated.
- .2 Place and grout reinforcement in accordance with CSA-S304, CAN/CSA A371, and CSA A179.
- .3 Support and position reinforcing bars in accordance with CAN/CSA A371.

3.9 GROUTING

- .1 Grout masonry in accordance with CSA S304.1, CAN/CSA A371 and CSA A179 and as indicated.

3.10 ANCHORS

- .1 Supply and install metal anchors in accordance with CSA A370 and CAN/CSA A371 as indicated.

3.11 LATERAL SUPPORT AND ANCHORAGE

- .1 Supply and install lateral support and anchorage in accordance with CSA A370 and as indicated.

3.12 CONTROL AND EXPANSION JOINTS

- .1 Install control and expansion joint materials in unit masonry as masonry progresses; do not allow materials to span control and expansion joints without provision to allow for in-plane wall or partition movement.
- .2 Form control joints in concrete masonry consisting of a complete vertical break free from mortar using one of the following methods:
 - .1 Break joint reinforcement at control joints, but extend bond beam reinforcing 400 mm into wall across control joint and wrap with 0.15 mm polyethylene bond breaker.
 - .2 Fit bond breaker strips into hollow contour in ends of concrete masonry units on one side of control joint; fill resultant core with grout and rake out joints in exposed faces for application of sealant.
 - .3 Install preformed control joint gaskets designed to fit standard sash block.
 - .4 Install interlocking units designed for control joints; install bond breaker strips at joint; keep head joints free and clear of mortar or rake out joint for application of sealant.
 - .5 Install temporary foam plastic filler in head joints and remove filler when unit masonry is complete for application of sealant.
 - .6 Refer to Drawings for control and expansion joint locations, and vertical reinforcing requirements; confirm location with Consultant before installation; confirm with Consultant where not shown on Drawings.

3.13 FIELD BENDING

- .1 Do not field bend reinforcement and connectors except where indicated or authorized by Consultant.

- .2 When field bending is authorized, bend without heat, applying a slow and steady pressure.
- .3 Replace bars and connectors which develop cracks or splits.

3.14 INSTALLATION: FLASHINGS

- .1 Build in flashings in masonry in accordance with CAN/CSA A371.
 - .1 Install flashings under exterior masonry bearing on foundation walls, slabs, shelf angles, and steel angles over openings, and at base of cavity wall and where cavity is interrupted by horizontal members or supports and as shown on drawings. Install flashings under weep hole courses and as indicated.
 - .2 In cavity walls and veneered walls, carry flashings from front edge of exterior masonry, under outer wythe, then up backing not less than 150 mm, and as follows:
 - .1 For masonry backing embed or bond flashing 25 mm in joint.
 - .2 For concrete backing, insert or bond flashing into reglets.
 - .3 For wood frame backing, staple flashing to walls behind water resistive paper, and lap joints.
 - .4 For gypsum board and glass fibre faced sheathing backing, bond to wall using manufacturer's recommended adhesive.
 - .3 Lap joints 150 mm and seal with adhesive.
- .2 Form flashing (end dams) at lintels, sills and wall ends to prevent water from travelling horizontally past flashing ends.
- .3 Install vertical flashing where outer veneer returns at window or door jambs, to prevent contact of veneer with inner wall.

3.15 REPAIR/RESTORATION

- .1 Upon completion of masonry, fill holes and cracks, remove loose mortar and repair defective work.

3.16 FIELD QUALITY CONTROL

- .1 Site Tests, Inspection: as follows:
 - .1 Concrete masonry units will be sampled and tested by independent testing agency appointed and paid by Owner in accordance with CSA S304.1.
 - .2 Notify inspection agency minimum of 24 hours in advance of requirement for tests.

3.17 CLEANING

- .1 Concrete Unit Masonry:
 - .1 Progress Cleaning:
 - .1 Standard Concrete Unit Masonry:
 - .1 Allow mortar droppings on masonry to partially dry then remove by means of trowel, followed by rubbing lightly with

small piece of block. Clean wall surface with suitable brush or burlap.

- .2 Upon completion of installation, remove surplus materials, rubbish, tools and equipment barriers.
- .3 Waste Management: separate waste materials for reuse and recycling in accordance with Section 01 74 19 – Construction Waste Management.

END OF SECTION

Part 1 General

1.1 Definitions

- .1 The following Definitions shall apply in this Specification
- .2 Contract Documents
 - .1 The Contract Documents consist of the Drawings, Specifications and Reports which form part of the agreed Contract.
- .3 Consultant
 - .1 The Consultant is the Architect, SEOR, persons or entities engaged by the Owner. The term Consultant means the Consultant or the Consultant's authorized representative.
- .4 Contractor
 - .1 The term Contractor is defined to include any of the following: Construction Manager, General Contractor, Structural Steel Erector, Structural Steel Fabricator, Subcontractor or Supplier.
- .5 Owner
 - .1 The Owner is the person or entity identified as such in the Contract. The term Owner means the Owner or the Owner's authorized agent or representative, but does not include the Consultant.
- .6 SEOR
 - .1 The SEOR is defined as the Structural Engineer of Record for the Contract.

1.2 WORK INCLUDED

- .1 Comply with Division 1 - General Requirements and all documents referred to therein.
- .2 Provide all labour, materials, plant and equipment to complete the structural steel Work indicated in the Contract Documents and specified in this Section.
- .3 It is the responsibility of the Contractor to verify the availability of the steel sections specified in the Contract Documents at time of tender, and to immediately notify the Consultant if any of the steel sections are not readily available and need to be substituted. Substitutions made after tender will be at the expense of the Contractor.
- .4 It is the responsibility of the Contractor to verify that steel members which are shown to be curved or cranked in the Contract Documents, can be fabricated as shown without any reduction in the load carrying capacity of the member. If curved or cranked steel members cannot be fabricated as shown in the Contract Documents, the Contractor shall identify, at the time of tender, which steel members cannot be fabricated as shown in the Contract Documents, and to propose alternative steel sections for consideration by the Consultant. Any cost

associated with any alterations to such members identified after tender will be at the expense of the Contractor.

1.3 RELATED WORK SPECIFIED ELSEWHERE

- .1 Concrete Reinforcement, Section 03 20 00
- .2 Cast-in-Place Concrete, Section 03 30 00, Grouting beneath column bases and bearing assemblies on concrete members–.
- .3 Cast-in-Place Concrete: Section 03 30 00 – Cast-in-Place Concrete.
- .4 Steel Deck, Section 05 31 00, Reinforcement of edges of openings in steel deck that are not larger than 450 mm in roof deck and 300 mm in floor deck
- .5 Painting, Section 09 91 00

1.4 REFERENCE STANDARDS, CODES AND ACTS

- .1 Conform to the requirements of the local building code identified on the Structural General Notes as amended by all subsequent Regulations issued to the date of this Specification and applicable acts of authorities having jurisdiction.
 - .1 All references to the Standards and publications noted below shall be to the edition referenced in the local building code identified on the Structural General Notes, or to the edition referenced in the latest published editions or revisions of all Standards published by the Canadian Standards Association issued to the date of this Specification, whichever is the later edition or revision.
 - .2 All references noted below, which are not referenced by the local building code or the Standards published by the Canadian Standards Association, shall be to the latest edition and revision published to the date of this Specification.
 - .3 Standards and publications referenced by the Standards noted below shall apply even if they are not included in the list. Where such reference is made, it shall be to that latest edition and revision published to the date of this Specification.
 - .4 ASTM A123/A123M - Standard Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel products.
 - .5 ASTM A143/A143M - Standard Practice for Safeguarding Against Embrittlement of Hot-Dip Galvanized Structural Steel Products and Procedure for Detecting Embrittlement
 - .6 ASTM F3125, Grade A325 - High Strength Structural Steel Heavy Hex Head Bolts, Heat Treated 825 MPa (120 ksi) minimum Tensile Strength for diameter $d \leq 1''\varnothing$ and 725 MPa (105 ksi) for diameter $d > 1''\varnothing$.
 - .7 ASTM F3125, Grade F1852 - High Strength Structural Steel Twist-Off Bolts, Heat Treated 825 MPa (120 ksi) minimum Tensile Strength for $d \leq 1''\varnothing$ and 725 MPa (105 ksi) for $d > 1''\varnothing$.

- .8 ASTM F3125, Grade A490 - High Strength Structural Heavy Hex Head Bolts, Alloy Steel Heat Treated 1035 MPa (150 ksi) Minimum Tensile Strength.
- .9 ASTM F3125, Grade F2280 - High Strength Structural Twist-Off Bolts, Alloy Steel Heat Treated 1035 MPa (150 ksi) Minimum Tensile Strength.
- .10 ASTM A6/A6M - Standard Specification for General Requirements for Rolled Structural Steel Bars, Plates, Shapes and Sheet Piling.
- .11 ASTM A53/A53M - Standard Specification for Pipe, Steel, Black and Hot-Dipped Zinc Coated, Welded and Seamless.
- .12 ASTM A108 - Standard Specification for Steel Bar, Carbon and `Alloy, Cold-Finished
- .13 ASTM A500/A500M - Standard Specification for Cold Formed Welded and Seamless Carbon Steel Structural Tubing in Rounds and Shapes.
- .14 ASTM A572/A572M - Standard Specification for High Strength Low Alloy Columbium – Vanadium Structural Steel.
- .15 ASTM A992/A992M - Standard Specification for Steel for Structural Shapes for Use in Building Framing.
- .16 ASTM F1554 - Standard Specification for Anchor Bolts, Steel 36, 55 and 105 ksi Yield Strength
- .17 ASTM F3043 Grades 1 and 2 (sizes 1" Ø, 1 ⅝"Ø and 1 ¼" Ø only) - High Strength Twist-Off Structural Bolt/Nut/Washer assemblies, Alloy Steel Heat Treated 1375 MPa (200 ksi) Minimum Tensile Strength. Limited to specific building locations and non-corrosive environmental conditions. F3043 Grade 1 assemblies may be installed only to the snug tight condition. F3043 Grade 2 assemblies may be used in snug-tight connections and may also be pre-tensioned in slip critical connections.
- .18 ASTM F3111 Grades 1 and 2 (sizes 1" Ø, 1 ⅝"Ø and 1 ¼" Ø only) - High Strength Heavy Hex Structural Bolt/Nut/ Washer assemblies, Alloy Steel Heat Treated 1375 MPa (200 ksi) Minimum Tensile Strength. Limited to specific building locations and non-corrosive environmental conditions. F3111 Grade 1 assemblies may be installed only to the snug tight condition. F3111 Grade 2 assemblies may be used in snug-tight connections and may also be pre-tensioned in slip critical connections.
- .19 ASTM F959/F959M - Standard Specification for Compressible-Washer-Type Direct Tension Indicators for Use with Structural Fasteners
- .20 ASTM F436 - Standard Specification for Hardened Steel Washers.
- .21 ASTM A563 - Standard Specifications for Carbon and Alloy Structural Nuts.

- .22 ASTM A913/A913M - Standard Specification for High Strength Low Alloy Steel Shape Quality, Procedures by Quenching and Self Tempering Process
 - .23 ASTM A1085/A1085M - Standard Specification for Cold-Formed Welded Carbon Steel Hollow Structural Sections (HSS.)
 - .24 ASTM F1136/F1136M - Standard Specifications for Zinc/Aluminum Corrosion Protective Coatings for Fasteners
 - .25 AWS D1.1/D1.1M - Structural Welding Code – Steel.
 - .26 AWS A2/1-DC - Welding Symbol Chart
 - .27 CAN/CSA G40.20/G40.21 - General Requirements for Rolled or Welded Structural Quality Steel/Structural Quality Steel
 - .28 CSA-S16 - Design of Steel Structures
 - .29 CSA-W47.1 - Certification of Companies for Fusion Welding of Steel Structures
 - .30 CSA-W48 - Filler Metals and Allied Materials for Metal Arc Welding
 - .31 CSA-W55.3 - Certification of Companies for Resistance Welding of Steel and Aluminum
 - .32 CSA-W59 - Welded Steel Construction (Metal Arc Welding)
 - .33 ISO 9002 - Model for Quality Assurance in Production and Installation
 - .34 SSPC (The Society for Protective Coatings) (formerly SSPC – Steel Structures Painting Council) Steel Structures Painting Manual
 - .35 CISC Guide for Specifying Architecturally Exposed Structural Steel, latest edition
 - .36 CISC Code of Standard Practice for Structural Steel.
 - .37 Standard Specification for Highway Bridges, American Association of State Highway and Transportation Officials (AASHTO).
 - .38 American Institute of Steel Construction (AISC) Code of Standard Practice for Steel Building and Bridges, Section 10, Architecturally Exposed Structural Steel.
 - .39 American Institute of Steel Construction (AISC) Commentary on the Code of Standard Practice for Steel Buildings and Bridges.
 - .40 American Institute of Steel Construction (AISC) supplements to the “Specification for Structural Steel for Buildings”
- .2 Where there are differences between the Contract Documents and the standards, codes or acts, the most stringent shall govern.

1.5 CISC CODE OF STANDARD PRACTICE FOR STRUCTURAL STEEL

- .1 The CISC's Code of Standard Practice for Structural Steel shall govern the Work, subject to the modifications noted below.
 - .1 Revise Clause 1.4 Responsibility for Design as follows:
 - .1 **1.4 - Responsibility for Design.** When the Owner provides the structural Drawings and Specifications, the Contractor shall not be responsible for determining the adequacy of the design nor liable for the loss or damage resulting from an inadequate design. *The SEOR shall be responsible for the overall behaviour of the structure, the sizing of steel members and their supports as required by the Building Code and the provision of connection forces indicated on the structural Drawings. The Contractor shall be responsible for the design and detailing of all connections and components, members and standardized assemblies. (See also Clause 5.6.)*
 - .2 Add the following to Clause 1.5, Responsibility for Erection Procedure:
 - .1 **1.5 - Responsibility for Erection Procedure.** The Contractor shall ensure that in the event the Fabricator's contract does not include the erection of the structural steel, the Erector shall be responsible for determining the erection procedure, for checking the adequacy of the connections for the uncompleted structure, for providing erection bracing or connection details and for coordinating the erection of the steelwork with the Fabricator.
 - .3 With respect to Clause 3.3 Revisions to the Contract Documents, revise Clause 3.3.4 as follows:
 - .1 **3.3.4 -** Unless specifically stated to the contrary, the issue of revision documents or changes indicated on submittal reviews is not authorization by the Owner to release these revisions for construction. Any and all revisions to the Contract shall be made in accordance with the provisions set out in the Contract Documents, and will be based on the Contractor's assessment of the impact of the proposed revisions on the Contract Price and schedule for completion of the Work.
 - .4 Revise Clause 3.4, Discrepancies as follows:
 - .1 **3.4 - Discrepancies.** In case of discrepancies between Contract Documents, the provisions of Standard Construction Document – CCDC2-2008 shall govern, unless agreed or instructed otherwise. In case of discrepancies between the structural documents and Documents of other Sections, the documents for the Section responsible for deriving the required information shall govern.
 - .5 Revise Clause 4.1.1 as follows:

- .1 4.1.1 - At the time tenders are called, the Contractor shall receive a complete set of the Contract Documents (*including Drawings and Specifications*) for all design disciplines and specialty Consultants engaged on the project. When appropriate, these documents shall include complete structural Drawings, conforming to the requirements for design drawings of the governing technical standard. Structural steel Specifications should include any special requirements controlling the fabrication and erection of the structural steel, surface preparation and coating, and should indicate the extent of non-destructive examination, if any, to be carried out.
- .6 Clause 4.1.2, delete the last two words in the last sentence.
- .7 Revise Clause 4.2 as follows:
 - .1 4.2 - **Architectural, Mechanical, Electrical and Additional Specialty Consultants Drawings.** Architectural, mechanical, electrical and additional specialty Consultants Drawings may be used as a supplement to the structural Drawings to define detail configurations and construction information.
- .8 Revise Clause 5.6 as follows:
 - .1 5.6 - **Review of Fabrication and Erection Documents.** Erection diagrams, standard and non-standard connection design details, shop details and fieldwork details shall be submitted for review by the SEOR in accordance with the provisions of the Contract Documents. The submittals will be reviewed and returned in accordance with the provisions of the Contract Documents. The documents will be reviewed on a sampling basis for general conformity with the Contract Documents only. The SEOR's review does not relieve the Contractor, Fabricator, Erector or their engineer(s) of any responsibility for same. (Note: The remainder of this clause, as noted in the Code of Standard Practice, is to be deleted.)
- .9 Revise Clause 6.7 as follows:
 - .1 6.7 - **Inspection of Steelwork.** Should the Owner wish to have an independent inspection and/or non-destructive examination of the steelwork, they shall reserve the right to do so in the Contract Documents. The Contractor shall notify the inspection and testing company of the progress of the Work so that timely inspection and testing may be arranged. The cost of this inspection and testing is the responsibility of the Owner. However, deficiencies in the Work of the Contractor requiring re-inspection and re-testing due to the frequency of the deficiency shall be the responsibility of the Contractor.

1.6 TOLERANCES

- .1 Fabricated members and erected structural steel tolerances shall conform to the ones specified in the typical details and CSA-S16.
- .2 Interfacing tolerances may not be compatible with the above. Review and coordinate interfacing tolerances so that the various elements come together properly.
- .3 Fabricating, shall be such that the effects of galvanizing, bending, cambering and the like, on the alignment of the completed members is minimized.

1.7 QUALIFICATIONS

- .1 Any organization undertaking to weld shall be certified by the CWB to the requirements of Division 1, or Division 2.1 of CSA-W47.1.
- .2 The Contractor shall ensure that the potential steel Subcontractors can successfully demonstrate that they have sufficient relevant experience of Work similar in size, scope, complexity and risk to that shown on the Contract Documents and described in this Section.
- .3 Design calculations shall be carried out by or under the direct supervision of a qualified Professional Engineer licensed in the Province having jurisdiction, with a minimum of 5 years Canadian experience in the design of structural steelwork, connections including design of weldments, or joist systems, as appropriate.
- .4 The Contractor shall ensure that engineers responsible for welding design, procedures and practice are certified in accordance with CSA W47.1, section 6.1.
- .5 The Contractor shall ensure that professional Engineers responsible for the design of steelwork, connections, joist systems and the like, are insured in accordance with section 74(1) of Regulation 941 of the Ontario Professional Engineers Act or shall be covered under the Contractor's General Liability Insurance Policy. Note: If the professional engineer is insured in accordance with Regulation 941 of the Ontario Professional Engineers Act, the alternative outlined in section 74(2) is not acceptable.

1.8 DESIGN

- .1 General
 - .1 Design connections for the loads indicated or implied in the Contract Documents in accordance with requirements of CSA-S16.
 - .2 If the Contractor requires additional information or clarification to aid in the design of the Work, this information shall be requested in a timely manner.
- .2 Connections
 - .1 The Contractor shall be solely responsible for the design and detailing of all connections between the steel members including, but not limited to

columns, beams, girders, trusses and braces, and between such members as spandrel angles and beams, hangers, stiffeners, etc., and their supporting members.

- .2 The Contractor shall also be responsible for the design and detailing of stiffeners, doubler plates and the like required to maintain the local strength and stability of a member and where these stiffeners and doubler plates are an integral part of the connection or where they affect the connection of other steel framing members. Examples include cranked sections, moment connections between columns and beams, connections to hollow structural sections and the like. Where connections are exposed to view, the detailing of stiffeners, double plates and the like is subject to review by the Consultant.
- .3 Use types of shop or field connections shown on the Contract Documents, or in the absence of such information, use the most appropriate type of connections given the applied loads and the arrangement of members.
- .4 Design connections to safely withstand the combined primary effects of axial force, shear, moment and torque and any secondary effects due to welding. Connections shall also safely withstand any temporary loads which may occur during the construction.
- .5 Shear connections shall not be less than one half the depth of the connected member.
- .6 Where no axial force is indicated for beam to column connections, connect beams framing into columns such that the combined capacities of the connection are able to resist a total horizontal force of 2% of the factored axial load in the column, in any direction. The column bracing force shall be proportioned and resisted by the members framing into the joint according to their relative axial stiffnesses, unless noted otherwise in the Contract Documents.
- .7 Unless noted otherwise in the Contract Documents, the design of all beams and girders is based on the assumption that fastener holes through flanges will not exceed 15% of the gross flange area. If the area of holes exceeds 15%, the member size shall be altered or reinforced accordingly. Documentation noting the alteration is to be submitted for review.
- .8 Design bracing member connections for field adjustability to accommodate maximum construction tolerances and to achieve bracing preloads where specified in the Contract Documents.
- .9 Design hanger connections where bolts are loaded in tension such that they may be locked after pretensioning.
- .10 Design connections for fastening together double angles, double rectangular plates or bars, and the like, used to resist compression, tension, or bending in such a way that the slenderness ratio of any

component, based on its least radius of gyration and the distance between interconnections, shall not exceed that of the built-up member. As a minimum, provide two intermediate battens or spacers along the length of all members.

- .11 The following types of connections are to be designed as slip-critical connections:
 - .1 Connections that utilize oversized holes;
 - .2 Connections that utilize slotted holes, except those where the applied load is normal to the long dimension of the slot.
 - .3 Connections subject to fatigue or frequent load reversal; and
 - .4 Connections where slippage cannot be tolerated, including;
 - .1 All moment connections (unless end plate type moment connections are used);
 - .2 Connections where welds and bolts share in transmitting shear forces at a common faying surface.
- .12 Bolts in the following types of connections are to be pretensioned in accordance with the requirements of S16;
 - .1 Slip-critical connections,
 - .2 Connections governed by seismic requirements,
 - .3 Connections for all elements resisting crane loads,
 - .4 Connections for members directly supporting running machines or other live loads that produce impact or cyclic load,
 - .5 Connections where bolts are subject to tensile loads.
 - .6 Connections using oversized or slotted holes unless specifically designed to accommodate movement.
- .13 Design connections that are exposed to weather so that moisture and foreign matter cannot be trapped or gain entry to the interior of hollow built up members.
- .14 Design connections that are susceptible to the accumulation of moisture so that moisture and foreign matter cannot be trapped within the connectors or members framing into the connection.
- .15 Design and detail connections so they do not encroach upon architectural clearance lines or finishes.
- .16 Where connections between beams and columns and the like result in a loss of bearing for the steel deck, design and provide support for the steel deck, as required.

- .17 Design and provide end bearing connections of inclined members such that the bearing plane between the inclined members and their supporting members is horizontal.
- .18 Design connections to cast in plates to provide for the maximum deviation that can occur in erection and based upon the following:
 - .1 Specified steel erection tolerances,
 - .2 Maximum permissible tolerances in the location of inserts cast into concrete, specified in Section 03 10 00 – Concrete Forming.
 - .3 Joists
 - .4 Design joists and anchorages for the loads indicated in the Contract Documents and CSA S16.
 - .5 Bracing and bridging shown on the Drawings is intended as a guideline only. Design and provide bracing and bridging as per the requirements of CSA S16.
 - .6 Design joist shoes based on the loads and assumed shoe depths noted on the Drawings. If joist shoes of different depths are provided, the Contractor is responsible for any and all revisions this may have on top of steel elevations and the like.
 - .7 Design the first compression web member subject to transverse shear, and its connections, at each end of joists, in accordance with CSA S16 Cl 16.5.7.3.
 - .8 Design roof joists, bridging and anchorages to safely resist net uplift forces indicated in the Contract Documents and, in any event, a minimum of 0.5 kPa.
 - .9 Design roof joists so that the joist stiffness is at least twice the critical stiffness defined in Commentary H, Equation (1) of the User's Guide - NBC 2010, Structural Commentaries (Part 4 of Division B).
 - .10 Design joists and connection to joists to safely resist horizontal forces introduced into top chords of joists by horizontal cross-bracing shown on the Drawings.
 - .11 Design and connect joists to furnish lateral support to the chords or flanges of supporting steel members. Design joists with joist bearing points offset (in plan), such that their reaction is transferred to the centerline of the supporting member. For joists exposed to view, design joists to frame into the supporting member at the same location, with a maximum gap between the ends of adjacent joists of 20 mm.
 - .12 Provide tie joists for all joists framing into columns, unless noted otherwise on the Drawings. Where tie joists frame into columns, extend top and bottom chords and connect to columns to safely

develop one percent of column axial load but not less than 25 kN in tension or compression.

- .13 Design anchorage of each line of bridging to abutting walls and other supporting structural steel members to safely resist forces indicated in the Contract Documents, or to at least develop the safe capacity of the bridging members in tension.
- .14 Limit roof joist deflection due to specified live loads to $L/360$ of span.
- .15 Where joists span parallel to load bearing walls, limit joist deflection to $2L/360$ of span, where L is measured perpendicular to the load bearing wall, from the centerline of the joist to the load bearing wall.
- .16 Design joists supporting masonry partitions so the deflection, when subjected to full live load, shall not exceed $L/600$, where L is the span of the supporting joists.
- .17 Design joists supporting moveable partitions so that the deflection when subjected to full live load including partitions stacked at any point, or fully extended shall not exceed that required by the manufacturer of the moveable partition.
- .18 Camber joists in accordance with the provisions of S16 unless noted otherwise in the Contract Documents.
- .19 Adjust stiffness and required camber of joists adjacent to masonry walls, columns, steel beams of shorter span, other joists with different loading or stiffness characteristics and the like to permit the proper fastening of the steel deck. As a guide, limit the deflection of the adjacent joist, under all dead loads, to $L/120$, where L is the span of the steel deck perpendicular to the joists.
- .20 Where ducts or services pass through joists, design and locate web members and bridging connections to accommodate the sizes and runs of ducts and services shown.

.3 Colour Coding

- .1 When different grades of steel are supplied, use a colour coding technique to aid in the shop and field identification of these different grades. Each member used shall bear its particular colour code as required by G40.21.

1.9 SUBMITTALS

.1 Quality Control Program

- .1 Include with the tender documents a copy of Fabricators and Erectors standard Quality Control Program.

- .1 Prior to commencement of the Work, the complete Quality Control Programs of the Fabricator and Erector, specific to the project, are to be submitted for review by the Consultant.
- .2 Qualifications of Professional Engineer
 - .1 Submit appropriate documentation for each professional engineer who will be responsible for the steelwork; including the erection and design of connections, weldments, joist systems and the like, verifying the minimum qualification requirements outlined in this specification.
- .3 Proof of Insurance
 - .1 Submit proof of adequate insurance coverage for each professional engineer who will be responsible for the steelwork, connections, joist systems and the like.
- .4 Shop Drawings
 - .1 General
 - .1 The Contractor shall ensure that professional engineer(s) responsible for the structural steelwork, connections, joist systems and the like shall either:
 - .1 Seal and sign all necessary shop drawings, or
 - .2 Submit a sealed and signed letter prior to commencement of shop drawing preparation stating that they have been retained by the steel Fabricator to carry out the design of steel connections, joist systems and the like AND shall submit a second letter after shop drawing preparation is complete stating that the design of the steelwork, for which they are responsible, has been completed in accordance with the Contract Documents and relevant building codes, standards and acts.
 - .2 Unless noted otherwise in the Contract Documents, provide adequate space on all shop drawings immediately above the drawings title block for the Consultant's Shop Drawing review stamp. Where requested by the Consultant, the stamp is to be inserted by this section directly into the shop drawing prior to submission. The stamp shall be positioned in the same location on each shop drawing, and in no case shall the allocated space be less than 63 mm x 75 mm. Request the details of these requirements from the Consultant no less than 2 weeks before the commencement of shop drawings.
 - .3 If the professional engineer(s) choose to seal and sign the shop drawings, as noted above, all shop drawings must be sealed and signed, except for erection diagrams which only contain design information (member sizes, forces, loads and the like) which is indicated on the Contract Documents. If any fieldwork details,

notes to the Erector or notifications are made on the erection diagrams, then they must be sealed and signed by the Contractor's engineer.

- .4 The structural Drawings shall not be reproduced in whole or in part, for use as shop, erection or setting drawings.
- .5 Well in advance of fabrication; submit structural steel connection design details shop, erection, and setting drawings for review by the Consultant. Submit fieldwork details for review by the Consultant.
- .6 Shop drawings shall be submitted for all structural steel Work and shall be submitted in complete packages so that individual parts and the assembled unit can be reviewed together. This section and the applicable drawings used in the development of the shop drawings shall be clearly referenced on each shop drawing to facilitate review. Detail member marks shall be cross referenced on the erection drawings to facilitate a quick identification of the members.
- .7 When shop drawings are revised and resubmitted, all revisions to the drawings shall be clearly identified by means of "bubbles", "clouds" or other obvious means.
- .8 All shop drawings submitted must clearly indicate the initials of the individual who checked the shop drawings before they were submitted for review.
- .9 Submit a 3D digital model (Tekla or REVIT) with each submission of erection or detailed piece drawings.
- .2 Connection Design Details
 - .1 Submit connection design details for review by the Consultant, prior to the submission of the detailed piece drawings.
 - .2 Connection design details shall be submitted for all standard and non-standard connections, and shall be referenced to the structural Drawings.
- .3 Erection Drawings
 - .1 Submit erection drawings for review prior to preparation of detailed piece drawings.
 - .2 Erection drawings shall be included with each submission of detailed piece drawings, connection details and calculations.
 - .3 Erection drawings shall clearly indicate or highlight the member marks that are being submitted for review.
 - .4 Erection drawings shall clearly show all setting out dimensions for the structural steel frame, including dimensions that have been

confirmed by Site measurement. Dimensions shall be tied to relevant grid lines or reference points.

- .5 Indicate on erection diagrams steel lintels and other structural shapes which are embedded in masonry or cast-in-place concrete and not connected to structural steel.
- .6 Erection drawings shall clearly show all AESS members and their respective Category.
- .7 When erection drawings are being submitted for “marks only” or for “reference only”, this shall be clearly indicated on the drawings or transmittal.

.4 Detailed Piece Drawings

- .1 Submit detailed piece drawings for all structural members.
- .2 As a minimum, show the following:
 - .1 layout;
 - .2 member sizes;
 - .3 connection details, including appropriate reference to connection design calculations;
 - .4 splice locations and details;
 - .5 truss details;
 - .6 holes;
 - .7 camber;
 - .8 finishes;
 - .9 grades of steel;
 - .10 bolt material and sizes;
 - .11 weld details, sizes and grade of electrodes;
 - .12 identify location and extent of all pretensioned bolts, slip critical bolts and class of surface preparation;
 - .13 clearly identify locations and details of all slip critical connections;
 - .14 architectural clearance lines and finishes where connections and the like may encroach with other Work.
- .15 Submit joist shop drawings for review by the Consultant.
- .16 As a minimum, show the following:
 - .17 specified design loads;
 - .18 material Specifications;
 - .19 member sizes;

- .20 dimensions;
 - .21 spacers;
 - .22 welds;
 - .23 joist shoes and related details;
 - .24 anchorages;
 - .25 bracings;
 - .26 bearings;
 - .27 field splices;
 - .28 bridging locations;
 - .29 camber;
 - .30 joist properties, including frequency, for checking floor vibration; and
- .5 Fieldwork Details
- .1 Submit details for all fieldwork in accordance with the requirements of Division 1 – General Requirements.
 - .2 The location of fieldwork details shall be clearly identified or referenced on the erection drawings.
 - .3 Prepare setting drawings showing dimensions and details for setting structural steel bearings, anchorages, assemblies and the like where they interface with other building components.
 - .4 Co-ordinate structural steel shop and erection drawings with shop drawings of other interfacing Work.
 - .5 Submit all non-prequalified welding procedures, stamped as approved by the Canadian Welding Bureau and correlated to the appropriate shop and erection drawings.
 - .6 Submit details of the method proposed to achieve and verify the specified tension to bracing members within the specified tolerances.
 - .7 Furnish inspection company with a copy of each shop, erection, and setting drawing bearing the Consultant's shop drawing stamp marked reviewed.
- .6 As-Built Drawings
- .1 Mark on a complete set of final drawings any changes, additions, or deletions that occur during construction as a result of the Contractor's Work, change orders or for any other reason.

- .2 For all shop drawings marked “Reviewed as Noted” or “Revise and Resubmit”, update and submit a record set of these drawings at the completion of the structural Work. Ensure that these drawings reflect the changes and are coordinated with the final drawings noted above.
 - .7 Submit a 3D digital model (Tekla or REVIT) with each submission of erection or detailed piece drawings.
- .5 Surveys
 - .1 Preconstruction Survey: Where interface with existing construction occurs, the existing construction shall be surveyed and such survey submitted before related shop drawings are prepared.
 - .2 Work by Others: Examine all Work prepared to receive Work of this Section and report any defects affecting installation to the Consultant for correction. Commencement of Work will be construed as complete acceptance of preparatory Work by others. This Section alone shall be responsible for checking of the dimensions and coordination of the structural steel Work with the Work of other Specification Sections.
 - .3 Submit surveys showing position of structural steel members. Submit survey results on any given floor before concrete is placed on the floor. As a minimum include the following:
 - .1 Location of centreline of all columns with respect to grids at each floor level;
 - .2 Elevation of tops of girders, joists, trusses and beams at ends, midspan and at cantilevered ends, at all floors and roof, before and after placing of concrete.
- .6 Calculations
 - .1 Submit calculations bearing the seal and signature of the qualified Professional Engineer licensed in the Province having jurisdiction and such further proof as may be necessary to show that non-standard connections and steel joist systems and the like conform to the requirements set forth in this section.
- .7 Cambering Procedures
 - .1 Submit detailed cambering procedures for beams, girders, trusses, joists and the like for review prior to start of fabrication.
- .8 Erection Procedures
 - .1 Erection procedures and erection bracing are the sole responsibility of the Contractor.
 - .2 Well in advance of erection, submit procedures, methods, sequences of erection, temporary shoring, guying, erection bracing and equipment proposed for use in erecting structural steel. The erection procedure shall

be supplemented by drawings and sketches to identify the location of the stabilizing elements. The procedure shall bear the seal and signature of the qualified licensed Professional Engineer licensed in the Province having jurisdiction.

.9 Substitution

- .1 It is the Contractor's responsibility to verify the availability of the steel sections shown on the structural Drawings at time of tender, and to immediately notify the Consultant if any of the sections are not readily available and need to be substituted. Substitutions after the time of tender will be at the cost of the Contractor.
- .2 If the Contractor wishes to make other substitutions for steel materials or sizes indicated in the Contract Documents, submit proposals with the tender including calculations for review by the Consultant.

.10 Mill Test Certificates

- .1 Submit to the Consultant copies of mill test certificates covering chemical and physical properties of steel used in this Work, including mill test reports for all structural bolts, a minimum of 4 weeks prior to commencing fabrication.

.11 Colour Code

- .1 Submit colour code proposed or other agreed methods to identify various grades of structural elements.

.12 Non-destructive Testing

- .1 Submit all in-house non-destructive testing results of shop and field Work together with inspector/technician certification status and test procedures used.

Part 2 Products

2.1 MATERIALS

- .1 Provide only new material manufactured in North American mills free from defects impairing strength and durability. New materials shall be in accordance with the Standards referenced in this Section. Where sections identified are not available from the mills noted or where the Contractor chooses to use sections produced by other mills, provide new materials of minimum strength and minimum quality as indicated in the Contract Documents. For sections that are not produced by North American mills, the Contractor shall submit written requests for review of the alternate mill to the Consultant before proceeding with material procurement. The Consultant reserves the right to require physical test data (in addition to the mill test reports) proving that the steel from the proposed mill meets the requirements specified in the Contract Documents. Provide such data for each 100 tonnes of material supplied.
- .2 Structural Steel:

- .1 Structural wide flange shapes (W) to conform to CAN/CSA-G40.20/G40.21 grade 350W.
- .2 Structural welded wide flange shapes (WWF) to conform to CAN/CSA-G40.20/G40.21 grade 350W.
- .3 Angles, plates and channels (L, C) to conform to CAN/CSA-G40.20/G40.21 grade 300W.
- .4 Hollow structural sections (HSS) to conform to CAN/CSA-G40.20/G40.21 grade 350W.
- .3 Anchor Rods: Conform to 300W threaded rod conforming to CSA G40.21-M, unless noted otherwise in the Contract Documents.
- .4 Bolts, Nuts and Washers: Conform to ASTM F3125. Galvanized A325 bolts over 22mm diameter shall have a dry lubricant on threads such as Johnson's Stick Wax #140 or approved equivalent before installation.
- .5 High Strength Bolts: High strength bolts shall be of Canadian or United States manufacture and shall conform to the provisions of the Research Council on Structural Connections (RCSC) "Specifications for Structural Joints Using ASTM F3125, Grades A325 & A490", latest edition.
- .6 Welded Stud Shear Connectors: Headed studs shall be manufactured by Nelson Stud Welding, Inc. (or approved equivalent) and shall be made from mild steel conforming to ASTM A108 grade 1010 through 1020. Headed studs shall be welded per manufacturer's recommendations; mechanical properties of headed studs shall be in accordance with AWS D1.1.
- .7 Deformed Bar Anchors: Shall be Nelson, flux filled deformed bar anchors, type D2L, or approved equivalent.
- .8 Shop Paint/Primer:
 - .1 The shop primer or paint shall be compatible with spray fireproofing, intumescent paint and/or the top coat paint system specified in the Contract Documents or elsewhere, where applicable.
 - .2 Shop Paint: To CISC/CPMA 1-73a or SSPC Paint 15.
 - .3 Shop Primer: To CISC/CPMA Standard 2-75.
- .9 Minimum coating thickness for Hot Dip Galvanizing shall conform to ASTM A123/123M.
- .10 Inorganic Zinc-Rich Primer: Zinc Clad II as supplied by The Sherwin-Williams Company (2 to 4 mils dry film thickness), or approved equivalent.
- .11 Organic Zinc-Rich Primer: Zinc Clad 200 as supplied by The Sherwin-Williams Company (3 to 5 mils dry film thickness), or approved equivalent.

- .12 Epoxy Paint: Macropoxy 646 Fast Cure Epoxy as supplied by Sherwin-Williams Company (4 to 6 mils dry film thickness) or approved equivalent.
- .13 Zinc-Rich Touch-up Paint: Zinc Clad 5 as supplied by The Sherwin-Williams Company) or approved equivalent.

Part 3 Execution

3.1 FABRICATION

- .1 Prior to fabrication of structural steel, take field measurements where connections are to be made to existing Work, open up all areas to allow the installation of the new structural Work, as well as the connection of new Work to the existing Work. Take any and all necessary field measurements. Modify installation methods and methods for connecting to suit Site conditions found and to the approval of the Consultant.
- .2 Provide holes up to 12 mm in diameter, as required, to permit the attachment of other materials. Ensure cross sectional area of section is not reduced by more than 10% at any point on its length.
- .3 Provide 20 mm ($\frac{3}{4}$ ") drain holes in closed sections to prevent water build-up during erection. Ensure drain holes remain free to drain throughout construction and are not plugged by subsequent construction activities.
- .4 Splices, other than those shown in the Contract Documents, shall not be permitted in members without the Consultant's approval. If approval is given to permit welded splices, they shall be non-destructively tested at no extra cost to the Owner.
- .5 Unless noted otherwise in the Contract Documents, provide a 10 mm cap plate for all hollow members. Provide continuous seal weld around cap plate.
- .6 Seal all hollow built-up members exposed to weather with continuous seal welds, incorporating structural welds where indicated in the Contract Documents or as required.
- .7 Where masonry walls are shown built into structural steel columns and beams in the Contract Documents, provide and install masonry anchors on columns at 600 mm on centres and anchors on beams at 1500mm on centres.
- .8 Thickness of baseplates 100 mm or greater is nominal and allows for a maximum reduction of 6 mm for milling to the requirements of CSA S16. Identify grade of steel for these plates which may not conform to clause 2.1.2.3
- .9 Cambers
 - .1 Provide the camber indicated in the Contract Documents to trusses, joists, beams and girders in such a manner as to provide a uniform parabolic profile. Ensure that the method used to provide camber does not reduce the safe load carrying capacity or cause distortion of the members.
 - .2 Camber stated on the Drawings is the required camber after erection.

.10 Openings

- .1 Conform to the requirements indicated in the Contract Documents for location, size, and reinforcement of openings through structural steel.
- .2 No openings other than those indicated on the structural Drawings will be permitted without the Consultant's approval.

.11 Bending Steel Sections

- .1 Bend sections to the geometry noted on the Contract Documents in such a manner as to provide a smooth uniform profile. Ensure that the method used to bend the steel sections does not reduce the safe load carrying capacity or cause distortion of the members.

.12 Cutting of Heavy Sections

- .1 Where ASTM A6/A6M Groups 4 or 5 rolled shapes or plates 50 mm or thicker are to be jointed by partial or full penetration welds in tension, preheating shall be required for all thermal cutting operations. Preheat shall be sufficient to prevent cracking but in no case less than 65°C. Weld access holes and copes shall be ground to a smooth radius after cutting and testing for cracks by the magnetic particle method. All cut edges shall be free of sharp notches and gouges.

.13 Holes & Cutting

- .1 All holes shall be accurately drilled or punched. Burning or drifting unfair holes will not be permitted. Holes that must be enlarged shall be reamed. Holes for the attachment of Work by other Sections shall be provided as required. Drift pins shall be allowed only to bring together the several parts for connection.
- .2 Holes shall be provided in members to permit connections to the Work of other Sections or contracts.
- .3 The use of manual gas-cutting in the shop shall be used only if automatic or semi-automatic methods are not possible. Cope for pipes and ducts as indicated in the Contract Documents.

.14 Bolting

- .1 Drive bolts accurately into the holes without damaging the threads and heads. Bolts heads and nuts shall rest squarely against metal surfaces.
- .2 Where bolts are to be used on beveled surfaces having slopes greater than 1 in 20 with a plane normal to the bolt axis, provide beveled washers to give full bearing to the thread or nut.
- .3 Bolt threads of unfinished bolts shall be upset to prevent the nuts from backing off.
- .4 Label and ship anchor rods and base plates in sets indicating size and locations of columns and deliver in ample time prior to the start of related concrete Work. Furnish templates together with instructions for setting of

anchor rods. Ascertain that anchor rods and other embedded items are set properly during the progress of the Work. Provide 75 mm x 75 mm x 7 mm plate washers between top of base plate and bottom of anchor rod nuts.

.15 Welding of Structural Steel

.1 Pre-weld Inspection

.1 The surface to be welded and the filler material to be used shall be subject to inspection by quality control personnel before welding is performed.

.2 Method and Type

.1 All welding shall be electric arc welding and shall comply in all respects with the codes and Specifications noted in this Section, incorporating the Specifications for design, fabrication, and inspection of welded structures and the qualifications of welders and supervisors. The heat, input, length of weld, and sequence weld and cooling process shall be controlled to prevent distortions.

.2 For weldments comprised of plates in more than one plane and whose configuration could cause restraint to uniform cooling of the weldment, conform to detailed welding procedures prepared by the Contractor's Engineer.

.3 For weldments comprised of plates thicker than 50 mm or of heavy shapes groups 4 & 5, take adequate precaution to control welding and cooling processes in order to control thermal shrinkage stresses. Use stress relieving techniques where necessary. Each welder shall mark his identification symbol on this Work. Where such plates or shapes are spliced or connected using CJP groove welds, the steel shall be supplied with CVN testing.

3.2 ERECTION

.1 General

.1 Refer to erection procedures and construction sequencing indicated in the Contract Documents.

.2 Bracing members and anchor rods shown in the Contract Documents are for the finished structure and may not be adequate to resist forces present during construction.

.3 Maintain erection bracing until completion of entire structure including floor and roof decks and slabs, masonry walls and/or other elements which are part of the lateral load resisting system.

.4 Carry out erection operations, including installation of any temporary guying and shoring required, ensuring that the existing structure or

- members already erected are not loaded in excess of their safe load carrying capacity.
- .5 Erection bracing must be adequate to restrict lateral drift per storey to an appropriate amount to ensure the steel erection can be completed within the necessary tolerances.
 - .6 During construction, forces or reactions in the steel frame members and their connections might exceed those on which the design is based. Determine the magnitude of such forces and reactions and take such measures as are necessary to ensure that the safety and stability of the structure is maintained until the entire structure, including floor and roof slabs is complete.
 - .7 Nuts on bolts shall be prevented from working loose by use of lock washers, lock nuts, jam nuts, thread burring or other approved methods.
 - .8 Runoff tabs shall be removed where required by the governing technical standard, or where they interfere with clearances required by other disciplines or would be exposed to view in the completed building.
 - .9 Where steel bars or strap anchors are shown connected to structural steel members in the Contract Documents, weld these bars/anchors to the steel members in a manner to fully develop the strength of the bars/anchors.
 - .10 Note that erection of structural steel may be dependent on the Work and progress of related Sections. For example, portions of the roof structure may have to be erected after roof mechanical units are in place. Co-ordinate this Work with the appropriate Sections.
 - .11 Report to the Consultant where members cannot be erected within the specified tolerances without modification or special procedures. Take corrective measures to the Consultant's approval.
 - .12 Leave in place all temporary erection safety cables which have been installed at the bottom chord of the joist members.
- .2 Pre-Steel Erection Conference
- .1 At least 60 days prior to the commencement of steel erection, the Contractor shall hold a pre-erection conference to review the detailed requirements and staging for the steel erection.
 - .2 The Contractor shall require responsible representatives of every party who is concerned with the steel erection to attend the conference, including but not limited to the following:
 - .1 The Contractor
 - .2 Steel Erector
 - .3 Steel Erector's Surveyor
 - .4 Steel Deck Contractor

- .5 All Inspection and Testing Agencies
- .6 Consultant
- .7 Owner's Representative
- .3 Minutes of the meeting shall be recorded and distributed to all parties concerned within 5 days of the meeting.
- .4 The minutes shall include a detailed outline of the steel erection procedure including a schedule of milestone dates for erection staging surveying and sign-offs which will represent the agreements reached by all parties involved.
- .3 Sequence of Construction
 - .1 During winter months the pouring of some slabs on deck may be delayed. The Contractor is to provide any additional guying or bracing to compensate for the temporary loss of diaphragm action and additional dead load, as deemed necessary.
 - .2 Equipment: Operate all machinery, apparatus and staging required for the erection of steelwork in a safe manner. Install, maintain and remove without damage to the other Work, scaffolding, erection bracing and other equipment, etc. as may be necessary or required.
 - .3 Bracing: Securely brace the frame during erection to safely resist all dead loads, lateral loads and other erection stresses. Fully tighten all bolts as soon as possible as the Work progresses. Design erection bracing or guying to limit lateral floor-to-floor displacement to an appropriate amount to ensure steel erection can be completed within necessary tolerances.
 - .4 Errors: Immediately report to the Consultant any errors in shop fabrication or deformations resulting from handling and transportation that prevent the proper assembly and fitting of parts. Make suggestions for corrective Work and obtain approval of the method of correction. Approved corrections shall be made expeditiously at no additional cost to the Owner.
 - .5 Column Base Plates: Column base plates shall be supported and aligned on steel shims or setting bolts. After the supported members have been plumbed and properly positioned, the anchor nuts shall be tightened, in preparation for grouting. Wedges and shims shall be cut off flush with the edges of plates and shall be left in place. All base plates greater than 600 mm (2'0") in any dimension shall be set on steel angle seats or shim packs. Base plates larger than 900 mm (3'0") shall be set on steel angle seats only.
 - .6 Leveling Plates: Leveling plates shall be set to the established lines and elevations. Provide steel shims as required for proper positioning of column/baseplate.
- .4 Bolting and Welding of Structural Steel

- .1 Splices: Fastening of splices of compression members shall be done after the abutting surfaces have been brought completely into contact. Splices will be permitted only where indicated on the Contract Drawings or the reviewed shop drawings.
- .2 Driftpins: These may be used only to bring together the several parts, and shall not be used in such a manner as to distort or damage the steel. Poor matching of holes shall be corrected by drilling to the next larger size and the use of larger size bolts. Plug welding and redrilling will not be permitted, unless a specific instance arises and is approved by the Consultant.
- .3 Hammering: Hammering which may injure or distort the members will not be permitted.
- .4 Additional Material: If the Contractor furnishes additional material for the purpose of erection or if the erection method requires that material be added to certain members, the required modifications and the additional metal parts shall be paid for by the Contractor.
- .5 Bracing
 - .1 Install permanent bracing members by applying a nominal tension such that they will be initially under tension in the completed building.
 - .2 When the structural steel is plumb and level, erect the frame bracing so that, at the time of installation, bracing members are under a stress of 35 MPa plus or minus 6 MPa. Tensioning by drifting will not be permitted.
- .6 Bearing on Concrete or Masonry
 - .1 Set steel baseplates and bearing assemblies true and level at the proper elevation so that upon grouting, they will have full bearing. Unless noted otherwise by the grout supplier, do not vibrate the formwork or baseplate during grout placement. Grout shall be placed on one side only and pushed back under the baseplate with strapping.
 - .2 When directed by the Consultant, lift at least 10 percent grouted bases so that the adequacy of grouting can be examined. If defects are found, more bases will have to be raised.
- .7 Joists
- .8 Anchor joists in accordance with CSA S16 and to safely resist net uplift forces.
- .9 Supply special shoes or steel shims as required to bring joists to required bearing level.
- .10 Provide suitable temporary anchorage until such time as the permanent anchorage system can maintain the joists in their correct position.
- .11 Where joists are exposed or where the ceiling is attached directly to the bottom chord, keep under surface of joists to a true level plane by careful attention to the manufacture, packing under joist bearing and other means necessary.

- .12 Where the Contract Documents call for electrical and mechanical services recessed between joists, space and arrange joists and bridging to permit installation of services.
- .13 Provide ceiling extensions for joist bottom chords as required.
- .14 Lintels
 - .1 Unless a reinforced block or concrete lintel is noted, provide loose steel lintels, to the details shown in the Contract Documents, over openings and recesses including those for mechanical or electrical services in masonry walls or partitions.
- .15 New Steel Work to the Existing Building
 - .1 Prior to proceeding with any Work at the existing building, verify that existing members being connected are of the size and section indicated on the Drawings. If they are not inform the Consultant immediately. Do not proceed until the Consultant has given instructions.
 - .2 Make Site measurements as required to verify dimensions of existing Work before proceeding with the Work. The Contractor shall be responsible for costs incurred due to proceeding without verifying Site dimensions.
 - .3 Adequately shore existing structure to ensure that no movements or damage occurs until the permanent structure shown in the Contract Documents is installed.
- .16 Erection of Large Steel Building Frames Having No Expansion Joints
 - .1 Erect structural steelwork to conform with CSA S16 and any additional requirements as specified in the Contract Documents.
 - .2 Erect the structural steelwork so that the framing is plumb when the mean temperature of the steel frame is at 20°C. Since the building is large and has no expansion joint, some members may be required to be erected out of plumb if the erection is carried out at temperature greatly differing from that noted above.
 - .3 Provide the Consultant with the procedures proposed to achieve this requirement.
 - .4 Make adequate provisions for erection stresses and for sufficient erection bracing to keep the structural steel in true alignment in its designated position, until completion of the entire structure, including floor and roof decks and/or other elements which are part of the wind resisting system. Any bracing members shown in the Contract Documents are those required for the finished structure and may not be sufficient for erection purposes. Design erection bracing so that it will not restrict any anticipated movements of the frame.
 - .5 Do not install the connections of the permanent braced frames until the adjacent columns are plumb.

3.3 PROTECTION

.1 Cleaning Steel

- .1 Clean structural steel and joists in accordance with table below:
- .2 Clean surfaces within 50 mm (2") of any field weld location of materials that would prevent proper welding or produce objectionable fumes while welding Work is being performed.

.2 Painting

- .1 Except where steel is to be galvanized, shop paint structural steel and joists in accordance with the table below:

Environment	Preparation	Primer/Paint	Remarks
Inside Vapour Barrier	SSPC-SP3 Power Tool Cleaning	CISC/CPMA 1-73a	
Inside Vapour Barrier (joists not exposed to view)	SSPC-SP2 Hand Tool Cleaning	CISC/CPMA 1-73a or SSPC Paint 15	
Inside Vapour Barrier (steel exposed to view)	SSPC-SP6 Commercial Blast Cleaning	CISC/CPMA 2-75	
Inside Vapour Barrier (joists exposed to view)	SSPC-SP7 Brush-Off Blast Cleaning	CISC/CPMA 2-75	
High Humidity	SSPC-SP6 Commercial Blast Cleaning	Zinc-rich primer	.
Outside Vapour Barrier (steel)	SSPC-SP6 Commercial Blast Cleaning	Zinc-rich primer	
Outside Vapour Barrier (joists)	SSPC-SP7 Brush-Off Blast Cleaning	[Zinc-rich Touch-Up Paint]	
Outside Vapour Barrier – All remaining steel		Galvanize	Note additional requirements for galvanizing elsewhere in the Specification.

Environment	Preparation	Primer/Paint	Remarks
Outside Vapour Barrier – Steel exposed to salt water	SSPC-SP10 Near White Blast Cleaning	Zinc-rich primer and epoxy paint	
Chemical Exposures	SSPC-SP10 Near White Blast Cleaning	Zinc-rich primer and epoxy paint	

- .2 Do not paint steel items inside the vapour barrier that are to be encased in concrete and surfaces that are to have concrete placed against them or that are to be covered in cementitious fireproofing.
- .3 Where shear connectors are to be field welded through the low flute of the steel deck, the top surface of the top flange, which is to receive the shear studs, is to be unpainted and free of heavy rust, mill scale, sand, or other foreign materials which will interfere with the stud welding operation.
- .4 Joists shall have one coat of protective paint of a type standard with the manufacturer.
- .5 Except where steel is to be galvanized, immediately after cleaning, apply a shop coat paint or primer to steelwork, to dry surfaces by spray, to a minimum dry film thickness of 2 mils (50 μm). Allow to dry in dust free areas.
- .6 Upon completion of erection, clean with mechanical brush and apply primer to welds, bolts and at locations where original primer is damaged.
- .3 Galvanizing
 - .1 In accordance with ASTM A123/A123M, fully galvanize structural steel, structural steel lintels, masonry shelf angles, exterior stairs and other steel materials exposed to weather including connection material and inserts. In addition, all exposed structural steel and connections throughout the Wash Bay are to be galvanized.
 - .2 Where the galvanizing process may distort the members, submit procedures for review by the Consultant and make good to tolerances noted in the Contract Documents.
 - .3 Galvanize members after shop welding has been completed.
 - .4 Do not weld to galvanized steel members. Where welding is necessary, remove galvanizing by grinding.
 - .5 Identify at time of tender any splices that are required due to the size, length or weight constraints imposed by the galvanizing process.

- .6 High strength bolts grade A490M shall not be galvanized.
- .4 Cold Weather Protection
 - .1 During cold weather, protect members from damage due to water freezing in confined areas.
- .5 Corrosion
 - .1 Protect milled surfaces to prevent corrosion prior to erection.

3.4 QUALITY CONTROL

- .1 Visual Inspection
 - .1 As a minimum, carry out visual inspection of all shop and field welds in accordance with CSA W59.
- .2 Non-Destructive Testing (NDT)
 - .1 Non-destructive testing shall be carried out by radiography, magnetic particle or ultra sonic methods, whichever is more appropriate.
 - .2 In addition to visual inspection, the Contractor is to include the following requirements for non-destructive testing:
 - .3 Any deficient welds identified by means of NDT, shall be repaired at the Contractor's expense.
 - .4 Welds found deficient in dimensions, but not in quality may be enlarged by additional welding. Any weld found deficient in quality shall be removed by chipping or gouging and the weld shall be remade.
 - .5 Include for full NDT of all shop welded connections in the first two joists fabricated.
 - .6 Include for full NDT of all shop welded splices.
 - .7 Include for an additional 20% random NDT of remaining shop welded connections.
- .3 Additional Testing for Steel Produced by "Other Mills".
 - .1 Physical samples of the finished structural steel material shall be taken at the Consultant's discretion for verification or determination of either the mechanical properties and or the chemical composition. All physical samples tested shall meet the requirements set out in CAN/CSA G40.20 and G40.21.
- .4 General
 - .1 Bring to the attention of the Consultant any defects in the Work or departures from the Contract Documents which may occur during construction. The Consultant will decide upon corrective action and give recommendations in writing.

- .2 The Consultant's general review during construction and inspection and testing by Independent Inspection and Testing Companies reporting to the Consultant are both undertaken to inform the Owner of the Contractor's performance and shall in no way augment the Contractor's quality control or relieve the Contractor of contractual responsibility.

3.5 NOTIFICATION

- .1 Prior to commencing significant segments of the Work, give the Consultant and Independent Inspection and Testing Companies appropriate notification so as to afford them reasonable opportunity to review Work previously completed. Failure to meet this requirement may be cause for the Consultant to classify the Work as defective.

3.6 INSPECTION AND TESTING

- .1 The Owner will appoint the Independent Inspection and Testing Companies to make inspections or perform tests as the Consultant directs. The Independent Inspection and Testing Company shall be responsible only to the Consultant, and shall make only such inspections or tests as the Consultant may direct.
- .2 When defects are revealed, the Consultant may request, at the Contractor's expense, additional inspection or testing to ascertain the full extent of the defect.
- .3 Inspection and testing may also include the non-destructive testing of the full butt welds, testing of headed studs on beams and on connections to be cast into concrete.

3.7 DEFECTIVE MATERIALS AND WORK

- .1 Where evidence exists that defective Work has occurred or that Work has been carried out incorporating defective materials, the Consultant may have tests, inspections or surveys performed, analytical calculations of structural strength made and the like in order to help determine whether the Work must be replaced. Tests, inspections or surveys or calculations carried out under these circumstances will be made at the Contractor's expense, regardless of their results, which may be such that, in the Consultant's opinion, the Work may be acceptable.
- .2 All testing shall be conducted in accordance with the requirements of the Building Code, except where this would, in the Consultant's opinion, cause undue delay or give results not representative of the rejected material in place. In this case, the tests shall be conducted in accordance with the standards given by the Consultant.
- .3 Materials or Work which fail to meet specified requirements may be rejected by the Consultant whenever found at any time prior to the Total Performance of the Work regardless of previous inspection. If rejected, defective materials or Work shall be promptly removed and replaced or repaired to the satisfaction of the Consultant, at no expense to the Owner.

END OF SECTION 05 12 00

Part 1 General

1.1 SUMMARY

- .1 This Section Includes:
 - .1 Requirements regarding the appearance and surface preparation of Architecturally-Exposed Structural Steel (AESS). Refer to Division 5, Structural Steel Sections for all other requirements regarding steel work not included in this section. This section applies to any members noted on Architectural and Structural drawings as AESS.
- .2 Related Requirements:
 - .1 Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to the Section.
 - .2 05 31 00 - Steel Deck
 - .3 Section 05 50 00 - Metal Fabrications
 - .4 Section 09 91 00 - Painting

- .2 Definitions of Categories: In accordance with CISC Code of Standard Practice for Structural Steel, the following Categories shall be used when referring to AESS:
 - AESS 1: Basic Elements
Suitable for "basic" elements which require enhanced workmanship.
 - AESS 2: Feature Elements View at a Distance > 6 m
Suitable for "feature" elements viewed at a distance greater than six metres. The process involves basically good fabrication practices with enhanced treatment of weld, connection and fabrication detail, tolerance for gaps, and copes.
 - AESS 3 Feature Elements View at a Distance ≤ 6 m
Suitable for "feature" elements where the designer is comfortable allowing the viewer to see the art of metalworking. Welds are generally smooth but visible; some grind marks are acceptable. Tolerances are tighter than normal standards. The structure is normally viewed closer than six metres and is frequently subject to touching by the public.
 - AESS 4 Showcase Elements
Suitable for "showcase or dominant" elements where the designer intends the form to be the only feature showing in an element. All welds are ground and filled edges are ground square

and true. All surfaces are sanded/filled. Tolerances of fabricated forms are more stringent – generally one-half of the standard tolerance. All surfaces are to be “glove” smooth.

AESS C: Custom Elements

Suitable for elements which require a different set of Characteristics than specified in Categories 1, 2, 3, or 4.

1.3 ADMINISTRATIVE REQUIREMENTS

- .1 Pre-installation Conference: The General Contractor shall schedule and conduct conference at the project site to comply with requirements of Division 1 - Project Meetings. As a minimum, the meeting shall include the General Contractor, Fabricator, Erector, the finish-painting subcontractor, and the Consultant. Coordinate requirements for shipping, special handling, attachment of safety cables and temporary erection bracing, touch up painting and other requirements for AESS.
- .2 Coordinate installation of anchors for AESS members that connect to the work of other trades. Furnish setting drawings, templates, and directions for installing anchors, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver such items to the project site in time for installation. Anchorage concepts shall be as indicated on drawings and approved on final shop drawings.

1.4 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 General: Submit each item below according to the Conditions of the Contract and Division 1 Specification Sections.
- .2 Product Data for each type of product specified.
- .3 Shop Drawings detailing fabrication of AESS components.
 - .1 Provide erection drawings clearly indicating which members are considered as AESS members.
 - .2 Include details that clearly identify all of the requirements listed in the Fabrication Article and the Erection Article of this specification. Provide connections for exposed AESS consistent with concepts shown on the architectural or structural drawings.
 - .3 Indicate welds by standard AWS symbols, distinguishing between shop and field welds, and show size, length and type of each weld. Identify grinding, finish and profile of welds as defined herein.
 - .4 Indicate type, size, finish and length of bolts, distinguishing between shop and field bolts. Identify high-strength bolted slip-critical, direct-tensioned shear/bearing connections. Indicate to which direction bolt heads should be oriented.
 - .5 Clearly indicate which surfaces or edges are exposed and what class of surface preparation is being used.
 - .6 Indicate special tolerances and erection requirements as noted on the drawings or defined herein.

- .4 Qualification data for firms and persons specified in the 'Quality Assurance' Article to demonstrate their capabilities and experience. Include lists of completed projects names and address, names and addresses of Consultants and owners, and other information specified. For each project, submit photographs showing detail of installed AESS.

1.5 QUALITY ASSURANCE

- .1 Fabricator Qualifications: In addition to those qualifications listed in Division 5 Section 'Structural Steel,' engage a firm experienced in fabricating AESS similar to that indicated for this Project with a record of successful in-service performance, as well as sufficient production capacity to fabricate AESS without delaying the Work.
- .2 Erector Qualifications: In addition to those qualifications listed in Division 5 Structural Steel Sections, engage an experienced Erector who has completed AESS work similar in material, design, and extent to that indicated for this Project and with a record of successful in-service performance.
- .3 Comply with applicable provisions of the following specifications and documents:
 - .1 AISC 303 Code of Standard Practice for Steel Buildings and Bridges, latest edition,
 - .2 Section 10 as amended herein.
- .4 Mock-ups: At least four weeks prior to fabricating AESS, the contractor shall construct mock-ups to demonstrate aesthetic effects as well as qualities of materials and execution. Mock-ups shall be built by the Contractor or Subcontractor responsible for the Project Work. Build mock-ups to comply with the following requirements, using all conditions and materials indicated for completed unit of Work.
 - .1 Locate mock-ups on-site or in the fabricator's shop as directed by Consultant. Mock-ups shall be full-size pieces unless the Consultant approves smaller models.
 - .2 Notify the Consultant 7 days in advance of the dates and times when mockups will be available for review.
 - .3 Demonstrate the proposed range of aesthetic effects regarding each element listed under the fabrication heading below.
 - .4 Mockup will have finished surface (including surface preparation and paint system).
 - .5 Obtain Consultant's approval of mockups before start of fabrication of final units.
 - .6 Retain and maintain mockups during construction in an undisturbed condition as a standard for judging the completed work.
 - .7 Approved mockups in an undisturbed condition at the time of Substantial Performance may become part of the completed Work.

1.6 DELIVERY, STORAGE, AND HANDLING

- .1 Deliver AESS to Project site in such quantities and at such times to ensure continuity of installation.

- .2 Store materials to permit easy access for inspection and identification. Keep steel members off ground by using pallets, platforms, or other supports. Protect steel members and packaged materials from erosion and deterioration. Use special care in handling to prevent twisting or warping of AESS members.
- .3 Erect pre-painted finish pieces using padded slings or other methods such that they are not damaged. Provide padding as required to protect while rigging and aligning member's frames. Weld tabs for temporary bracing and safety cabling only at points concealed from view in the completed structure or where approved by the Consultant during the pre-installation meeting. Methods of removing temporary erection devices and finishing the AESS members shall be approved by the Consultant prior to erection.

1.7 SITE CONDITIONS

- .1 Existing Conditions:
 - .1 Field Measurements: Where AESS is indicated to fit against walls and other construction, verify dimensions by field measurements before fabrication and indicate measurements on shop drawings. Coordinate fabrication schedule with construction progress to avoid delaying the work.

Part 2 Products

2.1 MATERIALS

- .1 General: Meet requirements Division 5 Structural Steel Sections as amended below.
- .2 High-Strength Bolts, Nuts, and Washers: Per Division 5 Structural Steel Sections heavy hex heads and nuts provide rounded bolt heads with twist-off bolts. Provide standard carbon steel mechanically galvanized finish.

2.2 PRIMERS

- .1 Compatibility: The General Contractor shall submit all components/procedures of the paint system for AESS as a single coordinated submittal. As a minimum, identify required surface preparation, primer, intermediate coat (if applicable) and finish coat. All of the items shall be coordinated with the finish coat specified in Division 9.
- .2 Primer: Fabricator's standard alkyd red oxide, rust inhibiting primer.
- .3 Primer: Fast curing, universal modified alkyd, rust inhibiting shop coat with good resistance to normal atmospheric corrosion. Primer shall comply with all federal standards for VOC, lead and chromate levels.
- .4 Primer: Acrylic water-soluble shop coat with good resistance to normal atmospheric corrosion. Primer shall comply with all federal standards for VOC, lead and chromate levels.
- .5 Primer: Fast-curing two-part epoxy. Primer shall comply with all federal standards for VOC, lead and chromate levels.

- .6 Primer: Organic, epoxy/zinc-rich, meeting class B surface requirements for slip-critical connections. Primer shall comply with all federal standards for VOC, lead and chromate levels.
- .7 Primer: Inorganic zinc-rich meeting class B surface requirements for slip-critical connections. Primer shall comply with all federal standards for VOC, lead and chromate levels.
- .8 Galvanizing Repair Paint: High-zinc-dust-content paint for galvanizing welds and repair-painting galvanized steel, with dry-film coating not less than 90-percent zinc dust by weight.

2.3 FABRICATION

- .1 Fabricate and assemble AESS in accordance with AESS Category 3 - Feature Elements View at a Distance ≤ 6 m.
- .2 Fabricate and assemble AESS in the shop to the greatest extent possible. Locate field joints in AESS assemblies at concealed locations or as approved by the Consultant. Detail AESS assemblies to minimize field handling and expedite erection.
- .3 Fabricate AESS with exposed surfaces smooth, square and of surface quality consistent with the approved mock up. Use special care in handling and shipping of AESS both before and after shop painting.
- .4 In addition to special care used to handle and fabricate AESS, employ the following fabrication techniques.
 - .1 Fabrication Tolerance: Fabricate steel to one half the normal tolerance as specified in the Code of Standard Practice, Section 10.
 - .2 Welds ground smooth: Fabricator shall grind welds of AESS smooth. For groove welds, the weld shall be made flush to the surfaces each side and be within $+1.6$ mm, of plate thickness.
 - .3 Contouring and blending of welds: Where fillet welds are indicated to be ground-contoured, or blended, oversize welds as required and grind to provide a smooth transition and to match profile on approved mock-up.
 - .4 Continuous Welds: Where welding is noted on the drawings, provide continuous welds of a uniform size and profile.
 - .5 Minimize Weld Show Through: At locations where welding on the far side of an exposed connection occurs, grind distortion and marking of the steel to a smooth profile with adjacent material.
 - .6 Coping and Blocking Tolerance: Maintain a uniform gap of $3.1 \text{ mm} \pm 0.8 \text{ mm}$ at all copes and blocks.
 - .7 Joint Gap Tolerance: Maintain a uniform gap of $3.1 \text{ mm} \pm 0.8 \text{ mm}$.
 - .8 Piece Marks Hidden: Fabricate such that piece marks are fully hidden in the final structure or made with such media to permit full removal after erection.
 - .9 Mill Mark Removal: Fabricator shall deliver steel with no mill marks (stenciled, stamped, raised etc) in exposed locations. Mill marks shall be omitted by cutting of mill material to appropriate lengths where possible.

Where not possible, the fabricator can fill and/or grind to a surface finish consistent with the approved mock up.

- .10 Grinding of sheared edges: Fabricator shall grind all edges of sheared, punched or flamecut steel to match approved mockup.
- .11 Rolled Members: Member specified to be rolled to a final curved shape shall be fully shaped in the shop and tied during shipping to prevent stress relieving. Distortion of the web or stem, and of outstanding flanges or legs of angles shall be visibly acceptable to the Consultant from a distance of 6096 mm under any lighting condition determined by the Consultant. Tolerances for the vertical and horizontal walls of rectangular HSS members after rolling shall be the specified dimension +/- 13 mm.
- .12 Seal weld open ends of round and rectangular hollow structural section with 9.5 mm closure plates. Provide continuous, sealed welds at angle to gusset-plate connections and similar locations where AECS is exposed to weather.

2.4 SHOP CONNECTIONS

- .1 Bolted Connections: Make in accordance with Division 5 Structural Steel Sections. Provide bolt type and finish as noted herein and align bolt heads as indicated on the approved shop erection drawings.
- .2 Weld Connections: Comply with AWS D1.1 and Division 5 Structural Steel Sections. Appearance and quality of welds shall be consistent with the mock up. Assemble and weld built-up sections by methods that will maintain alignment of members without warp exceeding the tolerance of this section.

2.5 SHOP PRIMING

- .1 Shop-prime steel surfaces, except the following:
 - .1 Surfaces embedded in concrete or mortar. Extend priming of partially embedded members to a depth of 51 mm.
 - .2 Surfaces to be field welded.
 - .3 Surfaces to be high-strength bolted with slip critical connections, if primer does not meet the specified AISC slip coefficient.
- .2 Surface Preparation: Clean surfaces to be painted. Remove loose rust, loose mill scale, and spatter, slag, or flux deposits. Prepare surfaces according to SSPC Specifications as follows:
 - .1 SSPC-SP 1 "Solvent Cleaning"
 - .2 SSPC-SP 2 "Hand Tool Cleaning." (This level of surface preparation will not be adequate for most paint systems for AECS construction.)
 - .3 SSPC-SP 3 "Power Tool Cleaning." (This level of surface prep is the minimum for most AECS projects. It may be acceptable for alkyd primers and acrylic or alkyd finish coats, particularly in interior applications.)
 - .4 SSPC-SP 6 "Commercial Blast Cleaning." (This level of surface prep adds significantly to the total cost of the steel. It is required for epoxy primers to allow adequate bonding to the steel. Recommended for locations where a rust inhibitive primer will be used in an exterior

application. It is also required where polyurethane finish coats will be used over the primer.)

- .5 Coordinate the required blast profile with the approved paint submittal prior to beginning surface preparation.
- .3 Priming: Immediately after surface preparation, apply primer according to manufacturer's instructions to provide a dry film thickness of not less than 1.5 mils (0.038 mm). Use priming methods that result in full coverage of joints, corners, edges, and exposed surfaces.
 - .1 Stripe paint corners, crevices, bolts, welds, and sharp edges.
 - .2 Apply two coats of shop primer to surfaces that are inaccessible after assembly or erection.

2.6 GALVANIZING

- .1 Hot-Dip Galvanized Finish: Apply zinc coating by the hot-dip process to AESS indicated for galvanizing according to ASTM A123/A123M. Fabricate such that all connections of assemblies are made in the field with bolted connections. Provide galvanized finish on members and assemblies within the range of color and surface textures presented in the mock ups.

2.7 FINISHES

- .1 Provide LEED compliant coatings for VOC ratings.
- .2 Galvanizing: hot dipped galvanizing with zinc coating 600 g/m² to CSA-G164.
- .3 Shop Primers: Provide primers that are compatible with paint systems specified.
- .4 Touch-up galvanized surfaces with zinc rich coating, to ASTM A780/A780M: NPFC-MIL-P-21035 zinc rich paint, minimum DFT 8 mils.
- .5 Painting: in accordance with Section 09 91 00 – Painting. Colour as indicated on Drawings.

Part 3 Execution

3.1 EXAMINATION

- .1 The erector shall check all AESS members upon delivery for twist, kinks, gouges or other imperfections which might result in rejection of the appearance of the member. Coordinate remedial action with fabricator prior to erecting steel.

3.2 PREPARATION

- .1 Provide connections for temporary shoring, bracing and supports only where noted on the approved shop drawings. Temporary connections not shown shall be made at locations not exposed to view in the final structure or as approved by the Consultant. Handle, lift and align pieces using padded slings and/or other protection required to maintain the appearance of the AESS through the process of erection.
- .2 Coordinate installation of anchors for AESS members that connect to the work of other trades. Furnish setting drawings, templates, and directions for installing

anchors, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver such items to the project site in time for installation. Anchorage concepts shall be as indicated on drawings and approved on final shop drawings.

3.3 ERECTION

- .1 Set AESS accurately in locations and to elevations indicated, and according to AISC specifications referenced in this Section.
- .2 In addition to the special care used to handle and erect AESS, employ the following erection techniques:
 - .1 AESS Erection tolerances: Erection tolerances shall meet the requirements of standard frame tolerances for structural steel per Chapter 7 of the AISC Code of Standard Practice.
 - .2 AESS Erection Tolerances: Erection Tolerances shall meet the requirements of Chapter 10 of the AISC Code of Standard Practice.
 - .3 Welds ground smooth: Erector shall grind welds smooth in the connections of AESS members. For groove welds, the weld shall be made flush to the surfaces of each side and be within + 1.6 mm of plate thickness.
 - .4 Contouring and blending of welds: Where fillet welds are indicated to be ground contoured, or blended, oversize welds as required; grind to provide a smooth transition and to match profile on approved mock-up.
 - .5 Continuous Welds: Where noted on the drawings, provide continuous welds of a uniform size and profile.
 - .6 Minimize Weld Show Through: At locations where welding on the far side of an exposed connection occurs, grind distortion and marking of the steel to a smooth profile with adjacent material.
 - .7 Bolt Head Orientation: All bolt heads shall be oriented as indicated on the contract documents. Where bolt-head alignment is specified, the orientation shall be noted for each connection on the erection drawings. Where not noted, the bolt heads in a given connection shall be oriented to one side.
 - .8 Removal of field connection aids: Run-out tabs, erection bolts and other steel members added to connections to allow for alignment, fit-up, and welding in the field shall be removed from the structure. Field groove welds shall be selected to eliminate the need for backing bars or to permit their removal after welding.
 - .9 Welds at run-out tabs shall be removed to match adjacent surfaces and ground smooth. Holes for erection bolts shall be plug welded and ground smooth.
 - .10 Filling of weld access holes: Where holes must be cut in the web at the intersection with flanges on W shapes and structural tees to permit field welding of the flanges, they shall be filled. Filling shall be executed with proper procedures to minimize restraint and address thermal stresses in group 4 and 5 shapes.
- .3 Field Welding: Weld profile, quality, and finish shall be consistent with mock-ups approved prior to fabrication.

- .4 Splice members only where indicated.
- .5 Obtain permission for any torch cutting or field fabrication from the Consultant. Finish sections thermally cut during erection to a surface appearance consistent with the mock up.
- .6 Do not enlarge unfair holes in members by burning or by using drift pins. Ream holes that must be enlarged to admit bolts. Replace connection plates that are misaligned where holes cannot be aligned with acceptable final appearance.

3.4 FIELD CONNECTIONS

- .1 Bolted Connections: Install bolts of the specified type and finish in accordance with Division 5 section "Structural Steel."
- .2 Welded Connections: Comply with AWS D1.1 for procedures, and appearance. Refer to Division 5 Structural Steel Sections for other requirements.
 - .1 Assemble and weld built-up sections by methods that will maintain true alignment of axes without warp. Verify that weld sizes, fabrication sequence, and equipment used for AESS will limit distortions to allowable tolerances.
 - .2 Obtain Consultants approval for appearance of welds in repaired or field modified work.

3.5 FIELD QUALITY CONTROL

- .1 Structural requirements: The Owner will engage an independent testing and inspecting agency to perform field inspections and tests and to prepare test reports. Refer to Division 5 Structural Steel Sections for detailed bolt and weld testing requirements.
- .2 AESS acceptance: The Consultant shall observe the AESS steel in place and determine acceptability based on the mockup. The Testing Agency shall have no responsibility for enforcing the requirements of this section.

3.6 ADJUSTING AND CLEANING

- .1 Touchup Painting: Cleaning and touchup painting of field welds, bolted connections, and abraded areas of shop paint shall be completed to blend with the adjacent surfaces of AESS. Such touch up work shall be done in accordance with manufacturer's instructions as specified in Section 09 91 00 - Painting.
- .2 Galvanized Surfaces: Clean field welds, bolted connections, and abraded areas and repair galvanizing to comply with ASTM A780/A780M.

END OF SECTION

Part 1 General

1.1 Definitions

- .1 The following Definitions shall apply in this Specification:
- .2 Contract Documents
 - .1 The Contract Documents consist of the Drawings, Specifications and Reports which form part of the agreed Contract.
- .3 Consultant
 - .1 The Consultant is the Architect, SEOR, persons or entities engaged by the Owner. The term Consultant means the Consultant or the Consultant's authorized representative.
- .4 Contractor
 - .1 The term Contractor is defined to include any of the following: Construction Manager, General Contractor, Structural Steel Erector, Structural Steel Fabricator, Subcontractor or Supplier.
- .5 Owner
 - .1 The Owner is the person or entity identified as such in the Contract. The term Owner means the Owner or the Owner's authorized agent or representative but does not include the Consultant.
- .6 SEOR
 - .1 The SEOR is defined as the Structural Engineer of Record for the Contract.

1.2 WORK INCLUDED

- .1 Comply with Division 1, General Requirements and all documents referenced therein.
- .2 Provide all labour, materials, plant and equipment to complete the steel deck work including, but not limited to, the following:
 - .1 Steel deck and accessories, including all gauge metal closures;
 - .2 Framing for openings up to and including 450 mm in roof deck and 300mm in floor deck; and
 - .3 Shear stud connectors.

1.3 RELATED WORK SPECIFIED ELSEWHERE

- .1 Concrete Reinforcement, Section 03 20 00
- .2 Cast-in-Place Concrete, Section 03 30 00
- .3 Structural Steel, Section 05 12 00 Support framing for openings larger than 450 mm in roof deck, 300 mm in floor deck and deck edge supports where loss of bearing for the steel deck occurs.

1.4 REFERENCE STANDARDS, CODES, AND ACTS

- .1 Conform to the requirements of the local building code identified on the Structural General Notes as amended by all subsequent Regulations issued to the date of this Specification and applicable acts of authorities having jurisdiction.
- .2 All references to the Standards and publications noted below shall be to the edition referenced in the local building code identified on the Structural General Notes, or to the edition referenced in the latest published editions or revisions of all Standards published by the Canadian Standards Association issued to the date of this Specification, whichever is the later edition or revision.
- .3 All references noted below, which are not referenced by the local building code or the Standards published by the Canadian Standards Association, shall be to the latest edition and revision published to the date of this Specification.
- .4 Standards and publications referenced by the Standards noted below are to apply even if they are not included in the list. Where such reference is made, it shall be to that latest edition and revision published to the date of this Specification.
 - .1 ASTM A36/A36M - Carbon Structural Steel.
 - .2 ASTM A108 - Steel Bar, Carbon and Alloy, Cold-Finished.
 - .3 ASTM A653/A653M - Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.
 - .4 CSA-S136 - Design of Cold-Formed Steel Structural Members.
 - .5 CSA-W47.1 - Certification of Companies for Fusion Welding of Steel Structures.
 - .6 CSA-W48 - Filler Metals and Allied Materials for Metal Arc Welding.
 - .7 CSA-W55.3 - Certification of Companies for Resistance Welding of Steel and Aluminum.
 - .8 CSA-W59 - Welded Steel Construction (Metal Arc Welding).
 - .9 CSSBI 10M - Standard for Steel Roof Deck.
 - .10 CSSBI 12M - Standard for Composite Steel Deck.
 - .11 CSSBI B13 - Design of Steel Deck Diaphragms
 - .12 FM (Factory Mutual) - Roof Assembly Classifications.
 - .13 SDI (Steel Deck Institute) - Design Manual for Composite Decks, Form Decks, Roof Decks, Cellular Metal Floor Deck with Electrical Distribution.
 - .14 SSPC (The Society for - Steel Structures Painting Manual. Protective Coatings)
 - .15 ULC (Underwriters Laboratories of Canada) – List of Equipment and Materials for:
 - .1 ITS - Intertek Testing Services - Certification Listings.

- .16 Where there are differences between the Specifications and Drawings and the codes, standards, or acts, the most stringent shall govern.
- .5 Standards referenced by the standards noted above shall apply even if they are not included in the list. Where such references are made, they shall be to the latest edition and revision published.

1.5 QUALIFICATIONS

- .1 Organizations and welders undertaking to weld under this Contract shall be certified by the Canadian Welding Bureau under the requirements of W47.1 as applicable.
- .2 The Contractor shall ensure that the manufacturer and the steel deck erector shall each demonstrate a minimum of 10 years of relevant experience with the steel deck systems specified in the Contract Documents.
- .3 Design calculations shall be carried out by or under the direct supervision of a qualified Professional Engineer licensed in the Province having jurisdiction, with a minimum of 5 years Canadian experience in the design of steel deck.

1.6 DESIGN

- .1 Design steel deck in accordance with the requirements of the Building Code.
- .2 The minimum steel core thickness shall be 0.76 mm except that for steel deck which is considered architecturally exposed to view the minimum steel core thickness shall be 0.91 mm.
- .3 Design floor deck such that the live load deflection of deck shall not exceed $l/360$ of the span.
- .4 Design roof deck such that the live load deflection of deck shall not exceed $l/300$ except when deck supports non-structural services or finishes that are identified as being susceptible to damage. In this case, design roof deck such that deflection of deck shall not exceed $l/360$ of the span.
- .5 Design roof deck such that deflection does not exceed $l/300$ of the span when supporting a 1.3 kN point load acting over a 300 mm strip of deck.
- .6 Design deck anchorage to the supporting structure to safely resist the net uplift forces indicated in the Contract Documents. Design anchorages for deck supporting concrete slabs for net uplift during construction.
- .7 Wherever structural framing permits, steel deck shall be designed and fabricated to span continuously over at least four supports (three spans).
- .8 Determine structural properties of the concrete slab and composite construction in accordance with requirements of The Building Code.
- .9 Design and install composite deck and metal edge and closure strips to safely support construction and other loads before the composite action of the deck system takes place, without excessive deflection. Design and detail temporary intermediate supports for the composite deck where required. Identify areas

where this is required and submit shop drawings showing the proposed temporary support detail.

- .10 Design framing for openings through the deck up to a maximum width of 300 mm in floor deck and 450 mm in roof deck measured perpendicular to the span of the deck.
- .11 Detail metal edge and closure strips to prevent the loss of grout when the deck is concreted.
- .12 Headed studs have been designed to ensure composite action between the steel framing members and the slab on deck floor system. The design of these studs has been based on an assumed steel deck profile where the average flute width is at least twice the height of the deck.

1.7 Submittals

- .1 Shop Drawings
 - .1 Submit shop and erection drawings and load tables for review by the Consultant.
 - .2 Unless noted otherwise in the Contract Documents on all shop drawings provide adequate space immediately above the drawing's title block for a Consultant's Shop Drawing review stamp. Where requested by the Consultant, the stamp is to be inserted by this section directly into the shop drawing prior to submission. The stamp shall be positioned in the same location on each shop drawing, and in no case shall the allocated space be less than 63mm x 75 mm. Request the details of these requirements from the Consultant no less than 2 weeks before the commencement of shop drawings.
 - .3 Each drawing submitted shall bear the signature and stamp of a qualified Professional Engineer licensed in the Province having jurisdiction.
 - .4 The structural Drawings shall not be reproduced, in whole or in part, for use as shop drawings.
 - .5 As a minimum, the shop drawings shall show the following:
 - .1 Types of deck and their locations, including the setting out points for the deck;
 - .2 Sufficient detail sections showing the deck's orientation to support members to facilitate erection of deck;
 - .3 Design loads, including diaphragm forces;
 - .4 Connections to supports including welding details and details for pins and screws if appropriate;
 - .5 Net uplift pressures, including pressures during construction;
 - .6 Openings and their reinforcement, coordinated with the mechanical and electrical contractor's sleeving drawings;

- .7 Base steel thickness;
 - .8 Surface protective coating;
 - .9 Metal edge and closure strips;
 - .10 Acoustic details, if applicable;
 - .11 Locations of shoring (if required) and the shoring loads imposed on the structures below;
 - .12 Locations, size, type, and welding requirements of welded stud shear connectors;
 - .13 Diaphragm shear stiffness factor, as required; and
 - .14 Areas where insufficient bearing on supporting steel members will be provided due to steel connections, vertical bracing connections or the like. Coordinate with Section 05 12 00 – Structural Steel for additional bearing details required in these locations.
- .6 Provide the inspection company with a copy of each reviewed drawing bearing the Consultant's shop drawing review stamp.
- .2 Calculations
- .1 Submit calculations bearing the seal and signature of the qualified Professional Engineer licensed in the Province having jurisdiction and such further proof as may be necessary to show that the steel deck and all related accessories conform to the requirements set forth in this Section.
- .3 As-Built Drawings
- .1 Mark on a complete set of final drawings any changes, additions, or deletions that occurred during construction.
 - .2 For all shop drawings marked "Reviewed as Noted" or "Revise and Resubmit", update and submit a record set of these drawings at the completion of the structural Work. Ensure that these drawings reflect the changes and are coordinated with the final drawings noted above.
- .4 Mill Test Reports
- .1 Submit all mill test reports covering chemical and physical properties of materials used in this Work a minimum of 4 weeks prior to commencing fabrication.
- .5 Surveys
- .1 Submit surveys showing position of structural elements in their as-built condition. Coordinate the location of survey points described below with those noted in Section 05 12 00 – Structural Steel.
 - .2 At a minimum, submit the following:

- .1 Elevation of deck at all columns, centre of bays, midway between columns along gridlines and at cantilever ends, on all floors, as follows:
- .2 Location of slab edges at all perimeter columns and midway between columns along the perimeter; and
- .3 Dates of all surveys

Part 2 Materials

2.1 STEEL DECK

- .1 Sheet Steel: ASTM A653/A653M, Structural Quality; with Z180 (G60) or ZF75(A25) minimum coating for steel deck not considered architecturally exposed to view or weather. Deck which is considered architecturally exposed to view or weather or deck in high humidity areas shall have Z275 (G90) minimum coating.
- .2 The composite steel deck and concrete slab shall comply with the fire-rating requirements.
- .3 Provide steel deck profile with interlocking side joints.
- .4 Related Deck Accessories: Metal closure strips, wet concrete stops, cover plates, cant strips.
- .5 Stud Shear Connectors: ASTM A108, Grade 1015. Headed studs shall be welded per manufacturer recommendations.
- .6 Mechanical Fasteners: Fasteners shall have knurled shank; minimum 12 mm diameter steel washers; electroplated zinc coating conforming to ASTM B633, Sc. 1, Type III; meeting CSSBI design requirements, such as Hilti X-EDNK22 THQ12, X-EDN19 THQ12, or X-ENP-19 L15 fasteners. For use on open web steel joists with top flange thicknesses between 3 mm to 6 mm, use Hilti X-EDNK22 THQ12 fasteners. For open web steel joists or beams with a top flange thickness of 5 mm to 10 mm use Hilti X-EDN19 THQ12 fasteners. For flanges equal to or greater than 6 mm, use Hilti X-ENP-19 L15 fasteners. Verify performance and applicability of application with the manufacturer by performing test fastenings prior to the installation of the deck.
- .7 Side Lap Connectors: Sidelap connectors to connect steel deck units at overlaps can consist of Hilti SLC 01 for gauges 18 to 26 or the Hilti SLC 02 for gauges 16 to 22.
- .8 Welding Materials: Type required for materials being welded.
- .9 Shop and Touch-Up Primer: SSPC-Paint 15 or the Manufacturer's standard, complying with SSPC-Paint 15.

Part 3 Execution

3.1 INSTALLATION

- .1 General

- .1 Install steel deck to manufacturer's written instructions and to CSSBI requirements.
 - .2 Install steel deck such that it is free of dirt, scale, foreign matter, dents, or deformations. Deck, which is considered architecturally exposed to view, that is dented or deformed is subject to acceptance by the Consultant.
 - .3 Lap ends of deck units not receiving concrete slab a minimum of 50 mm and only over supporting members.
 - .4 Where steel deck spans parallel to beams that are to have studs added to top flange, arrange bottom flutes to be centred over beams. If this is not possible, interrupt decking so that studs can be placed on beams to allow composite action to take place.
 - .5 Bear deck on masonry and concrete support surfaces with 150 mm minimum bearing. Align and level the deck.
 - .6 Bear deck on steel supports with 75 mm minimum bearing. Align and level the deck.
 - .7 Fasten steel deck to supporting members to safely resist the forces indicated in the Contract Documents but with not less than 19 mm (3/4") diameter fusion welds at 300 mm on center at intermediate supports and 19 mm (3/4") diameter fusion welds at 150 mm on center at end supports parallel with the deck flute and at each transverse flute.
 - .8 Weld to CSA-W59
 - .9 Mechanically clinch male/female side laps to resist the forces indicated in the Contract Documents but at not more than 600 mm (24") on center maximum.
 - .10 Make fusion welds of deck to supporting members well within bearing width of supporting members.
 - .11 Provide gauge metal closures along edges of all deck parallel to span where deck is not otherwise continuously supported, at all changes in direction of the span of the deck, at all discontinuities of sloped deck, and at all openings through concrete slabs on steel deck.
 - .12 Level and align cellular deck within [3 mm] horizontally and vertically. Butt ends, allow for maximum 3 mm gap. Install sheet steel covers over gaps wider than 3 mm. Tape and seal joints watertight.
- .2 Openings Through Deck
- .1 Obtain opening and sleeving information from Subcontractors responsible for the related Work of other Sections before proceeding with the work. Coordinate with the Work of other Sections as necessary.
 - .2 Indicate openings and reinforcement for openings on fabrication and erection drawings.

- .3 Cut openings and reinforce edges as required for pipes, ducts, and the like. The maximum size of an unreinforced opening is 150 mm square or in diameter. Reinforce openings having a dimension over 150 mm but not exceeding 300 mm in floor deck or 450 mm in roof deck. The location of holes through decking shall be to the approval of the Consultant.
- .4 Where possible, leave deck intact and use block outs to form concrete edges at openings. Cut deck after concrete has reached a minimum of 70% of its 28 day specified strength.
- .3 Supports from Deck
 - .1 No hangers or brackets supporting mechanical and electrical services, artwork, ceilings, bulkheads, lighting and the like from the roof deck are permitted, unless the deck is designed specifically for the imposed loads.
- .4 Welded Stud Shear Connectors
 - .1 Weld headed studs to the supporting structural steel through the steel deck as per the requirements of CSA Standard W59, except where studs are required to be welded to the steel in the shop.
 - .2 Where stud shear connectors are shop welded to supporting steel members, accurately layout and predrill holes in the deck to facilitate installation of the deck in the field. The use of torch cutting of holes is not permitted.
- .5 Protection
 - .1 Immediately after any deck which does not receive a concrete slab is permanently secured in place, touch up top surface of deck with primer, where the shop applied coating is damaged during installation or by welding of the deck in place.
- .6 Closures
 - .1 Seal off spaces between flutes with closures of neoprene or closed cell expanded p.v.c. at partitions, walls, and other locations indicated in the Contract Documents. At exterior walls, provide insulated closures.
 - .2 Where steel deck rests on exterior masonry walls, fill web spaces with closures as recommended by manufacturer.
 - .3 Where flutes are at right angles to exterior walls, and deck exposed on underside extends beyond these walls, install interior and exterior closures. In addition, provide roofer with sufficient quantity of glass fibre pads to close off topside flutes directly over face of wall or use closures as recommended by manufacturer.
 - .4 Where flutes run at right angles to interior partitions, fill web spaces with double run of steel closures or as recommended by manufacturer.

- .5 Where flutes are parallel to interior partitions, install steel closure flashings to provide neat juncture between two materials or as recommended by manufacturer.
- .6 Closures are not required between interior partitions and underside of deck in areas having suspended ceiling, unless specified by the Consultant.
- .7 Attach metal cell closures at locations required to contain poured concrete.

3.2 QUALITY CONTROL

- .1 Implement a system of quality control to ensure that the minimum standards specified in this Section are attained.
- .2 Bring to the attention of the Consultant any defects in the Work or departures from the Contract Documents which may occur during construction. The Consultant will decide upon corrective action and give recommendations in writing.
- .3 The Consultant's general review during construction and inspection and testing by independent inspection and testing agencies reporting to the Consultant are both undertaken to inform the Owner of the Contractor's performance and shall in no way augment the Contractor's quality control or relieve the Contractor of its contractual responsibility.

3.3 NOTIFICATION

- .1 Prior to commencing significant segments of the Work, give the Consultant and Independent Inspection and Testing Companies appropriate notification so as to afford them reasonable opportunity to review the Work. Failure to meet this requirement may be cause for the Consultant to classify the Work as defective.

3.4 INSPECTION AND TESTING

- .1 The Owner will appoint the Independent Inspection and Testing Company to make inspections or perform tests as the Consultant directs. The Independent Inspection and Testing Company shall be responsible only to the Consultant, and shall make only such inspection or tests as the Consultant may direct.
- .2 Inspection and testing will include the testing of stud shear connectors.

3.5 DEFECTIVE MATERIALS AND WORK

- .1 Where evidence exists that defective Work has occurred or that Work has been carried out incorporating defective materials, the Consultant may have tests, inspections, or surveys performed such as concrete core strength tests, analytical calculations of structural strength, and the like, in order to help determine whether the Work must be replaced. Tests, inspections or surveys or calculations carried out under these circumstances will be made at the

Contractor's expense, regardless of their results, which may be such that, in the Consultant's opinion, the Work may be acceptable.

- .2 All testing shall be conducted in accordance with the requirements of the Building Code, except where this would in the Consultant's opinion cause undue delay or give results not representative of the rejected Products in place. In this case, the tests shall be conducted in accordance with the standards given by the Consultant.
- .3 Products or Work which fails to meet the specified requirements may be rejected by the Consultant whenever found at any time prior to the Total Performance of the work regardless of previous inspection. If rejected, defective materials or Work shall be removed and replaced or repaired to the satisfaction of the Consultant, promptly, at no expense to the Owner.

END OF SECTION 05 31 00

Part 1 General

1.1 SUMMARY

.1 Section Includes:

- .1 This section includes but not limited to, the following components:
 - .1 Studs subjected to lateral loads.
 - .2 Top and bottom tracks.
 - .3 Bridging and bracing.
 - .4 Top and bottom track connections to main structure, including fabrications to accommodate main structure deflections; top of wall anchor allowing for dead load deflections during construction and live load deflections after construction.
 - .5 Head, sill and jamb members at wall openings.
 - .6 Framing component connections.

.2 Related Requirements:

- .1 Section 01 35 00 – Delegated Design Submittals.
- .2 Section 03 30 00 – Cast-In-Place Concrete.
- .3 Section 06 10 00 – Rough Carpentry: Blocking for wall supported fixtures and fittings.
- .4 Section 07 27 13 – Modified Bituminous Air and Vapour Barrier.
- .5 Section 08 11 13 – Steel Doors and Frames.
- .6 Section 09 21 16 – Gypsum Board Assemblies

1.2 REFERENCES

.1 Definitions:

- .1 Minimum Uncoated Steel Thickness: Minimum uncoated thickness of lightweight steel framing shall be not less than 95% of the thickness used in the design for the framing system:
 - .1 Lesser thicknesses may be permitted at bends arising from the cold forming process.
 - .2 Metal thicknesses listed in this section are minimum uncoated steel thickness; exclusive of any subsequent coatings or treatments.
- .2 Delegated Design Professional Engineer: The professional engineer hired or contracted to the fabricator or manufacturer to design specialty elements, produce delegated design submittals and shop drawings to meet the requirements of the Project; who is registered in the province of the Work; and who is not the Consultant.
- .3 Letters of Commitment and Compliance: Documents prepared by the delegated design professional engineer as recommended by Professional Engineers Ontario, Responsibilities for Engineering Services for Building Projects.

.2 Reference Standards:

- .1 American Society for Testing and Materials International (ASTM):

- .1 ASTM A307-21, Standard Specification for Carbon Steel Bolts, Studs, and Threaded Rod 60,000 PSI Tensile Strength.
- .2 ASTM A653/A653M-23, Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.
- .3 ASTM A792/A792M-23, Standard Specification for Steel Sheet, 55% Aluminum-Zinc Alloy-Coated by the Hot-Dip Process.
- .4 ASTM C955-18e1, Standard Specification for Cold-Formed Steel Structural Framing Members.
- .5 ASTM F3125/F3125M-23, Standard Specification for High Strength Structural Bolts and Assemblies, Steel and Alloy Steel, Heat Treated, 120 ksi and 150 ksi Minimum Tensile Strength, and Metric Dimensions 830 MPa and 1040 MPa Minimum Tensile Strength.
- .2 Canadian General Standards Board (CGSB):
 - .1 CAN/CGSB 1.181-99, Ready-Mixed Organic Zinc-Rich Coating. (Withdrawn).

 - .2 CSA-G164-18 (R2023), Hot Dip Galvanizing of Irregularly Shaped Articles, Includes Update No. 1 (2020).
 - .3 CSA S16:19 Design of Steel Structures, Includes Errata (2019) and Errata (2023).
 - .4 CSA S136-16, North American Specification for the Design of Cold Formed Steel Structural Members.
 - .5 CSA W47.1:19, Certification of Companies for Fusion Welding of Steel.
 - .6 CSA W55.3-08 (R2023), Certification of Companies for Resistance Welding of Steel and Aluminum.
 - .7 CSA W59-18 (R2023), Welded Steel Construction, Includes Errata (2020).
- .6 The Master Painters Institute (MPI):
 - .1 Architectural Painting Specification Manual
 - .2 MPI # 18, Organic Zinc Rich Primer.

1.3 ADMINISTRATIVE REQUIREMENTS

- .1 Coordination: Coordinate work of this Section with work of other sections that may have items supported by or built into axially load bearing lightweight structural steel framing systems including; but not limited to doors, windows, architectural woodwork, pre-manufactured casework, building signage, plumbing fixtures, and electrical fixtures and panels.

1.4 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Product Data: Submit product data in accordance with Section 01 33 00 – Submittal Procedures.
 - .1 Submit product data for mechanical fasteners, indicating sizes, shear, and pull-over loading capacity where applicable. Provide data indicating thickness and type of corrosion protection coating.
- .2 Shop Drawings: Submit shop drawings in accordance with Section 01 33 00 – Submittal Procedures:
 - .1 Indicate design loads, member sizes, materials, design thickness exclusive of coatings, coating specifications, connection and bracing details, screw sizes and spacing, and anchors.
 - .2 Indicate locations, dimensions, openings and requirements of related work.
 - .3 Indicate welds by welding symbols as defined in CSA W59.
- .3 Submittals shall bear the seal of a professional engineer registered in the Province of the Work.
- .4 Delegated Design Submittals: Submit delegated design professional engineer's design notes and calculations upon request of the Consultant.
 - .1 Submit Letter of Commitment, signed and sealed by the professional engineer required by the Work of this Section in compliance with Section 01 35 00 – Delegated Design; professional engineer shall define applicable responsibilities in the completed Letter of Commitment and Letter of Compliance in compliance with the intent of the Building Code. Submit in conjunction with Shop drawings.
 - .2 Prior to declaration of Substantial Performance, submit Trade Contractor's design engineer to certify substantial compliance with the system design by submitting a Letter of Compliance, signed and sealed by the retained professional engineer required by the Work of this Section in compliance with Section 01 35 00 – Delegated Design.
- .5 Evaluation Reports:
 - .1 Submit steel framing manufacturer third-party evaluation report for the products reviewed to the local building code or its model code.
- .6 Qualifications: Submit evidence of welder qualifications specified in this Section.
- .7 Prior to declaration of Substantial Performance, submit Trade Contractor's design engineer to certify substantial compliance with the system design by submitting a Letter of Compliance, signed and sealed by the retained professional engineer required by the Work of this Section.

- .8 LEED Submittals: provide LEED submittals in accordance with Section 01 61 00 - LEED Product Requirements.

1.5 QUALITY ASSURANCE

- .1 Welding shall be performed by company certified by the Canadian Welding Bureau to CSA W47.1 for the type of work being performed; welding shall conform to CSA W59.
- .2 Clearly mark steel thickness exclusive of coating by embossing, stamping with indelible ink or by colour coding.
- .3 Provide minimum 72 hours notice to Consultant prior to commencement of work of this Section; increase notice period where time period spans weekends or statutory holidays.
 - .1 Do not conceal lightweight steel framing system until reviewed by Consultant.
- .4 Use manufacturers that manufacture Products in accordance with CSSBI Manufacturer Certification Requirements for Cold Formed Steel Framing Members.

1.6 DELIVERY, STORAGE, AND HANDLING

- .1 Protect steel studs during transportation, site storage and installation in accordance with CSSBI Sheet Steel Facts SSF 03.
- .2 Handle and protect galvanized materials from damage to zinc coating.
- .3 Store materials flat, blocked off the ground in a manner to prevent kinking or permanent set.
- .4 Bent, kinked or twisted studs and track will be rejected.
- .5 Packaging Waste Management
 - .1 Separate waste materials for recycling in accordance with Section 01 74 19 – Construction Waste Management.

Part 2 Products

2.1 PERFORMANCE / DESIGN CRITERIA

- .1 Design wall framing system to resist wind loads and building loads in accordance with Section 01 35 00 – Delegated Design.
- .2 Perform design, fabrication and erection of the work of this Section based on Limit States Design principles using factored loads and resistances, determined in accordance with CSA S136.
- .3 Conform to the requirements of indicated fire resistance ratings.
- .4 Design wall framing system capable of withstanding design loads within limits and under design loads indicated on Drawings, and as follows:
 - .1 Dead Loads: Weights of materials and construction.

- .2 Lateral Loads: Design for wind loads using post disaster importance factors listed in the Building Code for deflection and strength, modified by the appropriate exposure, gust and pressure (internal and external) factors in accordance with Building Code structural commentaries.
- .3 Design framing systems to provide for movement of framing members without damage or overstressing, sheathing failure, connection failure, undue strain on fasteners and anchors, or other detrimental effects when subject to a maximum ambient temperature change of 70°C.
- .4 Design framing system to maintain clearances at openings, to allow for construction tolerances, and to accommodate live load deflection of primary building structure upward and downward movement of 13 mm; or larger gap as may be required to accommodate structural movement.
- .5 Design deflection detail so that free floating vertical members are restrained from horizontal movement by means of continuous bridging, nested or boxed tracks, or sliding or flexible web connections.
- .6 Maximum allowable deflection under one in 50 year sustained wind loading shall be as follows:
 - .1 Behind metal cladding – stud deflection limited to L/360.
- .7 Allow for movement of the structure; design lightweight steel framing end connections to accommodate floor and roof deflections such that framing are not loaded axially; limit free play and movement in connections perpendicular to the plane of framing to ± 0.50 mm relative to the building structure.
- .8 Design connections between light steel framing members using bolts, welding or sheet metal screws.
- .9 Design bridging to prevent member rotation and member translation perpendicular to the minor axis, and as follows:
 - .1 Design for secondary stress effects due to torsion between lines of bridging.
 - .2 Collateral contribution of sheathing materials may be used to help restrain member rotation and translation perpendicular to the minor axis for wind bearing framing. Design exterior wall framing to accommodate horizontal deflection without allowing for collateral contribution of sheathing materials.
 - .3 Design bridging at 1530 mm centres maximum, closer spacing may be required by design to satisfy structural requirements; spaced at even intervals over the span of the member.
- .5 Stud, sill and top track sizes and thicknesses, and fastening details indicated in this Section and on the Drawings shall be considered as minimums only, spacing indicated as maximum permissible, except where changes are required to meet design criteria, and as follows:
 - .1 Design head, sill and jamb members to frame openings larger than 100 mm in any dimension.
 - .2 Design components or assemblies to accommodate specified tolerances of the structure.

- .3 Sill and Top Tracks:
 - .1 Double track system, outer track flanges with depth to suit vertical deflection and width of studs.
 - .2 Sill tracks, minimum 33 mm deep flanges and width of studs.
- .4 Movement Connection Clips: Purpose made clip designed to allow structural member vertical movement and to transfer wind suction or pressure to structural frame.
- .5 Maximum design spacing of stud members shall not exceed 305 mm centres. confirm stud spacing with Engineer prior to application.
- .6 Maximum spacing for top and bottom track connections to the structure shall not exceed 812 mm centres.
- .7 Minimum design thickness for wall framing members shall be as follows:
 - .1 64 mm: 0.836 mm
 - .2 92 mm: 0.836 mm
 - .3 101 mm: 0.836 mm
 - .4 140 mm: 0.836 mm
 - .5 152 mm: 0.836 mm
 - .6 184 mm: 0.91 mm
 - .7 203 mm: 1.12 mm
 - .8 Minimum thickness for walls supporting masonry veneer shall be 1.22 mm regardless of minimum thickness indicated above, or thicker as required to suit design conditions.
- .8 Bridging Channel: 1.22 mm minimum.
- .9 Clip Angles: 1.52 mm minimum.
- .6 Clearly mark steel thickness exclusive of coating by embossing, stamping with indelible ink or by colour coding.

2.2 MATERIALS

- .1 Steel: to CSA S136, fabricated from ASTM A653/A653M, Grade 230 steel.
- .2 Zinc coated steel sheet: quality to ASTM C955 and ASTM A653/A653M, with CP-60 Z180 for exterior wall assemblies designation coating. Consultant will accept hot dipped aluminum zinc alloy with AZM 150 designation coating in accordance with ASTM A792/A792M provided that corrosion protection meets or exceeds requirements established by ASTM A653/A653M.
- .3 Fasteners and Welding Materials:
 - .1 Welding materials conforming to CSA W59; electrodes minimum 480 MPa tensile strength.
 - .2 Bolts and nuts conforming to ASTM A307, with washers and hot-dip galvanized finish.
 - .3 Metal to Metal: Sheet metal screws conforming to ASME B18, with minimum 0.008 mm thick galvanized coating and #8 Ø; self-drilling, self-threading, case hardened type; hex, pan, and low-profile head profile type to suit application; length sufficient to penetrate not less than three fully exposed threads beyond joined materials.

- .4 Metal to Concrete: Hilti drilled insert, minimum 8 mm Ø; do not use Powder Actuated Fasteners.
- .5 Metal to Structural Steel: Secure track to structural steel over 8 mm thickness with Hilti DX fastening system with ENH2-21L15MX nails.
- .6 Concrete-to-Steel Top Track Corrugated Ties: Corrugated steel conventional strip tie; 22 mm wide x 100 mm total length including 20 mm up stand x 0.76 mm nominal core metal thickness, hot dip galvanized; corrugations 2.5 mm deep x 10 mm apart; meeting requirements of CSA A370:
 - .1 Basis-of-Design Materials:
 - .1 Conventional Corrugated Strip Tie, Fero Corporation.
- .7 Drilled Inserts: Steel, cadmium plated or hot dipped galvanized, sizes as indicated on Drawings.
- .4 Touch up primer: zinc rich, to CAN/CGSB 1.181.
- .5 Moisture Barrier: Insulating moisture resistant 6 mm thick foam strip x width of framing member, length as required.
 - .1 Basis-of-Design Materials:
 - .1 Ethafoam 222, The Dow Chemical Company.
- .6 Thermal Insulation: as indicated in Section 07 21 13 – Board Insulation.
- .7 Shims: Load bearing, high density multi-monomer plastic, non-leaching.

2.3 STEEL STUD DESIGNATIONS

- .1 Colour code: to CSSBI Technical Bulletin Vol.7, No. 2.

2.4 METAL FRAMING

- .1 Framing Components: Provide framing components in metal core thickness, profiles and spacing as determined by delegated design professional engineer including; but not limited to, the following:
 - .1 C-shaped, punched wall framing with stiffened flanges
 - .2 U-shaped un-punched track without stiffened flanges
 - .3 Headers and jambs; columns, posts and beams using manufacturer's proprietary shapes having stiffened flanges
 - .4 Vertical deflection clips using manufacturers proprietary bypass or head clips; as appropriate to installation, capable of accommodating upward and downward vertical movement of primary structure using a positive mechanical attachment to wall framing web
 - .5 Slotted or double deep leg deflection track using manufacturer's proprietary system allowing free vertical movement under primary structural elements
 - .1 Basis-of-Design Materials:
 - .1 BlazeFrame DSL or MaxTrak Slotted Deflection Track as required, ClarkDietrich
 - .6 Leg Dimension: as required by delegated design professional engineer.

- .7 Minimum Thickness: as required by delegated design professional engineer.
- .8 Floor joist framing and rim track
- .9 Roof joists framing.
- .10 Roof rafter framing.
- .11 Ceiling joist framing.
- .2 Framing Accessories: Provide accessories of manufacturer's standard thickness and configuration including; but not limited to, the following:
 - .1 Supplementary framing.
 - .2 Drift clips.
 - .3 Bracing, bridging, and solid blocking.
 - .1 Basis-of-Design Materials:
 - .1 Spazzer 5400 Bridging Bar (SPZS), ClarkDietrich;
 - .4 Web stiffeners
 - .1 Basis-of-Design Materials:
 - .1 Quick Twist Web Stiffener (QTWS), ClarkDietrich
 - .5 Anchor clips
 - .1 Basis-of-Design Materials:
 - .1 Holdown (CD Series) or Moment Clip (MC Series), ClarkDietrich;
 - .6 End clips.
 - .7 Foundation clips.
 - .8 Gusset plates.
 - .9 Stud kickers, knee braces, and girts.
 - .10 Joist hangers and end closures.
 - .1 Basis-of-Design Materials:
 - .1 Universal Joist Hanger (UJH), ClarkDietrich
 - .11 Hole reinforcing plates.
 - .12 Backer plates.

2.5 SOURCE QUALITY CONTROL

- .1 Ensure mill reports covering material properties are reviewed by Consultant.

Part 3 Execution

3.1 GENERAL

- .1 Do welding in accordance with CSA W59.
- .2 Certification of companies: CSA W47.1 for fusion welding and CSA W55.3 for resistance welding.
- .3 Do work to CSSBI S5.

3.2 ERECTION

- .1 Erect components to requirements of reviewed shop drawings.
- .2 Anchor tracks securely to structure at 800 mm on centre maximum, unless lesser spacing prescribed on shop drawings.
- .3 Erect studs plumb, aligned and securely attached with two screws minimum, welded in accordance with manufacturer's recommendations.
- .4 Seat studs into bottom tracks and two piece telescoping top track.
- .5 Install 50 mm minimum telescoping track at top of walls where required to accommodate vertical deflection.
 - .1 Nest top track into deflection channel minimum of 30 mm and maximum of 40 mm.
 - .2 Do not fasten tracks together.
 - .3 Stagger joints.
- .6 Install studs at not more than 50 mm from abutting walls, openings, and each side of corners and terminations with dissimilar materials.
- .7 Brace steel studs with horizontal internal bridging at 1500 mm maximum.
 - .1 Fasten bridging to steel clips fastened to steel studs with screws or by welding.
- .8 Frame openings in stud walls to adequately carry loads by use of additional framing members and bracing as detailed on shop drawings.
- .9 Touch up welds with coat of zinc rich primer.

3.3 ERECTION TOLERANCES

- .1 Plumb: not to exceed 1/500th of member length.
- .2 Camber: not to exceed 1/1000th of member length.
- .3 Spacing: not more than +/- 3.0 mm from design spacing.
- .4 Gap between end of stud and track web: not more than 4.0 mm.

3.4 CUTOUTS

- .1 Maximum size of cutouts for services as follows:

Member Depth	Across Member Depth	Along Member Length	Centre to Centre Spacing (mm)
92	40 max.	105 max.	610 min.
102	40 max.	105 max.	610 min.
152	64 max.	114 max.	610 min.
- .2 Limit distance from centerline of last unreinforced cutout to end of member to no less than 305 mm.

END OF SECTION

Part 1 General

1.1 SUMMARY

- .1 This Section Includes Metal Fabrications as indicated on drawings.
- .2 Related Requirements:
 - .1 Section 01 35 00 – Delegated Design
 - .2 Section 03 30 00 – Cast-in-Place Concrete
 - .3 Section 04 22 00 – Unit Masonry
 - .4 Section 05 31 00 – Steel Deck
 - .5 Section 05 51 29 – Metal Stairs and Ladders
 - .6 Section 06 10 00 – Rough Carpentry
 - .7 Section 06 40 00 – Architectural Woodwork
 - .8 Section 09 21 16 – Gypsum Board Assemblies
 - .9 Section 09 91 00 – Painting

1.3 ADMINISTRATIVE REQUIREMENTS

- .1 Pre-Installation Meetings: convene pre-installation meeting in accordance with Section 01 31 19 – Project Meetings to:
 - .1 Verify project requirements.
 - .2 Review installation and substrate conditions.
 - .3 Co-ordination with other building subtrades.
 - .4 Review manufacturer's installation instructions.

1.4 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Submit product data in accordance with Section 01 33 00 – Submittal Procedures:
 - .1 Submit manufacturer's printed product literature, specifications and data sheets.
 - .2 Provide one electronic copy of WHMIS SDS - Safety Data Sheets in accordance with WHMIS acceptable to Labour Canada, and Health and Welfare Canada and indicate VOC content for:
 - .1 Finishes, coatings, primers and paints.
- .2 Submit shop drawings in accordance with Section 01 33 00 – Submittal Procedures:

- .1 Indicate materials, finishes, profiles, core thicknesses, connections, joints, sizes of sections, method of anchorage, number of anchors, supports, fasteners, rivets, welds, reinforcement, details, and accessories.
- .2 For items where design is delegated to fabricator, provide shop drawings signed and sealed by the professional engineer registered in Province of Work, responsible for the design as indicated in Section 01 35 00 - Delegated Design.
- .3 Submittals shall bear the seal of a professional engineer registered in the Province of the Work.
- .4 Submit delegated design professional engineer's design notes and calculations upon request of the Consultant.
- .5 Submit Letter of Commitment, signed and sealed by the professional engineer required by the Work of this Section in compliance with Section 01 35 00 – Delegated Design Submittals; professional engineer shall define applicable responsibilities in the completed Letter of Commitment and Letter of Compliance in compliance with the intent of the Building Code. Submit in conjunction with Shop drawings.
- .6 Submit evidence of welder qualifications specified in this Section.
- .7 Prior to declaration of Substantial Performance, submit subcontractor's design engineer to certify substantial compliance with the system design by submitting a Letter of Compliance, signed and sealed by the retained professional engineer required by the Work of this Section in compliance with Section 01 35 00 – Delegated Design Submittals.
- .8 LEED Submittals: provide LEED submittals in accordance with Section 01 61 01 - LEED Product Requirements.

1.5 QUALITY ASSURANCE

- .1 Fabricator Qualifications: A firm experienced in producing metal fabrications similar to those indicated for this Project and with a record of successful in-service performance, as well as sufficient production capacity to produce required units.
- .2 Welding: Qualify procedures and personnel according to the following:
 - .1 Welders shall be qualified by Canadian Welding Bureau for classification of work being performed.
 - .2 The fabricator shall be certified to CSA W47.1, Division 1 or 2.1.
 - .3 Do welding inspection to CSA W178.1 and W178.2.
 - .4 Resistance welding: to CSA W55.3.
 - .5 Fusion welding: to CSA W59.
- .3 Test Reports: Certified test reports showing compliance with specified performance characteristics and physical properties.
- .4 Certificates: Product certificates signed by manufacturer certifying materials comply with specified performance characteristics and criteria and physical requirements.
- .5 Detail and fabricate metal fabrications in accordance with the NAAMM AMP 555.

- .6 Perform Work to the highest standard of modern shop and field practice, by personnel experienced in this Work. Accurately fit joints and intersecting members in true planes with adequate fastening. Build and erect the Work plumb, true, square, straight, level, accurate to the sizes shown, and free from distortion or defects.

1.6 DELIVERY, STORAGE, AND HANDLING

- .1 Exercise due care in storing, handling and erecting all materials and support all materials properly at all times so that no piece will be bent, twisted or otherwise damage structurally or visibly.
- .2 Correct damaged material and where the Consultant deems damage irreparable, replace the affected items at no additional expense to the Consultant or Owner.
- .3 Apply protective covering to face of all exposed finished metalwork before it leaves shop, covering to remain until item installed.
- .4 Fabricate large assemblies so they can be safely and easily transported and handled to their place of installation.
- .5 Packaging Waste Management:
 - .1 Separate and recycle waste materials in accordance with Section 01 74 19 – Construction Waste Management.

1.7 SITE CONDITIONS

- .1 Coordinate this Work with the remainder of the Work and exercise the necessary scheduling to ensure that all Work is carried out and all items incorporated during the appropriate construction phase.
- .2 Provide instructions and drawings to other trades for setting bearing plates, anchors bolts, and other members that are built in to work of other trades.
- .3 Protect other Sections of the Work from damage by this Section of the Work.

Part 2 Products

2.1 MATERIALS

- .1 Steel sections and plates: to CSA-G40.20/G40.21, Grade 300W.
- .2 Hollow Structural Sections: In accordance with CSA G40.20/G40.21, Grade 350W, Class C.
- .3 Steel pipe: to ASTM A53/A53M, standard weight (Schedule 40), unless another weight is indicated or required by structural loads, galvanized finish.
- .4 Steel Tubing: ASTM A500/500M, Grade B or ASTM A501/501M.
- .5 Welding materials: to CSA W59.
- .6 Welding electrodes: to CSA W48 Series.
- .7 Fasteners: Bolts, nuts, washers, rivets, lock washers, anchor bolts, machine screws, and machine bolts.

- .1 Unfinished fasteners: In areas not exposed to public, use unfinished bolts conforming to ASTM A307, Grade A, with hexagon heads and nuts. Supply bolts of lengths required to suit the thickness of the material being joined, but not projecting more than 6 mm beyond nut, without the use of washers.
- .2 Finished fasteners:
 - .1 In areas exposed to public use, bolts, nuts, washers, rivets, lock washers, anchor bolts, machine screws and machine bolts to be hot dip galvanized in accordance with ASTM A153/A153M or CSA-G164.
 - .2 For joining stainless steel components use stainless steel fasteners of same type.
- .8 Structural bolts: to ASTM F3125/F3125M.
- .9 Stainless steel fasteners, washers and nuts: to ASTM F593, 18-8 austenitic stainless steel (Grade 8 - B8/B8A), sized as required for purpose intended, or as otherwise indicated. Cold finished: Condition B, cold worked, per ASTM A276/A276M.
- .10 Grout: non-shrink, non-metallic, non-corrosive flowable, 15 MPa at 24 hours.

2.2 FABRICATION

- .1 Fabricate work square, true, straight and accurate to required size, with joints closely fitted and properly secured.
- .2 Use self-tapping shake-proof flat, round, or oval headed screws on items requiring assembly by screws or as indicated.
- .3 Where possible, fit and shop assemble work, ready for erection.
- .4 Ensure exposed welds are continuous for length of each joint. File or grind exposed welds smooth and flush. Seal exterior steel fabrications to provide corrosion protection in accordance with CSA S16.
- .5 Welding is to conform to CSA W59 and the fabricator certified to CSA W47.1. Include for welding inspection in the Contract.
- .6 File or grind all exposed welds smooth and flush. Repair or fill all pits, cracks and holes. Grind and polish all handrails to a smooth, even surface. Smooth all inside corners, returns.
- .7 Insulate when necessary to prevent electrolysis due to metal to metal contact or metal to masonry or concrete contact. Use bituminous paint or other approved method.
- .8 Provide fastenings, including anchor bolts, bolts, lag screws, expansion bolts, straps, brackets, etc. required for the fabrication and erection of work of this Section.

2.3 FINISHES

- .1 Provide LEED compliant coatings for VOC ratings.
- .2 Prior to priming steel, prepare all surfaces in conformance with SSPC SP-3 – Power Tool Cleaning for non-exposed locations and any overhead steel not subject to contact, SSPC SP-5 – White-metal Blast Cleaning for exposed

architectural finished locations, and SSPC SP7- Brush of Blast Cleaning for hand and guard rails. Adjust blast grit to suit primer coat thickness specified in Section 09 91 00 – Painting.

- .3 Hot dip galvanizing: galvanize steel, where indicated, to ASTM A123/A123M, minimum zinc coating of 600 g/m². (Severe, unprotected exposures).
- .4 Electrolytic galvanizing: galvanize steel, where indicated, to ASTM A591/A591M, minimum zinc coating of 180 g/m². (Non-severe, unprotected exposures).
- .5 Wipe coat galvanizing: galvanize steel, where indicated to CSA G189, minimum zinc coating of 75 g/m². (Non-severe, protected exposures)
- .6 Shop Primers: Provide primers that are compatible with paint systems specified.
- .7 Touch up galvanized surfaces with zinc rich coating, to ASTM A780/A780M: NPFC-MIL-P-21035 zinc rich paint, minimum DFT 8 mils.
- .8 Zinc Rich Paint: Conforming to NPFC-MIL -P-21035 zinc rich paint.
 - .1 Clean metal to equivalent of commercial sand blast SSPC-SP6, remove sandblast in residue.
 - .2 Apply one coat of zinc rich paint to surfaces exposed after assembly to minimum dry film thickness of 60 µm (2.5 mil). Apply coating immediately after cleaning and over primer.
- .9 Isolation Coating: Apply an isolation coating to contact surfaces in contact with cementitious materials, wood materials and dissimilar metals except stainless steel.
- .10 Paint: Prepare the Work and paint in accordance with CSA-S16, primed ready for site finish as specified in Section 09 91 00 – Painting. Leave surfaces to be welded unpainted.

2.4 ROUGH HARDWARE

- .1 Furnish bent or otherwise custom fabricated bolts, plates, anchors, hangers, dowels, and other miscellaneous steel and iron shapes as required. Fabricate items to sizes, shapes, and dimensions required.

2.5 MISCELLANEOUS FABRICATIONS

- .1 Miscellaneous Framing and Supports: Provide steel framing and supports for applications indicated that are not a part of structural steel framework, as required to complete work.
- .2 Fabricate units to sizes, shapes, and profiles indicated and required to receive adjacent other construction retained by framing and supports. Fabricate from structural steel shapes, plates, and steel bars of welded construction using mitred joints for field connection. Cut, drill, and tap units to receive hardware, hangers, and similar items.
- .3 Equip units with integrally welded anchors for casting into concrete or building into masonry. Furnish inserts if units must be installed after concrete is placed.

- .4 Miscellaneous Steel Trim: Provide shapes and sizes indicated for profiles shown. Unless otherwise indicated, fabricate units from structural steel shapes, plates, and steel bars, with continuously welded joints and smooth exposed edges. Use concealed field splices wherever possible. Provide cutouts, fittings, and anchorages as required for coordination for assembly and installation with other work.

2.6 PIPE BOLLARDS

- .1 Fabricate pipe bollards from Schedule 40 steel pipe and as indicated on Drawings.
- .2 Concrete Fill: comply with requirements of Section 03 30 00 - Cast-in-Place Concrete.
- .3 Fabricate interior bolt down pipe bollards from 152 mm nominal outside diameter, Schedule 40 steel pipe.
- .4 Paint bollards after fabrication, colour as indicated on Drawings.
- .5 Provide dome top bollard covers for exterior bollards.
 - .1 Material: 3.2 mm thick high density polyethylene (HDPE).
 - .2 Colour: as indicated on Drawings.
 - .3 Acceptable Materials:
 - .1 Post Guard, Sure Guard.

2.7 GUARDRAIL AND POSTS

- .1 Fabricate guardrails from 3.43 mm thick 305 mm wide x 76 mm deep galvanized steel w-beam with post bolt slots at 3810 mm o.c. or as required by Manufacturer. Flare end sections and offset support blocks as required by Manufacturer.
- .2 Provide W150 x 14 posts galvanized steel and as indicated on Drawings.
- .3 Coordinate with Electrical to provide exterior receptacles for block heaters.
- .4 Basis of Design Materials:
 - .1 W-Beam Rail and Post and Offset Block, Ontario Bollards, Total Protection Specialists

Part 3 Execution

3.1 INSTALLATION

- .1 Install Work in accordance with manufacturer's/fabricator's written instructions and Contract Documents.
- .2 Do welding work in accordance with CSA W59 unless specified otherwise.
- .3 Supply finished items to be built in to those trades along with instructions for proper installation.
- .4 Apply architectural metal work using hidden mechanical fasteners. Installation shall be by skilled Architectural metal workers experienced in highest quality work.

- .5 Fasteners to draw adjoining sections together in proper, true alignment, and are capable of field adjustment.
- .6 All fasteners, mountings to be non-loosening and installed so that they will be hidden at completion.
- .7 Install all Work to true, straight lines, accurate to profile, all properly aligned.
- .8 Isolate dissimilar metals in a manner approved by the Consultant to prevent electrolytic action or corrosion.
- .9 Install finish hardware supplied under other Sections required for completion of components of this Section.
- .10 Erect metalwork square, plumb, straight, and true, accurately fitted, with tight joints and intersections.
- .11 Provide suitable means of anchorage acceptable to Consultant such as dowels, anchor clips, bar anchors, expansion bolts and shields, and toggles.
- .12 Make field connections with high tensile bolts to CSA-S16 and weld to prevent loosening.
- .13 Hand items over for casting into concrete or building into masonry to appropriate trades together with setting templates.
- .14 Touch-up rivets, field welds, bolts and burnt or scratched surfaces after completion of erection with primer.
- .15 Repair galvanized areas damaged by welding, flame cutting or during handling, transport or erection in accordance with ASTM A780/A780M. Touch-up with organic zinc-rich paint to NPFC-MIL-P-21035 zinc rich paint, minimum DFT 8 mils.

3.2 PIPE BOLLARDS

- .1 Anchor exterior bollards in place with concrete footings. Support and brace bollards in position in footing excavations until concrete has been placed and cured.
- .2 Fill bollards solidly with concrete, mounding top surface.
- .3 Install bollard covers on exterior bollards.
- .4 Anchor interior bollards in place with bolt anchors.

3.3 GUARDRAILS AND POSTS

- .1 Install guardrails and posts as indicated on Drawings.
- .2 Set posts in concrete as indicated on Drawings.

3.4 MISCELLANEOUS ITEMS

- .1 Provide steel angle frame, hanging rods and bracing for supporting bulkheads and shelving.
- .2 Provide bracket backing supports for vanities.
- .3 Steel angle masonry supports as detailed.

- .4 Supply and install miscellaneous metal items as indicated or specified, or as otherwise required for a complete job, in accordance with the design intent of the project.

3.5 CLEANING

- .1 Perform cleaning after installation to remove construction and accumulated environmental dirt.
- .2 Upon completion of installation, remove surplus materials, rubbish, tools and equipment barriers.

END OF SECTION

Part 1 General

1.1 SUMMARY

- .1 This Section Includes the following:
 - .1 Handrails and railings attached to metal stairs.
- .2 Related Requirements:
 - .1 Section 01 35 00 – Delegated Design
 - .2 Section 03 30 00 – Cast-in-Place Concrete
 - .3 Section 05 50 00 – Metal Fabrications
 - .4 Section 09 91 00 – Painting

- .2 Definitions:
 - .1 Usage Classifications: NAAMM AMP 510 provides four usage classifications for finishing of metal stair and railing systems as follows:

- .1 Industrial Class: NAAMM Industrial Class stairs are purely functional in character, design for interior or exterior locations for industrial or fire escape applications, primarily for use by building occupants only; not including stairs integral with industrial equipment.
- .2 Service Class: NAAMM Service Class stairs are intended for use in enclosed stairways and to provide a secondary or emergency means of travel between floors or levels in a multi-storey building, primarily for use by building occupants, tenants and the public.
- .3 Commercial Class: NAAMM Commercial Class stairs are intended for use in enclosed stairways to provide primary means of travel between floors or levels in a multi-storey institutional or commercial building where appearance and finish are important considerations.
- .4 Architectural Class: NAAMM Architectural Class stairs are intended to serve as an architectural feature and can be located in either an open area or in an enclosed stairway in an institutional or commercial building where appearance and finish are of prime importance.

1.3 ADMINISTRATIVE REQUIREMENTS

- .1 Pre-Installation Meetings: convene pre-installation meeting in accordance with Section 01 31 19 – Project Meetings to:
 - .1 Verify project requirements.
 - .2 Review installation and substrate conditions.
 - .3 Co-ordination with other building subtrades.
 - .4 Review manufacturer's installation instructions.

1.4 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Submit product data in accordance with Section 01 33 00 – Submittal Procedures:
 - .1 Submit manufacturer's printed product literature, specifications and data sheets.
 - .2 Provide electronic copy of WHMIS SDS - Safety Data Sheets in accordance with WHMIS acceptable to Labour Canada, and Health and Welfare Canada and indicate VOC content for:
 - .1 Finishes, coatings, primers and paints.
- .2 Submit shop drawings in accordance with Section 01 33 00 – Submittal Procedures:
 - .1 Indicate finishes, accessories, construction details, profiles, sizes of steel sections and thickness of steel sheet.
 - .2 Indicate fasteners, welds and connection details between stringers; treads; risers; headers; newels; platforms; struts, columns and hangers; railings; handrails; brackets; reinforcements; anchors; and welded and bolted connections.
 - .3 Drawings to include plans, sections, elevations and dimensions.

- .3 Delegated design submittals: Submit shop drawing and submittals bearing stamp and signature of a qualified professional engineer registered in Province of the Work.
- .4 LEED Submittals: provide LEED submittals in accordance with Section 01 61 01 - LEED Product Requirements.

1.5 QUALITY ASSURANCE

- .1 Qualifications:
 - .1 Use a fabricator experienced in producing metal fabrications similar to those indicated for this Project and with a record of successful in-service performance, as well as sufficient production capacity to produce required units.
 - .2 Welders shall be qualified by Canadian Welding Bureau for classification of Work being performed.
 - .3 Welding of load supporting components shall be performed by companies certified by Canadian Welding Bureau in accordance with CSA W47.1.
- .2 Test Reports: Certified test reports showing compliance with specified performance characteristics and physical properties.
- .3 Retain a Professional Engineer, registered in the Province of the work, for the design, fabrication, and erection of the work of this Section in accordance with applicable Building Code and Contract Documents requirements including, but not limited to, the following:
 - .1 Seal and signature to shop drawings and design submittals.
 - .2 Field review of installed components.
 - .3 Completion of Letters of Commitment and Supervision specified in Section 01 35 00 - Delegated Design.
- .4 Certificates: Product certificates signed by manufacturer certifying materials comply with specified performance characteristics and criteria and physical requirements.

1.6 DELIVERY, STORAGE, AND HANDLING

- .1 Store materials in a location and manner to avoid damage; stack materials to prevent bending or applying stress to components; keep handling of materials on-site to a minimum.
- .2 Store components and materials in clean, dry location, away from uncured concrete or masonry; cover with waterproof paper, tarpaulin or polyethylene sheeting in a manner that permits air circulation inside of covering.
- .3 Correct damaged material and where damage is deemed irreparable by the Owner, replace the affected item at no additional expense to the Owner.
- .4 Apply protective covering to face of all exposed finished metalwork before it leaves shop, covering to remain until item installed and ready for final finishing.
- .5 Fabricate large assemblies so they can be safely and easily transported and handled to their place of installation.
- .6 Packaging Waste Management

- .1 Separate and recycle waste materials in accordance with Section 01 74 19 – Construction Waste Management.

Part 2 Products

2.1 PERFORMANCE/DESIGN CRITERIA

- .1 Provide delegated design in accordance with Section 01 35 00 - Delegated Design.
- .2 Design Requirements:
 - .1 Design metal stair, balustrade and landing construction and connections in accordance with Building Code as indicated for vertical and horizontal live load requirements.
 - .2 Detail and fabricate stairs to NAAMM Metal Stairs Manual.
 - .3 Design grating treads in accordance with NAAMM Metal Bar Grating Manual.
 - .4 Design pipe railings in accordance with NAAMM Pipe Railing Manual.
 - .5 Perform work in accordance with ASTM E985, Permanent Metal Railing Systems and Rails for Buildings.

2.2 MATERIALS

- .1 Carbon Steel:
 - .1 Steel sections and plates: to CSA-G40.20/G40.21, Grade 300W.
 - .2 Hollow Structural Sections (HSS): In accordance with CSA G40.20/G40.21, Grade 350W, Class C.
 - .3 Steel plate: to CSA-G40.20/G40.21, Grade 300W.
 - .4 Metal bar grating: to NAAMM MBG 531, steel, Type W-19-4, with checkered plate nosings.
 - .5 Steel pipe: to ASTM A53/A53M, standard weight, schedule 40 seamless black.
 - .6 Steel tubing: to ASTM A500/A500M, 6 mm wall thickness, sizes and dimensions as indicated.
- .2 Welding materials: to CSA W59.
- .3 Welding electrodes: to CSA W48 Series.
- .4 Bolts: to ASTM A307.
- .5 High strength bolts: to ASTM F3125/F3125M.

2.3 PIPE/TUBING BALUSTRADES

- .1 Construct balusters and handrails from steel pipe and steel tubing as detailed on Drawings to commercial class as defined by NAAMM AMP 510.
- .2 Cap and weld exposed ends of balusters and handrails.
- .3 Provide texture change within the last 300 mm of the handrail in accordance with accessible guidelines.

- .4 Terminate at abutting wall with end flange.
- .5 Fabricate railings in accordance with NAAMM AMP 521 to finish as follows:
 - .1 Fabrication Tolerance: Fabricate steel to one half the normal tolerance as specified in the CISC/AISC Code of Standard Practice Section 10.
 - .2 Welds Ground Smooth: Fabricator shall grind welds of exposed steel smooth; make groove welds flush to the surfaces each side and be within +1.5 mm, -0 mm of plate thickness.
 - .3 Contour and blend of welds where fillet welds are ground contoured, or blended, oversize welds as required and grind to provide a smooth transition and to match profile on accepted sample.
 - .4 Continuous weld where noted of uniform size and profile.
 - .5 Minimize weld show through at locations where welding on the far side of an exposed connection occurs, grind distortion and marking of the steel to a smooth profile with adjacent material.
 - .6 Maintain a uniform gap of 3 mm \pm 0.8 mm at copes and blocks.
 - .7 Maintain a uniform gap tolerance of 3 mm \pm 0.8 mm at connections.
 - .8 Fabricate exposed steel so that piece marks are fully hidden in the final structure or made with media to permit full removal after erection.
 - .9 Deliver steel with no mill marks (stencilled, stamped, raised) in exposed locations; cut off mill material to appropriate lengths where possible; fill or grind to a surface finish consistent with the accepted sample where cutting is not possible.
 - .10 Grind edges of sheared, punched or flame-cut steel to match accepted sample.
 - .11 Rolled members shall be fully shaped in the shop and tied during shipping to prevent stress relieving; distortion of the web or stem, and of outstanding flanges or legs of angles will be visibly acceptable to the Consultant when viewed from a distance of 6100 mm under any lighting condition; tolerances for the vertical and horizontal walls of rectangular HSS members after rolling shall be \pm 13 mm.
 - .12 Seal weld open ends of round and rectangular hollow structural section with 10 mm closure plates; provide continuous, sealed welds at angle to gusset plate connections and similar locations where exposed steel is exposed to weather.
- .6 Fabricate work square, true straight and accurate to required size, with joints closely fitted and properly secured.
- .7 Where work of other Sections is attached to work of this section, prepare work by drilling and tapping holes as required facilitating installation of such work.

2.4 ACCESS LADDERS

- .1 Provide premanufactured ladder **or** manufacture on site as indicated.
- .2 Construct access ladders in accordance with local OH&S safety codes.
- .3 Roof Access Ship Ladder:
 - .1 Width: in accordance with Ontario Building Code
 - .2 Slope: as indicated on Drawings.

- .3 Rise: uniform risers in accordance with Ontario Building Code
- .4 Tread: minimum 100 mm wide with 20 mm overlap. At top landing form tread 100 mm wide, level with landing.
- .5 Construct with 2.78 mm minimum bent plate or steel channel stringers and grating treads, welded.
- .6 Rail Stanchions: 50 mm diameter HSS tube
- .7 Include 32 mm outside Ø pipe handrails both sides.
- .8 Rail Design; provide a single handrail on both sides of the ladder. The distance between rails, from center to center, to be not less than 540 mm. Stanchions supporting handrails should be positioned at right angles to stringers. The rail to be 250 mm above the pitch line for ladders of 65° slope and 100 mm above the pitch line for ladders of 75° slope. At the top of a ships ladder, handrails should widen out to a minimum width of 610 mm centre to centre clearances; The minimum clear space on the user side of a companion way ships ladder, measured at right angles to the strings, to be 1200 mm. The front edge of the first step down from platform level to be a minimum of 250 mm from any vertical wall or other obstruction.
- .9 Usage Classification: Service
- .10 Finish: Galvanized

2.5 FABRICATION

- .1 Fabricate stairs in accordance with NAAMM AMP 510.
- .2 Fabricate railings in accordance with NAAMM AMP 521.
- .3 Fabricate gratings to NAAMM MBG 531.
- .4 Weld connections where possible, otherwise bolt connections. Countersink exposed fastenings, cut off bolts flush with nuts. Make exposed connections of same material, colour and finish as base material on which they occur.
- .5 Accurately form connections with exposed faces flush; mitres and joints tight. Make risers of equal height.
- .6 Grind or file exposed welds and steel sections smooth.
- .7 Shop fabricate stairs in sections as large and complete as practicable.
- .8 Insulate dissimilar materials to prevent electrolysis arising from metal to metal contact or metal to masonry or concrete contact; use bituminous paint or other acceptable method acceptable to Consultant.

2.6 FINISHES

- .1 Provide LEED compliant coatings for VOC ratings.
- .2 Galvanizing: hot dipped galvanizing with zinc coating 600 g/m² to CSA-G164.
- .3 Shop Primers: Provide primers that are compatible with paint systems specified.
- .4 Touch-up galvanized surfaces with zinc rich coating, to ASTM A780/A780M: NPFC-MIL-P-21035 zinc rich paint, minimum DFT 8 mils.
- .5 Painting: in accordance with Section 09 91 00 – Painting.

2.7 SHOP PAINTING

- .1 Clean surfaces in accordance with Steel Structures Painting Council Manual Volume 2.
- .2 Apply one coat of shop primer except interior surfaces of pans.
- .3 Apply two coats of primer of different colours to parts inaccessible after final assembly.
- .4 Use primer as prepared by manufacturer without thinning or adding admixtures. Paint on dry surfaces, free from rust, scale, and grease. Do not paint when temperature is below 7 degrees C.
- .5 Do not paint surfaces to be field welded.

2.8 ACCESSORIES

- .1 Sealant: in accordance with Section 07 92 00 – Sealants.

Part 3 Execution

3.1 PREPARATION

- .1 Provide anchorage devices and fasteners to other Sections where necessary for securing metal stairs to in place construction; include threaded fasteners for concrete and masonry inserts, through-bolts, lag bolts, and other connectors.
- .2 Perform cutting, drilling, and fitting required for installing metal stairs.
- .3 Field check and verify that structural framing, enclosures, weld plates, blocking, and pocket sizes and locations are placed in accordance with reviewed shop drawings.
- .4 Report discrepancies to Contractor and Consultant, and recommend corrective action by responsible parties.
- .5 Provide temporary bracing or anchors in formwork for items that are to be built into concrete, masonry, or similar construction.
- .6 Hand items over for casting into concrete or building into masonry to appropriate trades together with setting templates and instructions for installation.

3.2 INSTALLATION OF STAIRS

- .1 Install in accordance with NAAMM, Metal Stair Manual.
- .2 Install grating treads, stringers, landings, hanger assemblies, closures, balustrades, handrails, and guards, level, plumb, square, complete, accurately fitted, with tight joints and intersections, in the proper locations and positions, structurally sound, securely fastened, and free from detrimental defects. Weld connections between handrails and balusters and in lengths of handrails. Weld balustrades to steel stairs or steel plates as required. Secure wall handrails to walls.
- .3 Install plumb and true in exact locations, using welded connections wherever possible to provide rigid structure. Provide anchor bolts, bolts and plates for connecting stairs to structure.

- .4 Hand items over for casting into concrete or building into masonry to appropriate trades together with setting templates.
- .5 Do welding work in accordance with CSA W59 unless specified otherwise.
- .6 Touch up shop primer to bolts, welds, and burned or scratched surfaces at completion of erection.
- .7 Repair damage to adjacent materials caused by metal stairs and ladders installation.

3.3 INSTALLATION OF GUARDRAILS, RAILING AND HANDRAILS

- .1 Install guardrails, railings, and handrails as indicated, including all sleeves, anchors and connections. Prepare steel, and shop prime exposed components. Field prime as required to maintain cover of exposed steel.
- .2 Install in accordance with NAAMM, Metal Stair Manual.
- .3 Adjust railings prior to anchoring to ensure matching alignment at abutting joints. Space posts at spacing indicated, or if not indicated, as required by design loadings. Plumb posts in each direction. Secure posts and railing ends to building construction as follows:
 - .1 Anchor posts in concrete by means of pipe sleeves preset and anchored into concrete. After posts have been inserted into sleeves, fill annular space between post and sleeve solid with non-shrink, non-metallic grout, mixed and placed to comply with anchoring material manufacturer's directions.
 - .2 Anchor posts and rail ends to steel with welded connections, unless otherwise indicated.
 - .3 Anchor posts and rail ends into concrete and masonry with steel round flanges welded to post and rail ends, and anchored into wall construction with expansion shields and bolts.
 - .4 Install removable railing sections where indicated in slip-fit metal sockets cast into concrete. Accurately locate sockets to match post spacing.
- .4 Secure handrails to wall with wall brackets and end fittings. Provide bracket with not less than 50 mm clearance from inside face of handrail and finished wall surface. Locate brackets at spacing not less than 1.5 m o.c., unless otherwise indicated. Secure wall brackets and wall return fittings to building construction as follows:
 - .1 Use type of bracket with flange tapped for concealed anchorage to threaded hanger bolt.
 - .2 For concrete and solid masonry anchorage, use drilled-in expansion shield and either concealed hanger bolt or exposed lag bolt, as applicable.
 - .3 For hollow masonry anchorage, fasten brackets directly on masonry wall using toggle bolts.
 - .4 For steel framed gypsum board assemblies, fasten brackets to wood blocking using lag bolts or to metal blocking using self-tapping screws, of size and type required to support structural loads.

- .5 Hand items over for casting into concrete or building into masonry to appropriate trades together with setting templates.
- .6 Touch up shop primer to bolts, welds, and burned or scratched surfaces at completion of erection.

3.4 CLEANING

- .1 Perform cleaning as soon as possible after installation to remove construction and accumulated environmental dirt.
- .2 Remove protective coverings and clean metal work using cleaning solutions and methods to suit the metal and its finish at completion of work.
- .3 Protect adjacent materials and finishes from damage or discolouring during cleaning.
- .4 Upon completion of installation, remove surplus materials, rubbish, tools and equipment barriers.

3.5 PROTECTION

- .1 Protect installed products and components from damage during construction.

END OF SECTION

Part 1 General

1.1 SUMMARY

- .1 This Section includes:
 - .1 Rooftop equipment bases and support curbs.
 - .2 Wood blocking, cants, wall backing, and nailers.
 - .3 Wood furring and grounds.
 - .4 Sheathing.
 - .5 Plywood backing panels.
- .2 Related Requirements:
 - .1 Section 06 40 00 – Architectural Woodwork
 - .2 Section 07 27 19 – Sheet Membrane Air and Vapour Barrier
 - .3 Section 07 52 00 – Modified Bituminous Membrane Roofing
 - .4 Section 07 62 00 – Sheet Metal Flashing and Trim
 - .5 Section 07 92 00 – Sealants
 - .6 Section 09 91 00 – Painting
 - .7 Section 10 28 10 – Toilet and Bath Accessories

1.3 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Submit product data in accordance with Section 01 33 00 – Submittal Procedures:
 - .1 Submit manufacturer's printed product literature, specifications and data sheets.
 - .2 Submit SDS sheets or official manufacturer literature stating no urea-formaldehyde was used in the manufacturing of composite wood.
- .2 Product Data:
 - .1 Include data for wood-preservative treatment from chemical treatment manufacturer and certification by treating plant that treated materials comply with requirements. Indicate type of preservative used and net amount of preservative retained.
- .3 Submit samples in accordance with Section 01 33 00 – Submittal Procedures.
 - .1 Submit 100 mm x 300 mm samples of cedar to receive finish, to the Consultant for review.
- .4 Material Certificates:
 - .1 For dimensional lumber specified to comply with minimum allowable unit stresses, indicate species, grade, and design values for each use.

- .2 For exposed items, omit grade stamp and provide certificates as to species, grade, stress grade, seasoning, moisture content, and other evidence as required to show compliance with the specifications.
- .5 Site Quality Control Submittals: Prior to covering exterior sheathing and shear walls, request structural engineer to review nailing patterns and provide confirmation report to Consultant.
- .6 LEED Submittals: provide LEED submittals in accordance with Section 01 61 01 - LEED Product Requirements.

1.4 QUALITY ASSURANCE

- .1 Lumber shall be graded and stamped by an agency certified by Canadian Lumber Standards Accreditation Board.
- .2 Plywood, particleboard, OSB and wood based composite panels in accordance with CSA and ANSI standards.

1.5 DELIVERY, STORAGE, AND HANDLING

- .1 Deliver wood products bundled or crated to provide adequate protection during transit. Inspect wood products for damage upon delivery and remove and replace damaged materials.
- .2 Store materials a minimum of 150 mm off the ground on blocking. Keep materials under cover and dry. Provide for air circulation within and around stacks and under temporary coverings.
- .3 Protect sheet materials to prevent breaking of corners and damage to surfaces.
- .4 Packaging Waste Management
 - .1 Separate waste materials for reuse and recycling in accordance with Section 01 74 19 – Construction Waste Management.

Part 2 Products

2.1 MATERIALS

- .1 Materials of this section are to be Forest Stewardship Council or SFI graded wood.

2.2 PANEL MATERIALS

- .1 Sheathing
 - .1 Fire Rated Plywood Panels to CSA O325, FSC Certified, Class A fire retardant produced under Performance Standard PS-1, certified by the American Plywood Association.
 - .1 Basis-of-Design Materials:
 - .1 Purekor Fire Retardant Plywood.
 - .2 Plywood panels to CSA O325, thickness as indicated on drawings.
 - .3 Interior sheathing shall be ULC labelled fire resistant, provide grade stamp or certification as noted for fire retardant pressure treated lumber.

- .2 Pressure Preservative Treated Plywood:
 - .1 Plywood Grade: exterior grade sheathing.
 - .2 Treatment: In accordance with CAN/CSA O80 Series.
 - .3 Product: amine copper quat (ACQ) or copper Azole (CA).
 - .4 Retention:
 - .1 Above ground application: minimum of 4.0 kg/m³.
 - .2 Ground Contact Application: minimum of 6.4 kg/m³
 - .5 Water-borne preservative treated wood shall have maximum moisture content of 19% after treatment.

2.3 CEDAR

- .1 Cedar: Western Red Cedar graded to meet NLGA Grading Standards, paragraph 200 and WRCLA.
 - .1 Grade: A clear and better (NLGA paragraph 200b).
 - .2 Size (Nominal): 51 x 76 mm
 - .3 Pattern: S4S Square Edges
 - .4 Moisture Content: kiln dried
 - .5 Exposed surfaces: smooth face
 - .6 Finish: Water repellent, fungus and mildew resistant, resistant to ultraviolet (UV) light and as follows:
 - .1 Miniwax 350 VOC Helmsman, Satin Spar Urethane.
- .2 Moisture Content: kiln dried to less than 15% moisture content, confirm moisture content and provide testing results to Consultant prior to application.

2.4 MISCELLANEOUS LUMBER

- .1 Provide lumber for support or attachment of other construction, including furring, strapping, blocking, nailing strips, ground, rough bucks, cants, curbs, fascia, backing sleepers, and similar members.
- .2 Select and cut lumber to eliminate knots and other defects that will interfere with attachment of other work for blocking and nailers.
- .3 Fabricate miscellaneous lumber from dimension lumber of sizes indicated, and into shapes shown on drawings.
- .4 Moisture Content: 19% maximum for lumber items not specified to receive wood preservative treatment.
- .5 Grade: for dimension lumber sizes provide No. 2 or Standard grade lumber per NLGA. For board-sized lumber, provide sheathing grade, S2S.
- .6 Kiln dry lumber materials to 8% moisture content or less.

2.5 WOOD PRESERVATIVE

- .1 Where lumber or plywood is indicated as preservative treated or is specified to be treated, treated in accordance with CAN/CSA O80.9M and AWWA.
- .2 Wood preservatives containing arsenic or chromium are not permitted.

- .3 Pressure treat above ground items with waterborne preservatives to minimum retention of 4.0 kg/m³. After treatment, kiln-dry lumber and plywood to maximum moisture content of 19% and 15% respectively. Treat indicated items and the following:
 - .1 Wood cants, nailing strips, curbs, equipment support bases, blocking, stripping, and similar members in connection with roofing, flashing, vapour barriers, and waterproofing.
 - .2 Wood sills, sleepers, blocking, furring, stripping, and similar concealed members in contact with masonry and concrete.
 - .3 Wood framing members less than 460 mm above grade.
 - .4 Wood floor plates installed over concrete slabs directly in contact with earth.
- .4 Pressure treat wood members in contact with ground or freshwater with waterborne preservatives to minimum of 6.4kg/m³
- .5 Fire-Retardant Treatment: to CAN/CSA O80.9M, CAN/CSA O80.20M and CAN/CSA O80.27M, pressure impregnated, and as follows:
 - .1 Flame Spread Classification: FSC 25 maximum.
 - .2 Smoke developed of not more than: 75.
- .6 Complete fabrication of treated items before treatment where possible. If cut after treatment apply field treatment to cut surfaces.
- .7 Wood Preservatives: Maximum allowable VOC limit 350 g/L in accordance with SCAQMD Rule #1113 - Architectural Coatings.

2.6 FASTENERS

- .1 Provide fasteners of size and type indicated that comply with requirements specified in this article for material and manufacture. Where rough carpentry is exposed to weather (during or after construction), in ground contact, pressure preservative treated, or in area of high relative humidity, provide fasteners with hot dip zinc coating complying with ASTM A153 or of Type 304 stainless steel.
- .2 Nails, spikes and staples: to CSA B111, hot dipped galvanized for exterior work and pressure preservative and fire retardant treated materials. Provide stainless steel fasteners to ASTM F1667, No. 316 for cedar lumber.
- .3 Power Driven Fasteners: Fasteners with a CCMC or ICC-ES evaluation report acceptable to authorities having jurisdiction.
- .4 Nailing discs: flat caps, minimum 25 mm diameter, minimum 0.4 mm thick, sheet metal or fibre, formed to prevent dishing. Bell or cup shapes not acceptable.
- .5 Through Bolts and Anchor Bolts: ASTM A307, Grade A; with ASTM A563 hex nuts and where indicated flat washers, hot dip galvanized to ASTM A153.
- .6 Wood Screws: ASME B18.6.1 or as specified on Drawings.
- .7 Lag Screws: ASME B18.2.1
 - .1 All lag screws to be machined threaded, not cast threaded.
 - .2 Pre-drilled hole sized in wood members for lag screws to be in accordance with CSA O86.

- .3 Lag screws are acceptable only where specifically indicated on the Drawings. Do not substitute lag screws for self-tapping wood screws.

2.7 FASTENER FINISHES

- .1 Galvanizing: to CSA-G164, use galvanized fasteners for exterior work, interior highly humid areas, pressure-preservative, and fire-retardant treated lumber.

2.8 ACCESSORIES

- .1 Sealants: in accordance with Section 07 92 00 – Sealants.
 - .1 Maximum allowable VOC limit 250 g/L in accordance with SCAQMD Rule 1168.
- .2 General purpose adhesive: to CSA O112 Series.
 - .1 Maximum allowable VOC limit 70 g/L in accordance with SCAQMD Rule 1168.
- .3 Surface Applied Wood Preservative:
 - .1 Containing minimum 19.6% Disodium octaborate tetrahydrate and 1.0% dodecyl dimethyl ammonium chloride in propylene glycol and water in accordance with CAN/CSA-O80.
 - .2 Apply minimum of two coats applied in accordance with manufacturers written instructions.
 - .3 Basis-of-Design Materials:
 - .1 Boracol 20-2BD, Sasco Products Ltd.
- .4 Insulating strip: rubberized, moisture resistant, 3 mm thick cork or closed cell neoprene strip, 12 mm wide, with self sticking permanent adhesive on one face, lengths as required.
- .5 Rough Hardware (bolts, nuts, washers, etc.): Hot dip galvanized in conformity to CSA G164 or Grade A low carbon steel, conforming to ASTM A307.
- .6 Proprietary fasteners: toggle bolts, expansion shields and lag bolts, screws and lead or inorganic fibre plugs, explosive actuated fastening devices, recommended for purpose by manufacturer.
- .7 Expanding foam sealant:
 - .1 Acceptable Materials:
 - .1 GREAT STUFF PRO™, Dow Canada
 - .2 Hilti (Canada) Ltd. CF Filler Foams.
 - .3 Froth Pak, DuPont

Part 3 Execution

3.1 INSTALLATION

- .1 Comply with requirements of Building Code supplemented by following paragraphs.
- .2 Install members true to line, levels and elevations, square and plumb.

- .3 Construct continuous members from pieces of longest practical length.
- .4 Do not splice structural members between supports unless noted otherwise.
- .5 Install spanning members with "crown-edge" up.
- .6 Select exposed framing for appearance. Install lumber and panel materials so that grade-marks and other defacing marks are concealed or are removed by sanding where materials are left exposed.
- .7 Install blocking at locations indicated to support washroom accessories.
- .8 Install wall sheathing in accordance with manufacturer's printed instructions.
- .9 Install blocking, plates and backing for all components mounted on gypsum board walls, ceilings, and bulkheads requiring support.
 - .1 Components include, but not limited to: architectural woodworking components, door frames and hardware, windows, displays, lockers, handrails, mirrors, white boards and tack boards, washroom partitions and accessories, boot racks, curtains, interior signage, window treatments, manufactured specialties, mechanical and electrical devices, and items indicated as N.I.C. and requiring support.
 - .2 Center supporting members on fastening line of supported component.
 - .3 Supporting members to extend one stud spacing to each side of the supported component.
- .10 Install furring to support siding applied vertically where there is no blocking and where sheathing is not suitable for direct nailing.
 - .1 Align and plumb faces of furring and blocking to tolerance of 1:600.
- .11 Install rough bucks, nailers and linings to rough openings as required to provide backing for frames and other work.
- .12 Install wood cants, fascia backing, nailers, curbs and other wood supports as required and secure using galvanized steel fasteners.
- .13 Install sleepers as indicated.
- .14 Use dust collectors and high quality respirator masks when cutting or sanding wood panels.
- .15 Sort and select lumber so that natural characteristics do not interfere with installation or with fastening other materials to lumber. Do not use materials with defects that interfere with function of member or pieces that are too small to use with minimum number of joints or optimum joint arrangement.
- .16 Comply with AWPA M4 and revisions specified in CSA O80 Series, supplementary requirements to AWPA M2 for applying field treatment to cut surfaces of preservative-treated lumber.

3.2 POWER, TELECOMMUNICATIONS AND DATA PANEL BOARDS

- .1 Install 19 mm fire rated fir plywood boards on all walls in telephone and data rooms receiving wiring and equipment; minimum 1220 mm x 2440 mm panels on periphery walls over 300 mm wide, mounted 150 mm off of finished floor.

3.3 ERECTION

- .1 Frame, anchor, fasten, tie and brace members to provide necessary strength and rigidity.
- .2 Countersink bolts where necessary to provide clearance for other work.
- .3 Use nailing disks for soft sheathing as recommended by sheathing manufacturer.

END OF SECTION

Part 1 General

1.1 SUMMARY

- .1 This Section Includes:
 - .1 Shop manufactured architectural woodwork in accordance with Architectural Woodwork Standards (NAAWS).
 - .2 Cabinet hardware.
- .2 Related Requirements:
 - .1 Section 05 50 00 – Metal Fabrications
 - .2 Section 06 10 00 – Rough Carpentry
 - .3 Section 07 92 00 – Sealants
 - .4 Section 09 21 16 – Gypsum Board Assemblies
 - .5 Section 09 65 00 – Resilient Flooring
 - .6 Section 09 91 00 – Painting
 - .7 Section 09 99 99 – Material List
 - .8 Section 10 28 10 – Toilet and Bath Accessories
 - .9 Division 22 – Plumbing and Drainage Sections
 - .10 Division 26 – Electrical
 - .11 Division 27 – Communications
 - .12 Division 28 – Electronic Safety and Security

- .2 Definitions:
 - .1 Exposed Surfaces of Casework: Surfaces visible when doors and drawers are closed, including visible surfaces in open cabinets or behind glass doors, and interior faces of doors and drawer fronts, bottom of upper cabinets when 1220 mm or more above finished floor, sides of all modular components regardless of their position in the assembled casework, and any surface visible from above.
 - .2 Semi-exposed Surfaces of Casework: Surfaces behind opaque doors or drawer fronts, including interiors and sides of drawers and bottoms of wall mounted casework, horizontal surface of toe set back.
 - .3 Concealed Surfaces of Casework: Surfaces not usually visible after installation, including sleepers, web frames, dust panels, bottoms of drawers, and ends of cabinets installed directly against and completely concealed by walls or other cabinets; tops of wall cabinets and utility cabinets.

1.3 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Submit shop drawings in accordance with Section 01 33 00 – Submittal Procedures.
 - .1 Show location of each item, dimensioned plans and elevations, large scale details, attachment devices, and other components.
 - .2 Show details of construction, profiles, jointing, fastening and other related details.
 - .3 Provide seaming diagram for solid surface finishes.
 - .4 Show materials, thicknesses, finishes and hardware.
 - .5 Show locations and sizes of cut-outs and holes for plumbing fixtures and other items installed in architectural woodwork.
- .2 Submit samples in accordance with Section 01 33 00 – Submittal Procedures.
 - .1 Submit two finished samples, 610 mm x 610 mm of each finish to be applied at the factory, to the Consultant for approval. Where materials are being matched, verify that specified materials match existing prior to submitting samples.
 - .2 Alternative cabinet hardware from that specified shall be submitted to the Consultant for approval.
 - .3 Reviewed samples shall become the standard for the work.
- .3 LEED Submittals: provide LEED submittals in accordance with Section 01 61 01 - LEED Product Requirements.

1.4 CLOSEOUT SUBMITTALS

- .1 Project Record Sheet: Submit to the Consultant two copies of the project record sheet identifying the project title and address, Owner, Consultant, and Architectural Woodwork Subcontractor. Indicate materials and finishes used for architectural woodwork and whether shop finished, or site finished and by whom. Include type and source of all cabinet hardware and any special items used under architectural woodwork.
- .2 Submit in accordance with Section 01 78 00 – Closeout Submittals.

1.5 QUALITY ASSURANCE

- .1 Architectural Woodwork Standards (NAAWS) and Errata shall be used to establish the minimum level of quality for this project.
- .1 Wood used as part of this work shall be FSC (Forest Stewardship Council) certified or SFI certified.
- .2 Execute the work of this Section by a member of AWMAC with five years' experience in work of comparable complexity and scope.
- .3 Any reference to Custom or Premium grade in this specification shall be as defined in the NAAWS.
- .4 Any item not given a specific quality grade shall be Custom grade as defined in the NAAWS.

- .5 A copy of the NAAWS shall be made readily available for reference purposes on the job site.
- .6 References in this specification to part and item numbers mean those parts and items contained within the NAAWS.
- .7 Perform the Work in accordance with the definition of 'Good Workmanship' as defined in the NAAWS.
- .8 Remove and replace finish carpentry Work which does not conform to the NAAWS.
- .9 Guarantee and Inspection Service (GIS)
 - .1 Architectural woodwork shall be manufactured and/or installed to the current AWMAC Architectural Woodwork Standards and shall be subject to an inspection at the factory and/or site by an appointed AWMAC Certified Inspector. Inspection costs shall be included in the tender price for this project. (Contact your local AWMAC Chapter for details of inspection costs). Shop drawings shall be submitted to the AWMAC Chapter office for review before work commences. Work that does not meet the AWMAC Architectural Woodwork Standards, as specified, shall be replaced, reworked and/or refinished by the architectural woodwork contractor, to the approval of AWMAC, at no additional cost to the owner.
 - .2 If the woodwork contractor is an AWMAC Manufacturer member in good standing, a two year AWMAC Guarantee Certificate will be issued. The AWMAC Guarantee shall cover replacing, reworking and/or refinishing deficient architectural woodwork due to faulty workmanship or defective materials supplied and/or installed by the woodwork contractor, which may appear during a two year period following the date of issuance.
 - .3 If the woodwork contractor is not an AWMAC Manufacturer member they shall provide the owner with a two year maintenance bond, in lieu of the AWMAC Guarantee Certificate, to the full value of the architectural woodwork contract.
 - .4 For more information about AWMAC and the GIS Program visit the AWMAC website at www.awmac.com and contact the Ontario AWMAC Chapter office.
- .10 Materials and installation shall be in metric measurements.

1.6 DELIVERY, STORAGE, AND HANDLING

- .1 Deliver, store, and handle materials in accordance with the NAAWS. Control the temperature and humidity in accordance with NAAWS recommendations, before, during, and after delivery, during storage, and during and after installation as required.
- .2 Provide protective coverings of suitable material for plastic laminate items, taking special precautions to protect corners.
- .3 Do not permit delivery of millwork to the site until the area is sufficiently dry so that woodwork shall not be damaged by excessive changes in ambient humidity.
- .4 Packaging Waste Management

- .1 Separate waste materials for recycling in accordance with Section 01 74 19 – Construction Waste Management.

1.7 SITE CONDITIONS

- .1 Comply with the NAAWS requirements for care and storage for optimum temperature and humidity conditions. Maintain a minimum 430 lx (40 f.c.) illumination on surfaces and areas where work is being installed.
- .2 Where work is indicated to be fitted to other construction, check dimensions of other construction by field measurement before fabrication; show recorded field measurements on final Shop Drawings. Coordinate fabrication schedule with construction schedule and progress to avoid delay of Work.
- .3 Where field measurements cannot be made without delaying the Work, guarantee dimensions and proceed with fabrication without field measurements. Coordinate other construction to ensure that actual dimensions correspond to guaranteed dimensions.

1.8 WARRANTY

- .1 Provide manufacturer's standard ten year warranty for solid surfacing against defects in materials and workmanship; including material and labour to repair or replace defective materials.
- .2 Provide two year AWMAC GIS Guarantee or Maintenance Bond.

Part 2 Products

2.1 MATERIALS

- .1 Materials of this section are to be Forest Stewardship Council or SFI graded wood.
- .2 Basis-of-Design Materials: Materials and colours listed below form the Basis-of-Design materials for this project.
- .3 Materials other than named products Basis-of-Design materials may be acceptable to the Consultant; submit information in accordance with Section 01 62 00 – Product Options and Substitutions no later than seven days prior to bid closing date and as follows:
 - .1 Proposed alternates shall match colour range, texture and performance characteristics of named products, and shall not require a change to colour board for Project.
 - .2 Proposed alternates found acceptable by Consultant will be listed in an Addendum.
 - .3 The Consultant is not obliged to accept any materials presented for their review and does not need to provide reasons for rejection of proposed alternates.
- .4 Use clean stock only and comply with NAAWS for quality grades specified.
- .5 Furring, Blocking, Shims, and Hanging Strips: Fire retardant treated softwood, Softwood or hardwood lumber, kiln dried to less than 8% moisture content.

- .6 Panel Materials: Provide panel materials meeting requirements for moisture content and grades in accordance with NAAWS requirements and as specified below. Panel products must be manufactured with no added urea-formaldehyde.
- .7 Douglas fir sheathing, Grade B-B; exposure durability rating shall be 'EXTERIOR', and the glue used shall be a fully waterproof structural adhesive
- .8 European Multi-Ply Plywood: Grade B/BB, urea-formaldehyde free.
- .9 Poplar plywood: to CSA O153, utility interior moisture resistant type.
- .10 Medium Density Fibreboard (MDF): Meeting ASTM D1037 and ANSI A208.2, Premium Grade for interior use, minimum 700 kg/m³ density; formaldehyde emissions shall be 0.30 ppm or less per 0.424m²/m³ of room value.
 - .1 Forestry Stewardship Council (FSC) certified.
 - .2 Urea-formaldehyde free.
 - .3 Acceptable Materials for high moisture areas (e.g., bathrooms):
 - .1 Medex MDF, Roseburg.
 - .2 Flakeboard Premier Plus Moisture Resistant MDF, Flakeboard.
 - .4 Acceptable Materials for standard applications:
 - .1 Medite II MDF, Roseburg.
 - .2 Flakeboard Premier MDF, Flakeboard.
 - .5 Basis-of-Design Materials for thin paper laminates and thermally fused melamine:
 - .1 Flakeboard Premier Plus MDF, Flakeboard.
 - .6 Acceptable Materials for fire resistant core:
 - .1 Medite MDF FR, Roseburg.
 - .2 Flakeboard Premier MDF FR, Flakeboard.
- .11 Particleboard: to ANSI A208.1, Grade M-2 or better, minimum 720 kg/m³ density and Grade M-3, minimum 750 kg/m³ particleboard for countertops and shelves; clearly mark panels with grade mark in visible location; extruded particleboard having loose cores with voids will not be permitted; having no added urea formaldehyde.
 - .1 Acceptable Materials:
 - .1 Vesta Particleboard, Arauco.
 - .2 Purekor Platinum Particleboard, Panel Source International.
 - .3 Encore SDF Sustainable Particleboard, SierraPine Ltd.
- .12 Lumber:
 - .1 Softwood: to CSA O141, kiln dried to maximum moisture content of 12%, dressed 4 sides.
- .13 High Pressure Decorative Laminate (HPDL): to IST 4586-2 and ANSI/NEMA LD3; Grades and application in accordance with applicable NAAWS requirements and as follows:
 - .1 Constructed of multiple layers of phenolic resin-saturated kraft paper in combination with a layer of decorative melamine-saturated paper, all fused together under heat and pressure.

- .2 Horizontal General Purpose Grade (HGS): thickness of 1.2 mm \pm 0.12 mm, used on the following:
 - .1 Horizontal surfaces, unless specified otherwise.
- .3 Vertical General Purpose Grade (VGS): thickness of 0.7 mm \pm 0.10 mm, used on the following:
 - .1 Vertical surfaces, unless specified otherwise.
 - .2 Exposed portions of case bodies, including ends, divisions and bottoms.
 - .3 Exposed shelves.
 - .4 Casework Doors: exposed and semi-exposed surfaces.
 - .5 Drawer Faces: exposed and semi-exposed surfaces.
- .4 Liner Grade (CLS): thickness of 0.5 mm \pm 0.10 mm, used on the following:
 - .1 Semi-exposed shelves.
 - .2 Interior portions of case bodies.
 - .3 All surfaces of drawer boxes.
- .5 Laminate backer grade (BKL): thickness of 0.5 mm \pm 0.10 mm, used on the following:
 - .1 Concealed surface of casework backs.
 - .2 Concealed surfaces, unless specified otherwise.
- .6 Colour Basis-of-Design: As indicated in Section 09 99 99 – Material List
- .7 Acceptable Materials:
 - .1 Arborite.
 - .2 Formica.
 - .3 Lamin-Art.
 - .4 Nevamar.
 - .5 Pionite.
 - .6 Wilsonart.
- .14 Low Pressure Decorative Laminate: to ANSI/NEMA LD3, in accordance with applicable NAAWS requirements, and as follows:
 - .1 Melamine impregnated papers thermally fused under pressure.
 - .2 Thickness: 0.5 mm minimum.
 - .3 Wear Resistance: 400 cycles minimum.
 - .4 Colours: white or as indicated on Drawings.
- .15 Solid-Surfacing Material: Cast, nonporous, filled polymer, with through body colour meeting requirements of ANSI/NEMA LD 3, and having the following nominal properties:
 - .1 Thickness: as indicated on drawings.
 - .2 Surface Burning Characteristics: in accordance with CAN/ULC S102 and as follows:
 - .1 Flame Spread: Maximum 25.
 - .2 Smoke Developed: Maximum 25.

- .3 Food Zone Use: Pass Rating in accordance with NSF 51 Sanitation requirements.
- .4 Colour Basis-of-Design: As indicated in Section 09 99 99 – Material List
- .5 Acceptable Materials:
 - .1 Avonite, Avonite, Inc.
 - .2 Corian, Dupont Polymers.
 - .3 Everform, Formica Corporation.
 - .4 Wilsonart Solid Surface, Wilsonart International.
- .16 Edging:
 - .1 Edge type shall conform to NAAWS requirements.
 - .2 Solid, high impact, purified, colour-thru, acid resistant, PVC edging.
 - .1 3 mm edging at counter tops, drawers, doors, and splashes.
 - .2 1 mm edging at cabinet boxes, exposed shelving, and concealed shelving.
 - .3 All edges of door and drawer panels shall be finished the same as face and back (6 sides finished).
- .17 Adhesive:
 - .1 Decorative laminate: polyvinyl acetate or aliphatic resin in accordance with manufacturer's recommendation for curing under pressure for bonding to wood cores, water resistant type.
 - .2 Edge banding: Thermoplastic hot melt, synthetic resin suitable for applying thin veneer wood edge banding and film overlays.
 - .3 Solid surface adhesive: as recommended by manufacturer.
- .18 Sealant: in accordance with Section 07 92 00 – Sealants.

2.2 CABINET WORK

- .1 Work shall conform to applicable NAAWS requirements.
- .2 Apply edge banding to all four edges.
- .3 Door and Drawer Bumpers: Self-adhesive type approximately 6 mm diameter clear silicone bumpers for all cabinet work doors and drawer faces, two per door and drawer, placed at door top and bottom and drawer top.

2.3 CABINET FABRICATION

- .1 General
 - .1 Flush overlay cabinet doors and drawer fronts as detailed.
 - .2 Fabricate gables and edges meeting walls oversize to allow for scribing to fit on site.
 - .3 Use non-telegraphing grain plywood when laminate is the specified finish.
 - .4 Assemble Work with flush butt hairline corners and joints. Cut-outs for services to be done on site during installation. No hairline cracks will be allowed in the face area of cabinet work modules unless approved in writing by Consultant.

- .5 Carefully fit, cope or mitre and well glue-up Joints. There shall be no end wood visible on finished surfaces.
- .6 Set nail heads in finished surfaces. Countersink screws and bolts, except those detailed to be exposed, and fill holes with edge grain wood plugs to match colour and grain.
- .7 Ensure adjacent part of continuous work match in colour and pattern.
- .2 Construction
 - .1 Minimum core thicknesses as follows:
 - .1 Drawer bottoms, particleboard, 12 mm;
 - .2 Drawer sides and backs, particleboard, 12 mm;
 - .3 Drawer fronts, MDF, 19 mm;
 - .4 Doors, MDF, 19 mm;
 - .5 Lower case backs against walls, particleboard, 10 mm;
 - .6 Upper case backs against walls, particleboard, 10 mm;
 - .7 Shelves, fixed and adjustable, plywood, 19 mm;
 - .8 Counter top cores, Plywood with non-telegraphing grain, 19 mm with 38 mm edge, for wet areas, use plywood with type two adhesive and ensure that all cut-outs are sealed prior to installation of sinks, primer is not considered to be an appropriate sealer;
 - .9 Backsplashes at all locations: Poplar Veneer Plywood, 19 mm; use plywood with type two adhesive at wet areas,
 - .10 All other work Poplar Veneer Plywood, 19 mm.
 - .2 Glue, dowel, mortise, lock joint or dado all cabinet work and cabinet work. Do not use staples. Nailing and screws are acceptable. Do not surface nail or screw through countertops.
 - .3 Blocking, framing, web frames to be solid lumber.
 - .4 Cut and adapt all Work to receive hardware.
 - .1 Drill and prepare end gables for insert type shelf standards on gables.
 - .2 Install all finishing hardware and fittings in shop.
 - .3 Fittings which may be susceptible to damage during shipping and installation may be installed after millwork installed on site.

2.4 CABINET HARDWARE

- .1 Provide the following cabinet hardware, in quantity required, complete with all screws, bolts, washers for complete installation.
- .2 Non-Exposed Fasteners: fabricators choice consistent with quality level specified.
- .3 Exposed Fasteners: Architectural appearance, material, finish and fastener tool type as selected by Consultant; coordinate sample submittals before ordering materials.
- .4 Draw Bolt Fasteners: Mitre butt joint fastener, adjustable and requiring no special tools for installation, galvanized.

- .1 Acceptable Materials:
 - .1 Häfele Canada Inc.
 - .2 K&V 516, Knappe & Vogt Canada.
 - .3 BP5162G, Richelieu
- .5 Spacers: Rigid PVC to size and profile indicated.
- .6 Access Panel Connectors
 - .1 Basis-of-Design Materials:
 - .1 Type JCBA0101C2 complete with Tee-Nut 26112, Richelieu.
- .7 Furniture Levellers and Guides: Richelieu 9 mm Ø screw type glide 34 mm long x 28 mm pad Ø.
- .8 Pulls: Typical drawers and doors.
 - .1 Wire Pulls: chromed 4 mm thick stainless steel wire pulls with nominal 162 mm centres:
 - .1 Acceptable Materials:
 - .1 CBH.
 - .2 Häfele Canada Inc.
 - .3 BP10746140, Richelieu.
 - .4 Stanley.
- .9 Drawer Slides: Following list of drawer slides is provided to indicate general conformance requirements only; notify the Consultant where drawer width, height or intended use differs from that indicated in the general description and the requirements of the manufacturer:
 - .1 Light duty drawer slides: 34 kg capacity, ¾ extension and soft closers:
 - .1 Acceptable Materials:
 - .1 2132, Accuride.
 - .2 3611, Dynaslide.
 - .3 KA3432, Hettich Canada LP.
 - .4 8350, Knappe and Vogt.
 - .2 Medium duty drawer slides and high height drawers (≥150 mm, ≤305 mm): 41 kg capacity, full extension and soft closers:
 - .1 Acceptable Materials:
 - .1 3834, Accuride.
 - .2 Dynapro, Grass.
 - .3 KA5632, Hettich Canada LP.
 - .4 8400, Knappe & Vogt.
- .10 Hinges:
 - .1 Typical Cabinet Doors: Concealed, euro-style hinge with cover caps; fully adjustable for overlay, depth, height and closing force; opening angle of 110°; self-closing feature; nickel plated steel construction; overlay and half overlay mounting, and soft closers, size and profile to suit cabinet construction:

- .1 Acceptable Materials:
 - .1 CLIP top Series, Blum Canada Ltd.
 - .2 Tiomos, GRASS Canada.
 - .3 Salice 700 Series, Häfele Canada Inc.
 - .4 Sensys, Hettich Canada LP.
- .11 Shelf Rests:
 - .1 Stainless steel pin rests: 7 mm Ø socket collar inserts for steel pin shelf supports, drill holes in cabinet work to accept collar, chrome or nickel finish:
 - .1 Acceptable Materials:
 - .1 Series 331/325 grommet, Knappe & Vogt Canada.
 - .2 5829-180/2292-180, Richelieu.
- .12 Miscellaneous Items:
 - .1 Smoker's Pole: fire-safe, weather resistant powder coated aluminum.
 - .1 Basis-of-Design Material:
 - .1 H-2458BL, Rubbermaid, Uline.ca

2.5 FACTORY FINISHING – CABINET WORK

- .1 Cabinet work for High Pressure Decorative Laminate Finish:
 - .1 NAAWS Quality Grade Custom.
 - .2 Construction: Cabinet work shall conform to applicable sections of the NAAWS.
 - .3 Exposed Parts and interior of cabinet doors: High pressure decorative laminate, substrate as indicated.
 - .4 Semi-Exposed Parts: Low pressure decorative laminate, substrate as specified above.
 - .5 Concealed parts: Low pressure decorative laminate backer to balance face materials.
 - .6 Backprime concealed surfaces after installation as follows:
 - .1 Surfaces in contact with concrete, masonry, floors or floor finishes.
 - .2 Underside of window stools.
 - .3 Underside of front edges of countertops and toe-spaces.
 - .4 Other surfaces that may be subjected to moisture during use or cleaning.

Part 3 Execution

3.1 EXAMINATION

- .1 Site Conditions for installation of architectural woodwork shall be in accordance with applicable NAAWS requirements.

- .2 Verify condition and dimensions of previously installed work upon which this Section depends. Report defects to Consultant. Commencement of Work means acceptance of existing conditions.

3.2 PREPARATION

- .1 Obtain measurements from site.
- .2 Check access to ensure large pieces of work can be safely handled to their place of final installation.
- .3 Verify that solid blocking for support and anchoring of woodwork is installed where required. Confirm exact height and location with Drawings and Consultant.
- .4 Protect finished surfaces and materials of other trades from damage.
- .5 Ensure services and roughing-in which affect or are connected to or through this work are complete and acceptable.
- .6 Back prime cabinet work immediately after delivery to site.

3.3 INSTALLATION

- .1 Install work to applicable NAAWS and Quality Assurance requirements.
- .2 Install cabinet work in its indicated locations, plumb, level, and true.
- .3 Anchor to floor, walls, blocking, or ceiling using fastening devices and hardware consistent with the building materials encountered. Do not use wood plugs. Do not use plastic plugs for ceilings or walls. Provide wall strapping as required.
- .4 Anchor cabinet work and millwork to building structure. Shim level and set square in relation to adjoining surfaces. Scribe to adjacent Work. Provide allowance for finish flooring installation to base.
- .5 Cabinet work:
 - .1 Fasten to framing using zinc-coated bolts, countersunk and plugged with matching wood plugs.
 - .2 Set cabinetwork in place, on base, anchoring securely to building structure and to adjoining cabinetwork. Use approved connector type fasteners between items of cabinetwork to hold adjoining pieces tightly together.
 - .3 Scribe to smooth snug fit with adjoining surfaces and materials to align work. Mitre corners.
 - .4 Perform cutting, fitting, repairing in woodwork as required by other trades where their work is connected to or part of this work.
 - .5 Cut out openings for mechanical, electrical, and communications fittings and fixtures. Coordinate and cooperate in the connection and installation of mechanical, electrical, and communications work.
 - .6 Apply sealant between countertops and adjoining walls and cabinetwork. Seal edges of cut-out core material before fixtures installed.
 - .7 Install finishing hardware shipped loose.

- .6 Supply and install hardware required for the completion of architectural woodwork, including, without limitations, adjustable shelf supports and cabinet hinges, catches, pulls, drawer accessories, bumpers, drawer slides and closet hanger bars, and similar items. Install millwork hardware in the shop wherever possible. Install millwork hardware secure, plumb, level, true to line, and in accordance with the hardware manufacturers' printed instructions. Cut and fit to millwork for proper installation and operation. Provide smoothly operating units free from binding. Clean and adjust hardware for proper operation.

3.4 INSTALLATION, SOLID SURFACING

- .1 Install extra support as required for size and weight of solid surfacing in accordance with AWMAC recommendations.
- .2 Install components plumb and level, in accordance with shop drawings and manufacturers written installation requirements.
- .3 Form joints and seams between solid polymer components using manufacturer's approved seam adhesive. Joints shall be inconspicuous in appearance and without voids to create a monolithic appearance.
- .4 Rout and finish component edges to a smooth, uniform appearance and finish. Edge shapes and treatments, including any inserts, shall be as detailed on the drawings. Rout all cutouts, then sand all edges smooth. Repair or reject defective or inaccurate work.
- .5 Adhere sinks to countertops using manufacturer's recommended adhesive and mounting hardware.
- .6 Install backsplashes and end splashes as indicated on Drawings; adhere to countertops using manufacturer's standard colour matched silicone sealant.
- .7 Coordinate plumbing connections and electrical requirements with affected Sections of work.

3.5 ADJUSTING

- .1 During and after installation adjust all hardware and operating parts as necessary to ensure smooth and proper operation.

3.6 CLEANING

- .1 Clean all cabinet, countertops, shelves and fixtures.
- .2 Repair any marks, scratches or marring.
- .3 Remove and replace damaged, marked, or stained architectural woodwork.

END OF SECTION

Part 1 General

1.1 SUMMARY

- .1 Section includes sanitary fibre reinforced wall panels including trims, adhesive, sealant and fastenings.
- .2 Related Requirements
 - .1 Section 06 10 00 - Rough Carpentry
 - .2 Section 09 21 16 - Gypsum Board Assemblies

1.2 REFERENCES

- .1 Reference Standards:
 - .1 American Society for Testing and Materials International (ASTM):
 - .1 ASTM E84-23d, Standard Test Method for Surface Burning Characteristics of Building Materials.
 - .2 Canada Green Building Council (CaGBC):
 - .1 LEED Canada V4 – Building Design and Construction (BD+C).

1.3 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Product Data.
 - .1 Submit manufacturer's printed product literature, specifications and data sheet in accordance with Section 01 33 00 - Submittal Procedures.
 - .2 Submit two copies of **Workplace Hazardous Materials Information System** WHMIS SDS - Safety Data Sheets in accordance with Section 01 33 00 - Submittal Procedures. Indicate VOC's:
 - .1 For caulking materials during application and curing.
 - .2 For adhesives.
- .2 Shop Drawings.
 - .1 Submit shop drawings in accordance with Section 01 33 00 - Submittal Procedures.
 - .2 Indicate, by large scale details, materials, finishes, dimensions, anchorage and assembly.
- .3 Samples.
 - .1 Submit samples in accordance with Section 01 33 00 - Submittal Procedures.
 - .2 Submit duplicate 300 mm long samples of profiles and colours for corner and door frame.
- .4 Manufacturer's Instructions.
 - .1 Submit manufacturer's installation instructions.
- .5 LEED Submittals: provide LEED submittals in accordance with Section 01 61 01 – LEED Product Requirements.

1.4 QUALITY ASSURANCE

- .1 Pre-Installation Meetings: conduct pre-installation meeting to verify project requirements, manufacturer's installation instructions and manufacturer's warranty requirements.
- .2 Test Reports: certified test reports showing compliance with specified performance characteristics and physical properties.
- .3 Certificates: product certificates signed by manufacturer certifying materials comply with specified performance characteristics and criteria and physical requirements.

1.5 DELIVERY, STORAGE, AND HANDLING

- .1 Packaging Waste Management
 - .1 Separate and recycle waste materials in accordance with Section 01 74 19 – Construction Waste Management.

Part 2 Products

2.1 MATERIALS

- .1 Wall Panels:
 - .1 Type: fibre reinforced panel to USDA/FSIS and Canadian Food Inspection Agency (CFIA) and Agriculture Canada approved.
 - .2 Dimensions: 1.9 mm thick x 1220 mm x 2440 mm.
 - .3 Texture: smooth.
 - .4 Fire Rating: Class I/A to ASTM E84.
 - .5 Colour: as directed by Consultant from manufacturers standard range.
 - .6 Acceptable Materials:
 - .1 Glasbord, Crane Composites.
 - .2 Graham, Exceliner/glasliner panels.
 - .3 Marlite FRP Wall Panels.
 - .4 Panolam Surface Systems
 - .5 Sequentia, Thermo Design.

2.2 ACCESSORIES

- .1 Adhesive: water resistant type as recommended by manufacturer for substrate.
- .2 Sealant: Manufacturer's recommended silicone sealant; colour matched to panels.
- .3 Fastenings: Nylon drive rivets or stainless steel screws as recommended by manufacturer.

Part 3 Execution

3.1 INSTALLATION

- .1 Compliance: comply with manufacturer's written data, including product technical bulletins, product catalogue installation instructions, product carton installation instructions, and data sheets.
- .2 Install panels in accordance with manufacturer's written instructions; maintain a reference copy of installation instructions on site for review by installers and the Consultant.
- .3 Position panels leaving a minimum 6 mm gap at ceiling and floor junction; minimum 3 mm gap between each panel and division bar moulding to allow for normal expansion and contraction; minimum 3 mm gap around pipes, electrical fittings, other projections; and pre-drill oversize by 3 mm holes ready for fastenings.
- .4 Cut and drill panels using a carbide tipped saw blade or drill bit; or cut with snips as recommended by manufacturer.
- .5 Pre-fit each panel before securing in place; leave leading edge of first panel unfastened; trim division bar to accommodate ceiling cove or base moulding:
 - .1 Apply bead of silicone sealant on one side of division bar and install on leading edge of first panel.
 - .2 Push division bar all the way onto panel and pull back to form a minimum 3 mm gap; confirm plumb; tack division bar using fasteners recommended by manufacturer.
 - .3 Fasten leading edge of first panel.
- .6 Install fasteners at nominal 400 mm o.c. both horizontally and vertically. Maintain edge fasteners 25 mm from panel edge face.
- .7 Stagger fasteners on opposing panel edges and corners next to a division bar to aid in maintaining tight, flat seam.
- .8 Use combination of mechanical fasteners and adhesive to ensure flat surface, using compatible adhesives recommended by panel manufacturer prior:
 - .1 Fasten panel at top and work toward bottom or start at centre and work outward.
 - .2 After installation of first panel is completed remove excess sealant immediately.
 - .3 Apply bead of sealant in remaining channel of division bar.
 - .4 Install second panel into division bar.
 - .5 Pull panel back to leave a minimum 3 mm clearance.
 - .6 Check plumb.
 - .7 Remove excess sealant.
 - .8 Fasten second panel except for leading edge.
 - .9 Repeat previous steps until all panels are installed.
- .9 Remove excess silicone sealant during installation.

- .10 Seal corner seams, ceiling, and base junctions; install accessories as installation progresses, leaving a minimum 3 mm clearance for normal expansion and contraction of panels.
- .11 Cut trims neatly, use only full length except where joins are permitted by Consultant; tightly mitre trims at right angle corners; tightly cut trims at Tee junctions to maintain flush straight fit.

3.2 CLEANING

- .1 Perform cleaning after installation to remove construction and accumulated environmental dirt.
- .2 Clean surfaces after installation using manufacturer's recommended cleaning procedures.
- .3 Upon completion of installation, remove surplus materials, rubbish, tools and equipment barriers.

END OF SECTION

Part 1 General

1.1 SUMMARY

- .1 Section Includes: Blower Door Test Procedures
 - .1 Provide blower door testing to confirm building envelope meets specified requirements for air infiltration.
 - .2 Tests required: (A) Mid-envelope c/w air barrier in place (B) Final installation.
- .2 Related Requirements:
 - .1 Section 07 42 43 – Insulated Metal Panels
 - .2 Section 07 72 33 – Roof Hatches
 - .3 Section 08 11 13 – Steel Doors and Frames
 - .4 Section 08 11 16 – Aluminum Doors and Frames
 - .5 Section 08 44 13 – Glazed Aluminum Curtain Walls

1.2 REFERENCES

- .1 Acronyms:
 - .1 TEDI: Thermal Energy Demand Intensity (TEDI) (kWh/m²/yr).
 - .2 TEUI: Total Energy Use Intensity (TEUI) (kWh/m²/yr).
 - .3 ERLN: Envelope Air Leakage Rate (EALR_{n75}) (l/s/m²).
 - .4 IPAL: Interior Partitions Air Leakage Rate (IPALR_{n50}) (l/s/m²).
 - .5 PRL: Peak Thermal Load (PTL) (W/m²).
 - .6 MEUI: Mechanical Energy Use Intensity (MEUI) (kWh/m²/yr).
- .2 Reference Standards:

 - .2 ASTM E779-19, Standard Test Method for Determining Air Leakage Rate by Fan Pressurization.
 - .3 ASTM E1186-22, Standard Practices for Air Leakage Site Detection in Building Envelopes and Air Barrier Systems
 - .4 ASTM E1258-88(2018), Standard Test Method for Airflow Calibration of Fan Pressurization Devices.
 - .5 ASTM E1827-22, Standard Test Methods for Determining Airtightness of Buildings Using an Orifice Blower Door.
 - .2 Canada Green Building Council (CaGBC):
 - .1 LEED Canada V4 – Building Design and Construction (BD+C).

1.3 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Submit in accordance with the requirements of 01 33 00 Submittal Procedures.
 - .1 Shop Drawings: Indicate location of blower door set up.

- .2 Equipment: Submit make and model of equipment proposed for test procedures.
- .3 Test Methodology: Submit proposed test methodology, and revise and resubmit where required by Consultant.
- .4 Reports: Submit test reports within two working days of test completion to Owner and Consultant.
- .5 The report shall contain at least the following information:
 - .1 Building description, including, location, address (street, city, province, postal code, country, and elevation above mean sea level in m.
 - .2 Construction, including date built (estimate if unknown), floor areas for conditioned space, attic, basement, and crawl space, and volumes (optional) for conditioned spaces attic, basement, and crawl space:
 - .3 Condition of openings in building envelope including:
 - .4 Doors, closed, locked or unlocked;
 - .5 Windows, closed, latched or unlatched;
 - .6 Ventilation openings, dampers closed or open;
 - .7 Statement whether the test zone is interconnected with at least door-sized openings. If not, the results of pressure measurements between portions of the zone.
 - .8 HVAC system, including the location and sizes of ducts that penetrate the test zone envelope.
 - .9 Procedure, including the test equipment used (manufacturer, model, serial number), and calibration records of all measuring equipment.
 - .10 Measurement data, including:
 - .1 Fan pressurization measurements (inside-outside zero flow building pressure differences);
 - .2 Inside and outside temperature (at start and end of test) and the product of the absolute value of the indoor/outdoor air temperature difference multiplied by the building height;
 - .3 Tabular list of all air leakage measurements and calculations: time, building pressure difference, air density, nominal airflow rate, fan airflow rate, and air leakage rate; and, deviations from standard procedure.
 - .4 Optional data, including wind speed/direction and whether wind speed is estimated to exceed 0 to 2 m/s.
 - .11 Calculations, including:
 - .1 The leakage coefficient and pressure exponent for both pressurization and de- pressurization,
 - .2 The effective leakage area. Report if a reference pressure other than 4 Pa is used; and an estimate of the confidence limits.

1.4 SITE CONDITIONS

- .1 Provide adequate power and lighting to execute testing.
- .2 Provide testing as required by Consultant and York Region requirements and at times as required by York Region requirements. Provide testing in zones and with interior finishes as required.

Part 2 PRODUCTS

2.1 MATERIALS

- .1 Provide materials as required to measure testing including framing, door, sealants and air barrier materials.

2.2 EQUIPMENT

- .1 Air-Moving Equipment: A fan, blower, or blower door assembly that is capable of moving air into and out of the conditioned space at required flow rates under a range of test pressure differences.
- .2 Pressure-Measuring Device: A manometer or pressure indicator to measure pressure difference with an accuracy of 65% of measured pressure.
- .3 Airflow Measuring System: A device to measure airflow with an accuracy of 65 % of the measured flow. The airflow measuring system shall be calibrated in accordance with Test Method ASTM E1258.
- .4 Temperature-Measuring Device: An instrument to measure temperature with accuracy of $\pm 1^{\circ}\text{C}$.

Part 3 EXECUTION

3.1 VERIFICATION OF CONDITIONS

- .1 Prepare test area for testing.
- .2 Verify doors and frames are correct size.
- .3 Installation of doors and frames: Refer to Section 08 11 13 - Steel Doors and Frames, Section 08 11 16 - Aluminum Doors and Frames, and Section 08 44 13 - Glazed Aluminum Curtain Walls.

3.2 APPARATUS

- .1 Install blower as recommended by the blower manufacturer.

3.3 SITE QUALITY CONTROL

- .1 Test Methodology: This test is a multi point test. Use more than one location across the building envelope for pressure measurement, for example, one across each façade
- .2 Verify this condition by differential pressure measurements at the highest pressure used in the test. Make these measurements at the highest and lowest level of the building and on the windward and leeward sides

- .3 To perform the test according to ASTM E779 the range of induced pressure difference shall be from 10Pa to 60Pa.
- .4 Avoid locations such as exterior corners and complex architectural features. Select locations close to the middle of the exterior wall.
- .5 Average the pressures from each location using a manifold. Average the pressures over at least a 10 second time period.
- .6 Do not adjust HVAC balancing dampers and registers and close other operable dampers unless they are used to pass air to pressurize, or to de-pressurize the building.
- .7 Make general observations of the condition of the building. Take notes on the windows, doors, opaque walls, roof, and floor.
- .8 Measure and record the indoor and outdoor temperatures at the beginning and the end of the test so that their average values can be estimated.
- .9 Connect the air duct or blower door assembly to the building envelope, using a window, door, or vent opening. Seal or tape openings to avoid leakage at these locations.

END OF SECTION

Part 1 General

1.1 SUMMARY

- .1 Section Includes:
 - .1 Waterproofing Membrane: single-component, polymer-modified, cold-applied, water based liquid waterproofing membrane.
 - .2 Primer.
 - .3 Reinforcing Sheet.
 - .4 Flashing and Transition Membrane.
 - .5 Joint Sealant.
 - .6 Adhesive.
 - .7 Below Grade Insulation.
 - .8 Drainage board.
 - .9 Drainage board accessories.
- .2 Related Requirements:
 - .1 Section 03 30 00 – Cast-in-Place Concrete
 - .2 Section 06 10 00 – Rough Carpentry
 - .3 Section 07 21 13 – Board Insulation
 - .4 Section 07 27 13 – Modified Bituminous Air and Vapour Barrier
 - .5 Section 07 92 00 – Sealants

1.2 REFERENCES

- .1 Reference Standards:
 - .1 American Society for Testing and Materials International (ASTM):
 - .1 ASTM C836/C836M-18(2022), Standard Specification for High Solids Content, Cold Liquid-Applied Elastomeric Waterproofing Membrane for Use with Separate Wearing Course.
 - .2 ASTM C1325-22e1 Standard Specification for Fiber-Mat Reinforced Cementitious Backer Units.
 - .3 ASTM D146/D146M-04 (2020), Standard Test Methods for Sampling and Testing Bitumen-Saturated Felts and Woven Fabrics for Roofing and Waterproofing.
 - .4 ASTM D412-16(2021), Standard Test Methods for Vulcanized Rubber and Thermoplastic Elastomers-Tension.
 - .5 ASTM D4716/D4716M-22, Standard Test Method for Determining the (In-plane) Flow Rate per Unit Width and Hydraulic Transmissivity of a Geosynthetic Using a Constant Head
 - .6 ASTM E96/E96M-23, Standard Test Methods for Gravimetric Determination of Water Vapor Transmission Rate of Materials.
 - .2 Canada Green Building Council (CaGBC):
 - .1 LEED Canada V4.1 – Building Design and Construction (BD+C), Interior Design + Construction (ID+C).

1.3 ADMINISTRATIVE REQUIREMENTS

- .1 Convene pre-installation meeting one week prior to beginning waterproofing Work, with waterproofing contractor's representative, Engineer, Consultant, and Contractor in accordance with Section 01 31 19 – Project Meetings to:
 - .1 Verify project requirements.
 - .2 Review installation and substrate conditions.
 - .3 Co-ordination with other building subtrades.
 - .4 Review manufacturer's installation instructions and warranty requirements.

1.4 ACTION SUBMITTALS /INFORMATIONAL SUBMITTALS

- .1 Submit product data in accordance with Section 01 33 00 – Submittal Procedures:
 - .1 Submit manufacturer's printed product literature, specifications and data sheet.
 - .2 Provide one electronic copy of most recent data sheets describing materials' physical properties and include product characteristics, performance criteria, physical size, finish and limitations.
 - .3 Provide one electronic copy of WHMIS SDS - Safety Data Sheets in accordance with WHMIS acceptable to Labour Canada, and Health and Welfare Canada and indicate VOC content.
- .2 Manufacturer's Installation Instructions: submit manufacturers recommended installation instructions and procedures.
- .3 LEED Submittals: provide LEED submittals in accordance with Section 01 61 01 - LEED Product Requirements.

1.5 QUALITY ASSURANCE

- .1 Installer qualifications: Use a qualified installer who is authorized, approved, or licensed by waterproofing manufacturer to install manufacturer's products, who has a minimum of five years of experience with installations of similar complexity and scope.
- .2 Obtain primary waterproofing materials from single manufacturer and/or ensure materials ordered and supplied are compatible with one another.
- .3 Compatibility between components of waterproofing system is essential. Provide written declaration to Consultant stating that materials and components, as assembled in system, meet this requirement.
- .4 Mock-ups
 - .1 Provide required Sample Installation in accordance with Section 01 45 00 – Quality Control.
 - .2 Apply waterproofing to 10 m² area of wall to demonstrate surface preparation, crack and joint treatment, corner treatment, thickness, texture, and execution quality.
 - .3 When accepted, mock-up will demonstrate minimum standard of quality required for this Work. Approved mock-up may remain as part of finished Work.

1.6 DELIVERY, STORAGE, AND HANDLING

- .1 Deliver materials to site in manufacturer's original, unopened containers and packaging with labels clearly identifying product name and manufacturer.
- .2 Store materials in a clean, dry area in accordance with manufacturer's instructions.
- .3 Store adhesives, primers and membrane materials at temperatures of 5° C and above to facilitate handling.
- .4 Do not store at temperatures above 32° C for extended periods.
- .5 Protect materials during handling and application to prevent damage or contamination.
- .6 Packaging Waste Management
 - .1 Separate and recycle waste materials in accordance with Section 01 74 19 – Construction Waste Management.

1.7 SITE CONDITIONS

- .1 Apply waterproofing within the range of ambient and substrate temperatures recommended by waterproofing manufacturer.
- .2 Apply waterproofing to dry substrates, when relative humidity is less than 85%, and when surface and ambient temperatures are 3°C above dew point.
- .3 Do not apply waterproofing in snow, rain, fog or mist, or when such weather conditions are imminent during application and curing period.
- .4 Maintain adequate ventilation during application and curing of waterproofing materials.

1.8 WARRANTY

- .1 Submit written warranty, signed by waterproofing manufacturer agreeing to repair or replace waterproofing that does not comply with requirements or that does not remain watertight for a period of two years from Substantial Performance, and as follows:
 - .1 Warranty is inclusive of all failures except for failures resulting from failure of substrate prepared and treated in accordance with requirements or formation of new joints and cracks in substrate exceeding 1.5 mm in width.
 - .2 Warranty is inclusive for procedures to gain access to waterproofing membrane including removal and reinstallation of earthwork, protection board, drainage panels, and insulation.

Part 2 Products

2.1 MANUFACTURERS

- .1 Acceptable manufacturers: Subject to compliance with requirements of this Section, products by the following manufacturers are acceptable. However, it is Contractor's responsibility to provide only products compatible with adjacent materials in assembly.

- .1 Epro Services, Inc.
- .2 Henry Company.
- .3 Tremco Commercial Sealants and Waterproofing.
- .4 W.R. Meadows Inc.

2.2 MATERIALS

- .1 Waterproofing Membrane: single-component, polymer-modified, cold-applied, water based liquid waterproofing membrane able to develop bond to substrate under conditions of service and application indicated and with the following properties:
 - .1 Solids by volume: 60% minimum.
 - .2 Film thickness: 120 mils wet, 60 mils dry.
 - .3 Total cure time: 16 – 24 hours.
 - .4 Elongation: minimum 600 % to ASTM D412.
 - .5 Water vapour transmission: 0.03 perms to ASTM E96, B.
 - .6 Acceptable Materials:
 - .1 Aqua-Bloc 720-38, Henry Company.
 - .2 Mel-Rol LM or Mel-Rol LM All Season, W.R. Meadows
 - .3 Tremproof 260, Tremco Commercial Sealants and Waterproofing.

2.3 ACCESSORIES

- .1 Primer: Manufacturer's standard, factory-formulated polyurethane or epoxy primer.
- .2 Reinforcing Sheet: fibreglass mesh or polyester fabric material designed for and compatible with membrane bitumen as required by waterproofing membrane manufacturer.
- .3 Flashing and Transition Membrane: Nominal 1.5 mm, manufacturer's standard non-staining premanufactured elastomeric membrane and adhesive.
- .4 Joint Sealant: Multi-component polyurethane sealant, compatible with waterproofing; and as recommended by manufacturer for substrate and joint conditions.
- .5 Adhesive for overlay board and insulation: Water-based rubberised liquid coating as recommended by manufacturer.
- .6 Below Grade Insulation: as indicated in Section 07 21 13 - Board Insulation.
- .7 Drainage board: high-strength drainage panel consisting of polypropylene core and fabric for installation over waterproof membranes with the following characteristics:
 - .1 Thickness: 10 mm
 - .2 Compressive strength: minimum 718 kPa to ASTM D1621
 - .3 Flow rate: 196 l/min/m to ASTM D4716.
 - .4 Acceptable Materials:
 - .1 DB 6000, Henry Company
 - .2 TremDrain 6000, Tremco

.3 Mel-Drain 5035, W.R. Meadows

- .8 Provide drainage board accessories as required for complete installation as recommended by drainage board manufacturer. Ensure drainage board is compatible with waterproofing.

Part 3 Execution

3.1 EXAMINATION

- .1 Do not proceed with work until conditions are in accordance with manufacturers instructions.
- .2 Ensure surfaces are smooth, dry, clean and free of ice and debris as per manufacturer's recommendations.
- .3 Verify the compatibility of membrane components with curing compounds, coatings, or other materials which are already installed on the surfaces to be treated.

3.2 PREPARATION OF SURFACES

- .1 Mask off adjoining surfaces not receiving waterproofing to protect other materials from spillage or overspray.
- .2 Ensure concrete is smooth and free from voids and honeycombing prior to application of waterproofing membrane. Where voids, cracks, holes and other damages to surfaces exist, repair prior to application of waterproofing membrane.

3.3 PREPARATION AT TERMINATIONS AND PENETRATIONS

- .1 Prepare vertical and horizontal surfaces at terminations and penetrations through waterproofing and at expansion joints, drains, and sleeves in accordance with manufacturer's written instructions.
- .2 Prime substrate in accordance with waterproofing manufacturer's written instructions.
- .3 Apply double thickness of waterproofing and embed joint reinforcing strip in preparation coat.
- .4 Provide sealant cants around penetrations and at inside corners of deck-to-wall butt joints.

3.4 PREPARATION AT JOINTS AND CRACKS

- .1 Prepare, treat, rout, and fill joints and cracks in substrate in accordance with manufacturer's written instructions.
- .2 Remove dust and dirt from joints and cracks before coating surfaces.
- .3 Apply bond breaker between sealant and preparation strip.
- .4 Prime substrate and apply a single thickness of preparation strip extending minimum 75 mm along each side of joint.
- .5 Apply double thickness of waterproofing and embed joint reinforcing strip in preparation coat.

- .6 Install sheet flashing and bond to deck and wall substrates where indicated or as required by waterproofing manufacturer's written instructions; extend sheet flashings onto perpendicular surfaces and other work penetrating substrate.

3.5 WATERPROOFING MEMBRANE INSTALLATION

- .1 Apply waterproofing in accordance manufacturer's written instructions after concrete has cured to acceptable moisture levels and vapour emissions, and not less than seven-14 days after concrete forms are removed as recommended by membrane manufacturer.
- .2 Apply primer over prepared substrate in accordance with manufacturer's written instructions.
- .3 Mix materials and apply waterproofing by spray, roller, notched squeegee, trowel, or other application method suitable to spatial orientation of substrate.
- .4 Apply membrane in sufficient coats to obtain seamless installation free from trapped gasses or air pockets to an average dry film thickness of 1.5 mm, with no less than 1.3 mm dry film thickness at any point of the installation.
- .5 Verify wet film thickness of waterproofing every 10 m2.
- .6 Protect waterproofing from damage and wear during remainder of construction period.
- .7 Correct deficiencies in or remove waterproofing that does not comply with requirements; repair substrates, reapply waterproofing, and repair sheet flashings.

3.6 DRAINAGE BOARD INSTALLATION

- .1 Allow waterproofing to completely cure prior to applying drainage board.
- .2 Install drainage material in accordance with manufacturers written instructions.
- .3 Protect installed drainage panels from damage due to UV light, harmful weather exposures, physical abuse, and other causes. Provide temporary coverings where insulation is subject to abuse and cannot be concealed and protected by permanent construction immediately after installation.

END OF SECTION

Part 1 General

1.1 SUMMARY

.1 Section Includes:

- .1 Foundation Wall Insulation.
- .2 Load Bearing Insulation.
- .3 Semi-Rigid Mineral Wall Insulation.
- .4 Accessories.

.2 Related Requirements:

- .1 Section 03 30 00 – Cast-in-Place Concrete
- .2 Section 04 22 00 – Unit Masonry
- .3 Section 06 10 00 – Rough Carpentry
- .4 Section 07 21 19 – Foam-in-Place Insulation
- .5 Section 07 27 13 – Modified Bituminous Air and Vapour Barrier
- .6 Section 07 27 19 – Sheet Membrane Air and Vapour Barrier
- .7 Section 07 52 00 – Modified Bituminous Membrane Roofing
- .8 Section 07 62 00 – Sheet Metal Flashing and Trim
- .9 Section 08 44 13 – Glazed Aluminum Curtain Walls
- .10 Section 09 21 16 – Gypsum Board Assemblies

 - .8 ULC 770, Standard Test Method for Determination of Long-term Thermal Resistance of Closed-Cell Thermal Insulating Foams. (CAN/ULC S770-15).

1.3 ADMINISTRATIVE REQUIREMENTS

- .1 Pre-Installation Meetings: convene pre-installation meeting one week prior to beginning work of this Section and on-site installation, with contractor's representative and Consultant in accordance with Section 01 31 19 – Project Meetings to:
 - .1 Verify project requirements.
 - .2 Review installation and substrate conditions.
 - .3 Co-ordination with other building subtrades.
 - .4 Review manufacturer's installation instructions.

1.4 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Submit product data in accordance with Section 01 33 00 – Submittal Procedures:
 - .1 Submit manufacturer's printed product literature, specifications and data sheet.
 - .2 Provide data on product characteristics, performance criteria, and limitations.
 - .3 Published "R" value for thicknesses of insulation for each product indicated.
 - .4 Product test reports and Research/ evaluation reports.
 - .5 Submit manufacturer's literature including installation instructions, independent test data confirming compliance with reference standards, attachment, and specification requirements."
 - .6 Refer to Sections 07 42 13 - Preformed Metal Cladding for thermal performance modeling and engineering requirements.
 - .7 Provide one electronic copy of Workplace Hazardous Materials Information System WHMIS SDS - Safety Data Sheets in accordance with WHMIS acceptable to Labour Canada, and Health and Welfare Canada. Indicate VOC's insulation products and adhesives.
- .2 Manufacturer's Instructions:
 - .1 Submit manufacturer's installation instructions.
 - .2 Note R-value requirements for exterior assemblies. Provide thermal modeling reports to confirm clear field r-value for proprietary systems.
- .3 LEED Submittals: provide LEED submittals in accordance with Section 01 61 01 - LEED Product Requirements.

1.5 QUALITY ASSURANCE

- .1 Test Reports: certified test reports showing compliance with specified performance characteristics and physical properties.
- .2 Certificates: product certificates signed by manufacturer certifying materials comply with specified performance characteristics and criteria and physical requirements.
- .3 Health and Safety Requirements: in accordance with Section 01 35 29 - Health and Safety Requirements.

- .4 Thermal Conductivity: The thicknesses shown are for the thermal conductivity specified for each material. Provide adjusted thicknesses as directed for the use of material having a different thermal conductivity.
- .5 Fire and Insurance Ratings: Comply with fire-resistance flammability and insurance ratings, where required, and comply with Code interpretations by Authorities Having Jurisdiction.
- .6 Mock-Up:
 - .1 Refer to Section 01 45 00 – Quality Control for mock-up.
 - .2 Mock-up to include through wall flashing detail, window interface, and board insulation attachment.
 - .3 Cooperate with mock-up of exterior wall as described in specification and drawings, including accessories to Consultant's satisfaction.
 - .4 Locate where directed by Consultant.
 - .5 Accepted mock-up may remain as part of the Work

1.6 DELIVERY, STORAGE, AND HANDLING

- .1 Storage and Handling Requirements:
 - .1 Protect insulation materials from physical damage and from deterioration by moisture, soiling, and other sources. Store inside and in a dry location. Comply with manufacturer's written instructions for handling, storing, and protecting during installation.
 - .2 Protect plastic insulation as follows:
 - .1 Do not expose to sunlight, except to extent necessary for period of installation and concealment.
 - .2 Protect against ignition at all times. Do not deliver plastic insulating materials to Project site before installation time.
 - .3 Complete installation and concealment of plastic materials as rapidly as possible in each area of construction.
- .2 Packaging Waste Management
 - .1 Separate and recycle waste materials in accordance with Section 01 74 19 – Construction Waste Management.

Part 2 Products

2.1 INSULATION MATERIALS

- .1 Foundation Wall Insulation: Extruded polystyrene (XPS) to CAN/ULC 701 and as follows:
 - .1 Type: IV.
 - .2 Thermal Resistance: LTTR RSI 0.88/25 mm minimum.
 - .3 Edges: square.
 - .4 Size: 610 mm x 2440 mm x thickness as indicated on Drawings.
 - .5 Compressive Strength: minimum 200 kPa at 10% deformation in accordance with ASTM D1621.

- .6 Water Absorption: maximum 0.7% (% by volume) in conformance with ASTM D2842.
- .7 Acceptable Materials:
 - .1 Styrofoam SM, DuPont Performance Building Solutions.
 - .2 Foamular C-300, Owens-Corning Canada LP.
 - .3 Sopra-XPS 30, Soprema.
- .2 Load Bearing Insulation: Extruded Polystyrene (XPS) or expanded polystyrene (EPS), high density extruded type in accordance with CAN/ULC 701 and CAN/ULC 770 and as follows:
 - .1 Type: IV
 - .2 Thermal Resistance: LTTR RSI 0.87/25 mm minimum.
 - .3 Edges: square.
 - .4 Size: 1220 mm x 2440 mm x thickness as indicated on Drawings.
 - .5 Compressive Strength: minimum 275 kPa at 5% deformation in accordance with ASTM D1621.
 - .6 Water Absorption: maximum 1% (% by volume) in conformance with ASTM D2842.
 - .7 Acceptable Materials:
 - .1 Styrofoam, Hiload 40, DuPont Performance Building Solutions.
 - .2 Foamular NGX 400, Owen-Corning Canada
 - .3 Sopra-XPS 40, Soprema.
- .3 Semi-Rigid Mineral Wall Insulation: Unfaced, preformed semi-rigid fibrous mineral slag board insulation in accordance with CAN/ULC 702 and as follows:
 - .1 Type: 1VB to ASTM C612.
 - .2 Thermal Resistance: RSI 0.74/25 mm minimum.
 - .3 Combustion Characteristics: non-combustible in accordance with CAN/ULC 114.
 - .4 Flame spread and Smoke Development:
 - .1 Flame spread: 0 in accordance with CAN/ULC 102.
 - .2 Smoke Development: 0 in accordance with CAN/ULC 102.
 - .5 Edges: square.
 - .6 Size: 406 mm x 1220 mm x thickness or as indicated on Drawings.
 - .7 Acceptable Materials:
 - .1 Cladstone, Johns Manville.
 - .2 Thermafiber Rain Barrier Mineral Wool Insulation, Owens Corning.
 - .3 CavityRock, Rockwool Inc.
- .4 Mineral Wool Rigid Insulation: Non-combustible, rigid, water repellent, mineral wool insulation board to ASTM C612, Type IVB and CAN/ULC 702 Type 1.
 - .1 Fire Performance:
 - .1 Non-combustibility: To CAN/ULC 114.
 - .2 Surface Burning Characteristics: To CAN/ULC 102.
 - .1 Flame spread: 0.

- .2 Smoke developed: 0.
- .2 Thermal Resistance: RSI 0.72/25 mm minimum and as indicated on Drawings.
- .3 Minimum Compressive Strength: 21 kPa @ 10% Compression.
- .4 Acceptable Materials:
 - .1 Thermafiber RainBarrier ci High Compressive Plus (80), Owens-Corning Canada LP
 - .2 ComfortBoard 80, Rockwool Inc.
- .5 Roof Insulation: Refer to Section – 07 52 00 – Modified Bituminous Membrane Roofing.
- .6 Curtain Wall Spandrel Insulation: Refer to Section 08 44 13 - Glazed Aluminum Curtain Walls, insulation types specific to curtain wall spandrels are specified as a part of curtain wall system requirements.

2.2 ACCESSORIES

- .1 Adhesive (for polystyrene): insulation manufacturers standard with trowel consistency, synthetic rubber based insulation adhesive compatible with polystyrene insulation to CGSB 71-GP-24; suitable for application in temperature down to -12°C.
- .2 Thermally Broken Clip System: Low-conductivity thermal spacers confirm all clips with structural engineer and loads in accordance with Section 01 35 00 – Delegated Design and as follows:
 - .1 Sub-framing Thermal Spacer: 100 % Pultruded glass fibre and thermoset polyester resin insulation clip.
 - .1 Thermal Spacer thickness for top, base and web: 4.8 mm nominal.
 - .2 Thermal Spacer Depth: as required by wind loads for Building location.
 - .3 Depth tolerance: ± 0.127 mm.
 - .4 Spacing: as indicated on Drawings or as required by delegated design.
 - .5 Fasteners: hot dipped galvanized type as recommended by manufacturer in length to suit wall construction.
 - .6 Shims: as required to remove imperfections in sheathing/stud wall.
 - .7 Basis-of-Design Materials:
 - .1 Cascadia Clip, Cascadia Windows Ltd.
 - .3 Girts: Fabricated from minimum 1.27 mm thickness galvanized steel to ASTM A653, Grade 230 with Z275 coating. Material visible after assembly of wall panel shall be finished to match aluminum panels.
 - .4 Sub-girts: Structural quality steel to ASTM A653, with Z275 zinc coating, adjustable double-angle profile as indicated to accept panel with structural attachment to building frame.
 - .5 Screw Fasteners: 316 Stainless steel, of type to suit installation and to support superimposed loads.
 - .6 Insulation Fasteners

- .1 Mechanical Fasteners: High quality, impact resistant plastic fastener system specifically designed for installation of board insulation materials; 38 mm diameter, shaft length to suit insulation thickness and hot dipped galvanized fastener to suit substrate, and as follows:
 - .1 Acceptable Materials:
 - .1 Insulation Fasteners, Ucan Fastening Systems.
 - .2 Ramset Insulfast.
 - .2 Insulation Clips: Impale type, perforated 50 mm x 50 mm cold rolled carbon steel 0.912 mm core metal thickness, adhesive back; 2.657 mm diameter annealed steel wire spindle, length to suit insulation, 25 mm diameter self locking washers, and as follows:
 - .1 Basis-of-Design Materials:
 - .1 Gemco Insulation Fasteners, Insulation Hanger.
- .7 Perimeter Insulation Flashings: Coordinate supply of end closures and flashings for perimeter insulation system with Section 07 62 00 - Sheet Metal Flashing and Trim.
- .8 Sheet steel: liner sheet, structural quality, grade A to ASTM A653, with Z275 zinc coating:
 - .1 Light duty modified silicone finish.
 - .2 Panel thickness: 24 gauge
 - .3 Colour: as directed by Consultant
 - .4 Panel Depth: 31 mm.
 - .5 Panel Width: 800 mm
 - .6 Fasteners: exposed with colour to match panel, spaced at locations as recommended by manufacturer.
 - .7 Basis of Design Materials:
 - .1 L800R Liner, VicWest

Part 3 Execution

3.1 EXAMINATION

- .1 Examine substrates and immediately inform Consultant in writing of defects.

3.2 PREPARATION

- .1 Prior to commencement of work ensure:
 - .1 Substrates are firm, straight, smooth, dry, free of snow, ice or frost, and clean of dust and debris.

3.3 INSTALLATION: GENERAL

- .1 Comply with manufacturer's written data, including product technical bulletins, product catalogue installation instructions, product carton installation instructions, and data sheets.
- .2 Install insulation after building substrate materials are dry.

- .3 Install insulation to maintain continuity of thermal protection to building elements and spaces.
- .4 Fit insulation tight (maximum 3 mm air gap) around electrical boxes, wires, plumbing and heating pipes and ducts, around exterior doors and windows and other protrusions.
- .5 Keep insulation minimum 75 mm from heat emitting devices such as recessed light fixtures, and minimum 50 mm from sidewalls of ULC 604 type A chimneys and CAN/CGA-B149.1 and CAN/CGA-B149.2 type B and L vents.
- .6 Use only insulation boards free from chipped or broken edges that is dry, and unsoiled and that has not been left exposed at any time to ice and snow.
- .7 Use largest possible dimensions to reduce number of joints.
- .8 Offset both vertical and horizontal joints in multiple layer applications.
- .9 Do not enclose insulation until it has been reviewed by Consultant.
- .10 Install rigid insulation to maintain continuous thermal insulation, vapour barrier and air tightness for building spaces and elements.
- .11 Saw-cut and trim insulation neatly to fit spaces. Butt edges and ends tight (maximum 3 mm air gap). Fit insulation tight against mechanical, electrical and other items protruding plane of insulation. Fill voids as recommended by manufacturer; refer to Section 07 21 19 - Foam-in-Place Insulation.
- .12 Follow the instructions for use of materials of insulation and accessory manufacturers.
- .13 Install insulation horizontally. Offset vertical joints minimum 300 mm and interlock corners.
- .14 Leave insulation joints unbonded over line of expansion and control joints; bond a continuous 150 mm wide strip of primary vapour membrane over expansion and control joints using compatible adhesive.

3.4 INSTALLATION: BELOW GRADE INSULATION

- .1 Rigid Fiber Insulation on Architectural Precast or Site Cast Concrete:
 - .1 Secure insulation by use of mechanical fasteners; impaling clips and pins.
 - .1 Locate fasteners from edges and at OC each direction.
 - .2 Lay out fasteners and install in mastic.
 - .3 Install washers and bend prongs of fasteners.
- .2 Install board insulation to vertical surfaces with adhesive applied in accordance with manufacturer's written instructions, and as follows:
 - .1 Interior Application: Extend boards as indicated on Drawings, installed on inside face of perimeter foundation walls.
 - .2 Exterior Application: Extend boards as indicated on Drawings.
 - .3 Apply adhesive to the substrate by the "dab" method not less than 10 mm x 20 mm size at 150 mm centres; bed the insulation in the adhesive before the adhesive loses its tack or skins over.

- .4 Protect below grade insulation on vertical surfaces from damage during backfilling by applying protection board; set in adhesive according to insulation manufacturer's written instructions.

3.5 INSTALLATION: UNDERSLAB INSULATION

- .1 Extend boards as indicated on Drawings, and as follows:
 - .1 Lay boards on level compacted fill.
 - .2 Protect top surface of horizontal insulation from damage during concrete work by applying protection board.
- .2 Load Bearing Insulation: Install in accordance with manufacturer's written instructions, and as follows:
 - .1 Load Bearing Insulation: Install board insulation horizontally having a minimum compressive strength as indicated above on level compacted fill to locations indicated on Drawings.
- .3 Tape joints of underslab insulation and fill with 2 lb spray insulation.

3.6 CLEANING

- .1 Upon completion of installation, remove surplus materials, rubbish, tools and equipment barriers.

3.7 PROTECTION

- .1 Protect installed board insulation from damage due to harmful weather exposures, physical abuse, and other causes.
- .2 Provide temporary coverings or enclosures where insulation is subject to abuse and cannot be concealed and protected by permanent construction immediately after installation

END OF SECTION

Part 1 General

1.1 SUMMARY

- .1 Section Includes:
 - .1 Foam-in-place insulation to exterior hollow steel door frames, aluminum door frames and window frames.
 - .2 Foam-in-place insulation around protrusions through the exterior wall envelope and juncture of different cladding materials.
- .2 Related Requirements:
 - .1 Section 07 21 13 – Board Insulation
 - .2 Section 07 27 13 – Modified Bituminous Air and Vapour Barrier
 - .3 Section 07 27 19 – Sheet Membrane Air and Vapour Barrier
 - .4 Section 07 92 00 – Sealants
 - .5 Section 08 11 13 – Steel Doors and Frames
 - .6 Section 08 11 16 – Aluminum Doors and Frames
 - .7 Section 08 44 13 – Glazed Aluminum Curtain Walls
 - .8 Section 08 50 13 – Aluminum Windows

- .5 ULC 770, Standard Test Method for Determination of Long-term Thermal Resistance of Closed-Cell Thermal Insulating Foams. (CAN/ULC S770-15).

1.3 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Submit product data in accordance with Section 01 33 00 – Submittal Procedures:
 - .1 Submit manufacturer's printed product literature, specifications and datasheet and include product characteristics, performance criteria, physical size, finish and limitations.
 - .2 Provide one electronic copy of Workplace Hazardous Materials Information System WHMIS SDS - Safety Data Sheets in accordance with WHMIS acceptable to Labour Canada, and Health and Welfare Canada.
- .2 Quality assurance submittals: submit following in accordance with Section 01 45 00 - Quality Control.
 - .1 Test reports: submit certified test reports for insulation from approved independent testing laboratories, indicating compliance with specifications for specified performance characteristics and physical properties.
 - .2 Submit test reports in accordance with CAN/ULC-101 for fire endurance and CAN/ULC-102 for surface burning characteristics.
 - .3 Manufacturer's Instructions: submit manufacturer's installation instructions and special handling criteria, installation sequence, and cleaning procedures.
- .3 LEED Submittals: provide LEED submittals in accordance with Section 01 61 00 - LEED Product Requirements

1.4 QUALITY ASSURANCE

- .1 Qualifications:
 - .1 Installers: Use companies that are members and licensed with CUFCA having trained and certified installers in accordance with ULC 705.2 and CUFCA requirements.
 - .2 Manufacturer: Obtain air and vapour seal materials from a single manufacturer regularly engaged in manufacturing the products specified in this Section.
- .2 Cooperate and coordinate with the requirements of other units of work specified in other sections.

1.5 DELIVERY, STORAGE, AND HANDLING

- .1 Packing, shipping, handling and unloading:
 - .1 Deliver, store and handle materials in accordance with Section 01 61 00 - Common Product Requirements.
 - .2 Deliver, store and handle materials in accordance with manufacturer's written instructions.
- .2 Packaging Waste Management
 - .1 Separate and recycle waste materials in accordance with Section 01 74 19 – Construction Waste Management.

1.6 SITE CONDITIONS

- .1 Apply insulation only when surfaces and ambient temperatures are within manufacturers' prescribed limits.
- .2 Ensure temperature is maintained throughout the curing period.
- .3 Provide sufficient ventilation during and until insulation has cured, to ensure safe working conditions. Introduce fresh air and exhaust air continuously during the 24 hour period after application.

1.7 WARRANTY

- .1 The work under this section shall be warranted by the contractor against defects in workmanship or material for a period of two years from date of Substantial Performance.

Part 2 Products

2.1 MATERIALS

- .1 Insulation: open cell, low expansion, one component, spray polyurethane foam.
 - .1 Water Infiltration: no leakage to ASTM E331.
 - .2 Sound Transmission Classification: 55 to ASTM E90.
 - .3 Tensile Strength: >5 N/cm² to HTC method 2106.
 - .4 RSI Value: minimum 0.88 m² K/W/25 mm to CAN/ULC 770.
 - .5 Acceptable Materials:
 - .1 EnerFoam, DuPont.
 - .2 HandiFoam Window & Door Sealant, Fomo Products Inc.
 - .3 CF 812 WD, Hilti (Canada) Ltd.
- .2 Thermal Barrier: spray applied fire retardant overcoat meeting applicable requirements of the Building Code for thermal barrier of foamed plastic.
 - .1 Gypsum/fibre based:
 - .1 Acceptable Materials:
 - .1 A/D Thermal Barrier, Carbolite (formerly AD Fire Protection Systems)
 - .2 CafcoBlaze-Shield II, Isolatek International.

- .3 Monokote Z-3306, WR Grace & Co.
- .2 Intumescent Coatings:
 - .1 Basis-of-Design Materials:
 - .1 DC315 Intumescent Coating, IFTI

Part 3 Execution

3.1 PREPARATION

- .1 Protect adjacent surfaces and equipment from damage by overspray, fall-out, and dusting of insulation materials.
- .2 Clean spaces that are to receive insulation, of dirt, dust, grease, loose material or other foreign matter that may inhibit adhesion.
- .3 Prior to application, slightly moisten surfaces to which foam-in-place insulation is being applied, to accelerate curing.
- .4 Temporarily brace frames as may be required to prevent possible bowing of frames due to over expansion of the foam-in-place insulation.

3.2 INSTALLATION/AIR SEAL AROUND EXTERIOR WINDOW AND DOOR FRAMES

- .1 Fill exterior hollow steel door frames 75% full with foam-in-place insulation prior to installation of frames. Fill the remainder of the frame after installation, through the gap between the frame and the wall construction.
- .2 Install foam-in-place insulation around all exterior window frames to maintain continuity of the thermal barrier, after air barrier has been installed and sealed to windows as specified.
- .3 Ensure that foam completely fills spaces, without voids, and that foam is continuous at corners.

3.3 INSTALLATION/AROUND PROTRUSIONS THROUGH AIR SEAL

- .1 Install foam-in-place insulation around all protrusions through the exterior building envelope to achieve and maintain continuity of air/vapour seal.
- .2 Insulate access hatches to the same R value as the assembly in which they occur to maintain continuous thermal protection.

3.4 CLEANING

- .1 Cut back excess foam-in-place insulation once cured, flush with surrounding surfaces, or recess back for application of sealant as specified in Section 07 92 00 - Sealants.
- .2 Upon completion of foam-in-place insulation work, clean adjacent surfaces of overspray and dusting to the satisfaction of the Consultant.

END OF SECTION

Part 1 General

1.1 SECTION INCLUDES

- .1 This section includes requirements for supply and installation of a spray polyurethane foam air and vapour seal system, and other components to bridge and seal the following air leakage pathways and gaps between; but not limited to, the following:
 - .1 Connections of the walls to the roof air seal.
 - .2 Connections of the walls to the foundations.
 - .3 Expansion joints.
 - .4 Openings and penetrations.
 - .5 Piping, conduit, duct and similar penetrations.
 - .6 All other air leakage pathways in the building envelope.
 - .7 A spray applied thermal barrier over the polyurethane.

1.2 RELATED REQUIREMENTS

- .1 Section 05 31 00 – Steel Deck
- .2 Section 06 10 00 – Rough Carpentry
- .3 Section 05 50 00 – Metal Fabrications
- .4 Section 07 27 13 – Modified Bituminous Air and Vapour Barrier
- .5 Section 07 62 00 – Sheet Metal Flashing and Trim
- .6 Section 07 92 00 – Sealants
- .7 Section 09 21 16 – Gypsum Board Assemblies

 - .8 ULC 718, Standard for Site Quality Assurance Program for Spray Polyurethane Foam (2018).
 - .9 ULC 770, Standard Test Method for Determination of Long-Term Thermal Resistance of Closed-Cell Thermal Insulating Foams (CAN/ULC-S770-15).
 - .10 ULC 774 - Standard Laboratory Guide for the Determination of Volatile Organic Compound Emissions from Polyurethane Foam. (CAN/ULC S774).

1.4 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Submit product data in accordance with Section 01 33 00 – Submittal Procedures:
 - .1 Submit manufacturer's printed product literature, specifications and datasheet and include product characteristics, performance criteria, physical size, finish and limitations.

- .2 Provide one electronic copy of WHMIS SDS - Safety Data Sheets in accordance with WHMIS acceptable to Labour Canada, and Health and Welfare Canada.
- .2 Quality assurance submittals: submit following in accordance with Section 01 45 00 - Quality Control.
 - .1 Test reports: submit certified test reports for insulation from approved independent testing laboratories, indicating compliance with specifications for specified performance characteristics and physical properties.
 - .2 Submit test reports in accordance with ULC-101 for fire endurance and ULC-102 for surface burning characteristics.
 - .3 Manufacturer's Instructions: submit manufacturer's installation instructions and special handling criteria, installation sequence, and cleaning procedures.
 - .4 Manufacturer's Field Reports: submit to manufacturer's written reports within three days of review, verifying compliance of Work, as described in PART THREE - FIELD QUALITY CONTROL.
- .3 Moisture content of wood: measure moisture content of wood that is to be in direct contact with insulation. Submit results to Consultant for review. Measure ten different locations and report on plans and details.

1.5 QUALITY ASSURANCE

- .1 Applicators to conform to Manufacturer's third party Site Quality Assurance Program.
- .2 Qualifications:
 - .1 Installer: person specializing in sprayed insulation installations with five years documented experience, approved by manufacturer.
 - .2 Manufacturer: company with minimum five years experience in producing of material used for work required for this project, with sufficient production capacity to produce and deliver required units without causing delay in work.
- .3 Health and Safety Requirements: Worker protection:
 - .1 Protect workers as recommended by ULC-705.2 and manufacturer's recommendations:
 - .2 Workers must wear gloves, respirators, dust masks, long sleeved clothing, eye protection, and protective clothing when applying foam insulation.
 - .3 Workers must not eat, drink or smoke while applying foam insulation.
- .4 Independent Testing Agency:
 - .1 Arrange for site reviews by Manufacturer's authorized agent. Schedule the number of site reviews in accordance with the following schedule:

Coverage Area, sq. m. (sq. ft.)	No. of Site Reviews
3,252 – 6,503 (35,000 – 70,000)	1
6,503 –9,755 (70,001 – 105,000)	2

9,755 – 13,006 (105,001 – 140,000)	3
over 13,006 (over 140,000)	4+

1.6 DELIVERY, STORAGE, AND HANDLING

- .1 Deliver, store and handle materials in accordance with Section 01 61 00 - Common Product Requirements.
- .2 Deliver, store and handle materials in accordance with manufacturer's written instructions.
- .3 Deliver materials in sealed unopened containers clearly indicating manufacturer, product identification and safety information.
- .4 Store materials above minimum temperature as recommended by manufacturer.
- .5 Store materials in dry and well-ventilated area away from weather and direct sunlight. Maintain temperatures between 18°C and 30°C.
- .6 Packaging Waste Management
 - .1 Separate and recycle waste materials in accordance with Section 01 74 19 – Construction Waste Management.

1.7 SITE CONDITIONS

- .1 Ventilate area to receive insulation by introducing fresh air and exhausting air continuously during and 24 hour after application to maintain non-toxic, unpolluted, safe working conditions.
- .2 Provide temporary enclosures to prevent spray and noxious vapours from contaminating air beyond application area.
- .3 Protect adjacent surfaces and equipment from damage by overspray, fall-out, and dusting of insulation materials.
- .4 Apply insulation only when surfaces and ambient temperatures are within manufacturer's prescribed limits.
- .5 Use of insulation products manufactured with HCFCs or CFCs as blowing agents is prohibited.
- .6 Plan and coordinate the insulation Work to minimize the generation of cut-offs and waste. Sequence Work to maximize use of insulation off-cuts and waste.

1.8 WARRANTY

- .1 The work under this section shall be warranted by the contractor against defects in workmanship or material for a period of two years from date of Substantial Performance.

Part 2 Products

2.1 MATERIALS

- .1 Acceptable Materials: Subject to compliance with requirements specified in this Section, manufacturers offering products that may be incorporated into the Work include; but are not limited to, the following:
 - .1 WallTite CM01, BASF.
 - .2 Heatlok Soya, Demilec Inc – Cornell Group.
 - .3 Insulthane Extreme, Elastochem
 - .4 JM Corbond III Canadian Formula, Johns Manville.
 - .5 Polarfoam PF-7300, Polyurethane Foam Systems Inc.
 - .6 BOREAL NATURE, Solutions Genyk Inc.
- .2 Insulation: spray polyurethane to CAN/ULC-S705.1, meeting requirements of Montreal Protocol for ozone protection without ozone depleting substances in blowing agents and as follows:
 - .1 Density to ASTM D1622: $\geq 28 \text{ Kg/m}^3$
 - .2 Thermal Resistance 180 days @ 23 deg C to ASTM C518.: 1.96 RSI/50 mm .
 - .3 Open Cell Content to ASTM D6226: $\leq 8\%$
 - .4 Water Vapour Permeance, 50 mm sample to ASTM E96: $\leq 60 \text{ ng/Pa.s.m}^2$
 - .5 Air Barrier Material, 25-30 mm: $0.00004 \text{ L/s/m}^2 \text{ @ } 75 \text{ Pa}$
 - .6 Water Absorption to ASTM D2842: $< 4\%$
 - .7 Tensile Strength to ASTM D1623: $\geq 200 \text{ kPa}$
 - .8 Compressive Strength to ASTM D1621: $\geq 170 \text{ kPa}$
 - .9 Flame Spread Classification: to ULC S102 and CAN/ULC S127 and as follows:
 - .1 Flame Spread: < 300
 - .2 Smoke Developed: < 400
- .3 Primers: in accordance with manufacturer's recommendations for surface conditions.
 - .1 Maximum VOC limit 100 g/l to SCAQMD Rule 1113.
- .4 Thermal Barrier: Spray applied fire retardant overcoat meeting applicable requirements of the Current Building Code for thermal barrier of foamed plastic.
 - .1 Gypsum/fibre based:
 - .1 Acceptable Materials:
 - .1 A/D Thermal Barrier, Carboline (formerly AD Fire Protection Systems)
 - .2 CafcoBlaze-Shield II, Isolatek International.
 - .3 Monokote Z-3306, WR Grace & Co.
 - .2 Intumescent Coatings:
 - .1 Basis-of-Design Materials:
 - .1 DC315 Intumescent Coating, IFTI

2.2 EQUIPMENT

- .1 Comply with CAN/ULC S705.2 and the equipment manufacturer's recommendations for application type.

2.3 ACCESSORIES

- .1 Prime substrate when required by spray polyurethane manufacturer or the membrane manufacturer. Follow requirements of the manufacturer for the type of primer and the installation of the primer for the surface conditions.

Part 3 Execution

3.1 EXAMINATION

- .1 Inspect areas to receive work of this Section and ensure conditions are suitable to begin application.
- .2 Verify that work penetrating through air seal is complete.
- .3 Verify that appropriate back-up material has been installed in all large voids.
- .4 Confirm wood framing moisture content is suitable (not more than 15%) for installation prior to commencement of work.

3.2 PREPARATION

- .1 Protect finish surfaces which may be exposed to view from overspray.
- .2 Clean substrates of dirt, dust, grease, oil, loose material and other matter which may affect bond of spray applied materials.
- .3 Remove oil from galvanized sheet steel substrates and apply prime coating in accordance with manufacturer's instructions.

3.3 APPLICATION

- .1 Compliance: comply with manufacturer's written recommendations or specifications, including product technical bulletins, handling, storage and installation instructions, and datasheets.
- .2 Apply insulation to clean surfaces in accordance with ULC S705.2, ULC S718, and manufacturer's printed instructions.
- .3 Use primer where recommended by manufacturer.
- .4 Apply sprayed foam insulation in thickness as indicated.
- .5 Remove masking materials and over spray from adjacent areas immediately after foam surface has hardened.
- .6 Repair damaged areas in accordance with manufacturer's application guidelines for insulation.
- .7 Cover spray polyurethane foam with fire retardant overcoat when installed on building interior in accordance with manufacturer's instructions.

3.4 FIELD QUALITY CONTROL

- .1 Manufacturer's Field Services:

- .1 Provide manufacturer's field services consisting of product use recommendations and periodic site visits for inspection of product installation in accordance with manufacturer's instructions.

3.5 CLEANING

- .1 Proceed in accordance with Section 01 74 11 – Cleaning.
- .2 On completion and verification of performance of installation, remove surplus materials, excess materials, rubbish, tools and equipment.

3.6 PROTECTION

- .1 Protect spray polyurethane foam installation from ultraviolet exposure in accordance with manufacturer's requirements.

END OF SECTION

Part 1 General

1.1 SUMMARY

- .1 Section Includes:
 - .1 Self-adhesive air and vapour barrier system materials, mastics, adhesives and accessories.
- .2 Related Requirements:
 - .1 Section 03 30 00 – Cast-In-Place Concrete
 - .2 Section 07 21 13 – Board Insulation
 - .3 Section 07 21 19 – Foam-In-Place Insulation
 - .4 Section 07 52 00 – Modified Bituminous Membrane Roofing
 - .5 Section 07 62 00 – Sheet Metal Flashing and Trim
 - .6 Section 07 92 00 – Sealants
 - .7 Section 08 11 13 – Steel Doors and Frames
 - .8 Section 08 11 16 – Aluminum Doors and Frames
 - .9 Section 08 44 13 – Glazed Aluminum Framed Curtain Walls
 - .10 Section 08 50 13 – Aluminum Windows
 - .11 Section 09 21 16 – Gypsum Board Assemblies

 - .2 ULC 742, Standard for Air Barrier Assemblies – Specification (CAN ULC S742-20).

1.3 ADMINISTRATIVE REQUIREMENTS

- .1 Coordination:
 - .1 Select products to be compatible with adjoining membranes previously installed under related Sections.
 - .2 Select products from a single manufacturer, or products which are compatible from different manufacturers.
 - .3 Coordination between all installers of each component of vapour and air retarder system is essential to ensure continuity of system and that junctions between the various components are effectively sealed.
 - .4 Verify with manufacturers and all tradesmen involved with installation procedures of building products incorporated into air barrier elements including, but not limited to, various membranes, coating and sealants as well as continuity with roofing membrane.
- .2 Pre-installation Meeting:
 - .1 Convene one week before commencing Work of this Section.
 - .2 Arrange for manufacturer's factory-trained agent to be on site at beginning of installation to provide training and supervision of personnel who will install membrane. Agent shall provide frequent inspection visits thereafter to assure quality and competence of membrane installations.
- .3 Sequencing:
 - .1 Sequence work in accordance with Construction Progress Schedule.
 - .2 Sequence work to permit installation of materials in conjunction with related materials and seals.

1.4 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Submit product data in accordance with Section 01 33 00 – Submittal Procedures.
 - .1 Submit manufacturer's printed product literature, specifications and datasheet and include product characteristics, performance criteria, physical size, finish and limitations.
 - .2 Submit Workplace Hazardous Materials Information System WHMIS SDS - Safety Data Sheets.
 - .3 Submit statement from manufacturer(s), indicating products supplied under this Section are compatible with one another and with products previously installed under the work of related Sections.
- .2 Quality Assurance Submittals: submit following in accordance with Section 01 45 00 - Quality Control.
 - .1 Existing Substrate Condition: report deviations, as described in Part Three -EXAMINATION in writing to Consultant.
 - .2 Certificates: submit certificates signed by manufacturer certifying that materials comply with specified performance characteristics and physical properties.
 - .3 Manufacturer's Instructions: submit manufacturer's installation instructions and special handling criteria, installation sequence, cleaning procedures.
- .3 LEED Submittals: provide LEED submittals in accordance with Section 01 61 01 - LEED Product Requirements.

1.5 QUALITY ASSURANCE

- .1 Applicator: company specializing in performing work of this section with minimum three years documented experience with installation of air/vapour barrier systems.
 - .1 Completed installation must be approved by the material manufacturer.
- .2 Single-Source Responsibility: obtain primary air and vapour materials from a single manufacturer regularly engaged in the manufacturing and supply of the specified products and meeting or exceeding the material properties and performance characteristics of the materials and manufacturers named in this Section.
- .3 Mock-ups:
 - .1 Construct mock-up in accordance with Section 01 45 00 - Quality Control.
 - .2 Construct typical exterior wall panel, 3 m long by 4 m wide, incorporating window and frame and sill, insulation, building corner condition, and junction with roof system; illustrating materials interface and seals.
 - .3 Locate where directed.
 - .4 Mock-up may remain as part of finished work.
 - .5 Allow review of mock-up by Consultant before proceeding with air/vapour barrier Work. Accepted mock-up will demonstrate minimum standard of quality required for this project.

1.6 DELIVERY, STORAGE, AND HANDLING

- .1 Deliver, store and handle materials in accordance with Section 01 61 01 - LEED Product Requirements.
- .2 Deliver, store and handle materials in accordance with manufacturer's written instructions.
- .3 Packaging Waste Management
 - .1 Separate and recycle waste materials in accordance with Section 01 74 19 – Construction Waste Management.

1.7 SITE CONDITIONS

- .1 Install solvent curing sealants and vapour release adhesive materials in open spaces with ventilation.
- .2 Ventilate enclosed spaces in accordance with Section 01 51 00 - Temporary Utilities.
- .3 Maintain temperature and humidity recommended by materials manufacturer before, during and after installation.
- .4 Ensure wood has a moisture content less than 19% prior to encapsulating with impermeable membrane.
- .5 Apply air/vapour barrier membrane to gypsum board surfaces which are dry, when temperature is 4 degrees C or higher or as per manufacturer's recommendations.
- .6 Apply air/vapour barrier membrane to cast-in-place concrete, precast concrete, masonry (strike masonry joints flush) which are smooth, clean, dry, and in good condition. Moisture, grease, machine oil or other foreign material must be removed. Concrete must be cured, minimum seven days, and dry before application, and when temperature is 5 degrees C or higher or as per manufacturer's recommendations.
- .7 All membrane shall be installed at surface and ambient temperature of 5°C or above, in dry weather conditions.
- .8 For applications below 5°C consult membrane manufacturer's technical representative for instructions and, obtain Consultant's approval before proceeding with Work.
- .9 Self adhered membrane shall not be applied below application temperature of minus 10 °C despite primers being able to be applied at colder temperatures.

1.8 WARRANTY

- .1 Manufacturer's Warranty: issue and written and signed warranty in the name of the Owner, certifying the product will meet the physical characteristics published by the manufacturer for a period of five years starting from the completion date of installation of membranes.
- .2 Installer's Warranty: Submit installers warranty stating that air and vapour membranes and accessories are installed in accordance with manufacturer's recommendation and that membrane, transitions and through-wall flashing

membranes, primers, mastics, adhesives and sealants are sourced from one manufacturer.

Part 2 Products

2.1 SELF-ADHESIVE AIR AND VAPOUR BARRIER SYSTEM MATERIALS

- .1 Primer: SBS synthetic rubbers, adhesive resins and solvents used to prime porous substrates to enhance adhesion of self-adhesive membranes at temperatures above -10°C.
 - .1 Specific gravity at 20°C (kg/l): 0.79 to 1.0 kg/l.
 - .2 Solids by weight: 24% to 53%.
 - .3 Flash point: -30°C to ASTM D93.
 - .4 Acceptable Materials: manufacturers recommended product.
- .2 Air/Vapour Barrier Membrane (winter application): to CAN/CGSB 37.56 or ASTM D1970; SBS modified bitumen, self-adhering sheet membrane with polyethylene facer, for application temperatures between -10°C and 10°C and as follows:
 - .1 Thickness: 1 mm to 1.5 mm.
 - .2 Tensile strength: 11.3 kN/m to 15.4 kN/m to ASTM D5147.
 - .3 Ultimate elongation: 25% to 40%.
 - .4 Flexibility at cold temperature: minimum -30°C.
 - .5 Air permeability: <0.0003 L/sec. m²
 - .6 Water vapour permeability: <0.05 perm.
 - .7 Static puncture: minimum 178 N.
 - .8 Lap adhesion: 800 N/m.
 - .9 Acceptable Materials:
 - .1 Perm-A-Barrier Wall Membrane LT, GCP Applied Technologies.
 - .2 Blueskin SA LT, Henry Company.
 - .3 AVB LT, IKO.
 - .4 Sopraseal Stick 1100 T, Winter Grade, Soprema.
 - .5 Exoair 110 LT, Tremco Inc.
 - .6 Air Shield LT, W.R. Meadows.
- .3 Air/Vapour Barrier Membrane (summer application): to CAN/CGSB 37.56 or ASTM D1970; SBS modified bitumen, self-adhering sheet membrane with polyethylene facer, for application temperature above 5°C, and as follows:
 - .1 Thickness: 1 mm to 1.5 mm.
 - .2 Tensile strength: minimum 6 kN/m.
 - .3 Ultimate elongation: 25% to 40%.
 - .4 Flexibility at cold temperature: minimum -17°C.
 - .5 Air permeability: <0.0003 L/sec. m²
 - .6 Water vapour permeability: <0.05 perm.
 - .7 Static puncture: 400 N.

- .8 Lap adhesion: minimum 1750 N/m.
- .9 Acceptable Materials:
 - .1 Perm-A-Barrier Wall Membrane, GCP Applied Technologies.
 - .2 Blueskin SA, Henry Company.
 - .3 AquaBarrier AVB, IKO.
 - .4 AVB LT, IKO.
 - .5 Sopraseal Stick 1100, Summer Grade, Soprema.
 - .6 Exoair 110, Tremco Inc.
 - .7 Air Shield, W.R. Meadows.
- .4 Waterproofing Underlayment: self adhering membrane for high temperature applications; rubberized asphalt will not flow up to temperatures as high as 116°C.
 - .1 Primer: as recommended by manufacturer.
 - .2 Acceptable Materials:
 - .1 Ice and Water Shield HT, Grace Construction Products.
 - .2 PE200 HT, Henry
 - .3 Lastobond Shield HT, Soprema.
 - .4 Roofblock HT, Vaproshield
 - .5 Mel-Prime, W.R. Meadows.

2.2 MASTICS AND ADHESIVES

- .1 Waterproofing Mastic: solvent-based mastic containing SBS modified bitumen, fibres and mineral fillers, used to seal around penetrations and extrusions.
 - .1 Compatibility: With air/vapour barrier membrane, substrate and insulation.
 - .2 Specific gravity at 20°C: 1.0 kg/l to 1.12 kg/l.
 - .3 Application Temperature: -10°C to +35°C.
 - .4 Solids by Weight: 70% to 83 %.
 - .5 Acceptable Materials: manufacturers recommended product.

2.3 ACCESSORIES

- .1 Thinner and cleaner for Butyl or Neoprene Sheet: as recommended by sheet material manufacturer.
- .2 Attachments: galvanized steel bars and anchors.
- .3 Roof-to-Wall Transition Membranes: Manufacturer's recommended reinforced self adhesive, compatible with roofing air and vapour membranes and wall materials specified in this Section.
 - .1 Basis-of-Design Materials:
 - .1 Henry Blueskin Butyl Flash for transition with EPDM, PVC and TPO Membranes.
- .4 Through Wall Membranes: Manufacturer's recommended reinforced self adhesive, compatible with air and vapour membrane and that will not become

plastic and extrude onto finished surfaces when exposed to high wall temperatures.

- .1 Acceptable Materials:
 - .1 3015TWF, 3M.
 - .2 Blueskin TWF, Henry Company.
 - .3 TWF, IKO.
 - .4 Sopraseal Stick 1100T, Soprema.
 - .5 Air-Shield TWF, W.R. Meadows
- .5 Sealant: Non-hardening sealant compatible with vapour barrier materials, recommended by membrane manufacturer and In accordance with Section 07 92 00 - Sealants.
- .6 Substrate Primer: adhesive compatible with substrate and vapour barrier materials and as recommended by vapour barrier membrane manufacturer.

Part 3 Execution

3.1 EXAMINATION

- .1 Verify that surfaces and conditions are ready to accept work of this section.
- .2 Verification of Conditions: Verify that conditions of substrate or work previously installed under other Sections are acceptable for air barrier installation in accordance with manufacturer's written recommendations.

3.2 PREPARATION

- .1 Ensure surfaces are clean, dry, sound, smooth, continuous and comply with air barrier manufacturer's requirements.
- .2 Remove loose or foreign matter, which might impair adhesion of materials.
- .3 Ensure substrates are clean of oil or excess dust; masonry joints struck flush, and open joints filled; and concrete surfaces free of large voids, spalled areas or sharp protrusions
- .4 Do not install materials during rain or snowfall.
- .5 Report unsatisfactory conditions to Consultant in writing.
- .6 Do not start work until deficiencies have been corrected.
 - .1 Beginning of Work implies acceptance of conditions.

3.3 INSTALLATION: SELF ADHERING SYSTEM

- .1 Prime surfaces of difficult to stick to substrates using adhesive in accordance with air barrier manufacturer's written recommendations before applying membrane.
- .2 Apply primer to substrates in accordance with manufacturer's written instructions. Apply primer that will be covered with membrane the same day. Re-prime areas that are not covered the same day.

- .3 Align and position self-adhering transition membrane, remove protective film and press firmly into place. Ensure minimum 150 mm overlap at all end and side laps.
- .4 Corner details: Double cover outside and inside corners, use 300 mm wide initial strip of membrane centred on axis of corner. Follow with full width of sheet membrane to cover initial strip completely.
- .5 Construction and control joints: Install membrane in double thickness over properly sealed joints, use 300 mm wide initial strip of membrane centred over joint. Follow with full width of sheet membrane. Assure that joints are properly sealed; joint filler and a compatible sealant are installed.
- .6 Tie-in to window frames, aluminium screens, hollow metal doorframes, spandrel panels, roofing system and at the interface of dissimilar materials as indicated in drawings in order to facilitate a continuous air, vapour & moisture membrane.
- .7 Roll laps and membrane with a counter top roller to effect seal.
- .8 Small protrusions (pipes, etc.) through the waterproofing membrane, should be pre-stripped with a membrane and sealed with mastic.
- .9 Inspect membrane installation meticulously and immediately. Holes and tears in the membrane must be repaired with air / vapour barrier membrane material. The repair must exceed the affected surface area by a minimum of 150 mm. The membrane piece applied for the repair must be sealed around its edges with mastic.
- .10 Laps in membrane to be positively shingle lapped. In any case where construction does not allow for proper sequencing and a negative lap occurs, leading edge to be terminated with compatible mastic.

3.4 INSTALLATION: THROUGH WALL FLASHINGS

- .1 Apply through-wall flashing membrane where detailed on the drawings. Apply through-wall flashing membrane where detailed on the drawings. At openings, extend flashing 200 mm beyond jambs.
- .2 Coordinate installation of through wall flashing with air/vapour barrier of this Section, to ensure a water tight installation and to maintain continuity of the air/vapour barrier. Sequence membrane flashing installation with air/vapour barrier installation, so that air/vapour barrier membrane overlaps top edge of membrane flashing, minimum 50 mm and is completely and continuously sealed in place to maintain air/vapour barrier and to shed water in cavity to the exterior.
- .3 Apply continuous membrane flashing over all ledger angles or supporting sills, extending flashing up behind air/vapour barrier, and up vertical surface minimum 200 mm. Coordinate installation of flashing with installation of air/vapour barrier, so that air/vapour barrier weather laps over membrane flashing to provide a weather tight installation and to maintain continuity of the air/vapour barrier. Extend flashing horizontally over ledger angle or supporting sill, stopping maximum 10 mm from horizontal leg of ledger angle or supporting sill.
- .4 For the application of SBS modified self-adhered through-wall flashings and other applications of SBS modified self-adhered transition membranes, condition the substrate with applicable primer.

- .1 Apply primer at rate recommended by manufacturer to all areas to receive SBS modified self-adhering sheet membrane as indicated on drawings by roller or spray and allow to dry.
- .2 Primed surfaces not covered by self-adhering membrane or self-adhering through-wall flashing membrane during the same working day must be re-primed.
- .5 Prime surfaces and allow to dry, press membrane firmly into place, overlap minimum 50 mm at all side and end laps. Promptly roll all laps and membrane to ensure the seal.
- .6 Ensure applications form a continuous flashing membrane and extend up a minimum of 203 mm up the back-up wall.
- .7 Seal the top edge of the membrane where it meets the substrate using termination sealant. Trowel-apply a feathered edge to seal termination to shed water.
- .8 Ensure through-wall flashing membrane extends fully to the exterior face of the exterior masonry veneer. At locations where flashing terminates or intersects wall openings including door frames, "end dam" flashing to protect openings and redirect water out. Trim off excess as directed by the Consultant.

3.5 FIELD QUALITY CONTROL

- .1 Manufacturer's Field Services:
 - .1 Obtain written report from manufacturer verifying compliance of Work, in handling, installing, applying, protecting and cleaning of product and submit Manufacturer's Field Reports as described in PART ONE - ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS.
 - .2 Provide manufacturer's field services consisting of product use recommendations and periodic site visits for inspection of product installation in accordance with manufacturer's instructions.
 - .3 Schedule site visits, to review Work, as directed in PART ONE - QUALITY ASSURANCE.
- .2 The Consultant shall inspect installed membrane for continuity of air barrier prior to placement of insulation.
- .3 Provide pull adhesion test in accordance with ASTM D4541 for metal and ASTM D7234 for concrete. Provide results to Consultant.
- .4 Non-confirming work and damages: Make repairs to manufacturers written instructions.

3.6 CLEANING

- .1 Proceed in accordance with Section 01 74 11 - Cleaning.
- .2 On completion and verification of performance of installation, remove surplus materials, excess materials, rubbish, tools and equipment.

3.7 PROTECTION

- .1 Protect finished work from penetrations.

Contract Number: RFTC-1868-24-TR88179

- .2 Do not permit adjacent work to damage work of this section.
- .3 Ensure finished work is protected from climatic conditions.

END OF SECTION

Part 1 General

1.1 SUMMARY

- .1 Section Includes:
 - .1 Self adhered air barrier sheet materials, vapour barrier sheet materials and accessories as indicated on Drawings.
- .2 Related Requirements:
 - .1 Section 03 30 00 – Cast-In-Place Concrete
 - .2 Section 04 22 00 – Unit Masonry
 - .3 Section 06 10 00 – Rough Carpentry
 - .4 Section 07 27 19 – Sheet Membrane Air and Vapour Barrier
 - .5 Section 07 46 23 – Wood Siding and Soffit
 - .6 Section 07 62 00 – Sheet Metal Flashing and Trim
 - .7 Section 07 92 00 – Sealants
 - .8 Section 09 21 16 – Gypsum Board Assemblies

1.3 ADMINISTRATIVE REQUIREMENTS

- .1 Coordination:
 - .1 Coordination between all installers of each component of vapour and air retarder system is essential to ensure continuity of system and that junctions between the various components are effectively sealed.

- .2 Verify with manufacturers and all tradesmen involved with installation procedures of building products incorporated into vapour and air retarder elements including, but not limited to, various membranes, coatings and sealants as well as continuity with roofing membrane.

1.4 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Submit product data in accordance with Section 01 33 00 – Submittal Procedures.
 - .1 Submit manufacturer's printed product literature, specifications and data sheet for each product specified.
 - .2 Submit manufacturer's installation instructions including joint treatment recommendations.
 - .3 Product Data: Provide data on material performance criteria and limitations.
 - .4 Shop Drawings: Provide Drawings of special joint conditions.
 - .5 Installation Data: Manufacturer's special installation requirements, including preparation, installation requirements and techniques, product storage and handling criteria.
- .2 LEED Submittals: provide LEED submittals in accordance with Section 01 61 01 - LEED Product Requirements.

1.5 QUALITY ASSURANCE

- .1 Mock-ups:
 - .1 Construct mock-up in accordance with Section 01 45 00 - Quality Control.
 - .2 Construct typical exterior wall panel, 3 m long by 4 m wide, incorporating window openings with frame and sill installed, insulation, building corner condition, junction with roof system; illustrating materials interface and seals.
 - .3 Construct typical underslab installation, minimum 10 sq.m. incorporating insulation, corner condition, junction with foundation; lapping, penetration, illustrating materials interface and seals.
 - .4 Locate where directed by Consultant.
 - .5 Mock-up may remain as part of Work.
 - .6 Allow 24 hours for inspection of mock-up by Consultant before proceeding with air/vapour barrier work.

1.6 DELIVERY, STORAGE, AND HANDLING

- .1 Deliver, store and handle materials in accordance with Section 01 61 01 - LEED Product Requirements.
- .2 Store materials in clean, dry area in accordance with manufacturer's instructions.
- .3 Protect materials during handling and application to prevent damage.
- .4 Packaging Waste Management
 - .1 Separate and recycle waste materials in accordance with Section 01 74 19 – Construction Waste Management.

1.7 SITE CONDITIONS

- .1 Apply air and vapour barrier membrane within the range of ambient and substrate temperatures recommended by air and vapour barrier membrane manufacturer.

Part 2 Products

2.1 SELF ADHERED AIR BARRIER SHEET MATERIALS

- .1 Self-Adhered Air Barrier Membrane: water resistive, vapour permeable, air barrier sheet membrane consisting of laminated modified polyolefin with two layers of non-woven polyethylene and adhesive backing to be protected with three piece release film. Tested to ULC 741 and as follows:
 - .1 Air Permeance: $< 0.02 \text{ L/s/m}^2$ @ 75 Pa in accordance with ASTM E2178 and ULC 741.
 - .2 Air Leakage: pass in accordance with ASTM E2357.
 - .3 Vapour Permeance: >12 perms to ASTM E96, Dessicant method A.
 - .4 Water Vapour Transmission Rate: 202 g/m^2 24 hours maximum.
 - .5 Primer: rubber based adhesive primer for self adhered air barrier as required by membrane manufacturer.
 - .6 Acceptable Materials:
 - .1 Delta Vent SA, Dorken Systems Inc.
 - .2 Blueskin VP160, Henry Company.
 - .3 Majvest 500SA, SIGA SWISS.
 - .4 Air Outshield SA 280, SRP.
 - .5 Wrapsheild SA, Vaproshield, LLC.
 - .6 Air-Shield SMP, W.R. Meadows of Canada.
 - .7 Other materials may be acceptable subject to compliance with requirements, provided information is provided to Consultant for review and acceptance prior to Bid Closing. Only membranes with a minimum of 29 PERMS to ASTM E96 desiccant method A will be considered.
- .2 Termination sealants as recommended by air barrier membrane manufacturer.

2.2 VAPOUR BARRIER SHEET MATERIALS

- .1 Plastic Sheet Vapour Retarder (Exterior Stud Walls): 6 mil polyethylene sheet meeting requirements of CAN/CGSB-51.34.
- .2 Plastic Sheet Vapour Retarder (Underslab): High density, puncture resistant polyolefin resin sheet in accordance with ASTM E1745 and CAN/CGSB-51.34, and as follows:
 - .1 Thickness: 15 mil.
 - .2 Vapour Permeance: Nominal ≤ 0.02 Perms maximum.
 - .3 Tensile Strength and Puncture Resistance: ASTM E1745 Class A minimum.

- .4 Acceptable Materials:
 - .1 VaporFlex, Layfield Construction Materials 15.
 - .2 VaporBlock VB, Raven Industries 15.
 - .3 Stego Wrap, Stego Industries LLC 15 mil.
 - .4 Perminator HP, W.R. Meadows 15 mil.

2.3 ACCESSORIES

- .1 Accessory Materials: Provide manufacturer's required seam tape, pipe boots and vapour proofing mastic forming a complete system in accordance with ASTM E1643.
- .2 Seam Tape: High density, air resistant polyethylene tape with pressure sensitive adhesive. Type as recommended by vapour retarder manufacturer. Minimum 100 mm for lap joints and perimeter seals, 50 mm wide elsewhere.
- .3 Sealant: as recommended by vapour retarder manufacturer in accordance with Section 07 92 00 - Sealants.
- .4 Substrate Crack Filler: Closed cell foam backer rod.
- .5 Through Wall Membranes: Manufacturer's recommended reinforced self adhesive, compatible with air and vapour membrane and that will not become plastic and extrude onto finished surfaces when exposed to high wall temperatures.
 - .1 Acceptable Materials:
 - .1 3015TWF, 3M.
 - .2 Blueskin TWF, Henry Company.
 - .3 TWF, IKO.
 - .4 Sopraseal Stick 1100T, Soprema.
 - .5 Air-Shield SMP, W.R. Meadows
- .6 Flashing Tape: Self-adhering waterproof tape 100 mm wide to AAMA 711 and as recommended by vapour retarder membrane manufacturer.
- .7 Fasteners: Provide non-corrosive metal screws, nails, plastic clips and other fasteners as recommended by air/vapour retarder manufacturer required for complete installation of Work.

Part 3 Execution

3.1 EXAMINATION

- .1 Examine surfaces to receive membrane. Notify consultant if surfaces are not acceptable. Do not begin installation until unacceptable conditions have been corrected.

3.2 INSTALLATION: SELF ADHERED AIR BARRIER SHEET MATERIALS

- .1 Compliance: comply with manufacturer's written recommendations or specifications, including product technical bulletins, handling, storage and installation instructions, and datasheets.

- .2 Apply self adhering air barrier membrane to substrate in overlapping shingle fashion. Stagger all vertical joints.
- .3 Prime surfaces as per manufacturer's instructions and allow to dry.
- .4 Prime surfaces of difficult to stick to substrates using adhesive in accordance with air barrier manufacturer's written recommendations before applying membrane.
- .5 Align self-adhering membrane to substrate, remove top panel of protective release film and press firmly into place.
- .6 Hold membrane in place to avoid tenting, bubbles, and wrinkles and remove remaining panels of protective film and press firmly into place.
- .7 Ensure minimum 64 mm overlap at all end and side laps of membrane applications or as required by Manufacturer.
- .8 Pressure roll all membrane surfaces, laps and flashings with a counter top roller or J-roller to ensure surface adhesion.
- .9 Seal top edge of the membrane at the end of each day with termination sealant. Trowel apply a feathered edge to seal termination and shed water.
- .10 Application of termination sealant:
 - .1 Seal membrane terminations, heads of mechanical fasteners, masonry tie fasteners, around penetrations, duct work, electrical and other apparatus extending through the primary air barrier membrane and around perimeter edge of membrane terminations at window and door frames with termination sealant.

3.3 **INSTALLATION: SHEET VAPOUR BARRIER**

- .1 Compliance: comply with manufacturer's written recommendations or specifications, including product technical bulletins, handling, storage and installation instructions, and datasheets.
- .2 Verify that services are installed and have been accepted by the Consultant and Authorities Having Jurisdiction prior to installation of vapour retarder.
- .3 Pre-strip framing at floors and other changes in plane that cannot be accessed after framing is installed.
- .4 Install sheet vapour retarder on warm side of exterior wall, ceiling, and floor assemblies prior to installation of gypsum board to form continuous retarder in accordance with manufacturers written instructions.
- .5 Use sheets of largest practical size to minimize joints.
- .6 Install materials in a manner that maintains continuity; repair punctures and tears with sealing tape before work is concealed.
- .7 Openings:
 - .1 Cut sheet vapour retarder to form openings and lap and seal to window and door frames in accordance with good building envelope practice.
- .8 Seal perimeter of sheet vapour retarder as follows:
 - .1 Apply continuous bead of sealant to substrate at perimeter of sheets.

- .2 Lap sheet over sealant and press into sealant bead.
- .3 Adhere sheets using sealant bead at each steel framing member and at top and bottom tracks.
- .4 Install sealant bead with no gaps; smooth out folds and ripples occurring in sheet over sealant.
- .9 Seal lap joints of sheet vapour retarder as follows:
 - .1 Attach first sheet to substrate.
 - .2 Apply continuous bead of sealant over solid backing at joint.
 - .3 Lap adjoining sheet minimum 100 mm and press into sealant bead.
 - .4 Adhere sheets using sealant bead at each steel framing member and at top and bottom tracks.
 - .5 Install sealant bead with no gaps; smooth out folds and ripples occurring in sheet over sealant.

3.4 INSTALLATION: UNDERSLAB SHEET VAPOUR BARRIER

- .1 Install vapour barrier in accordance with manufacturer's written instructions and ASTM E1643, and generally as follows:
 - .1 Unroll vapour barrier with the longest dimension parallel to direction of concrete placement.
 - .2 Lap vapour barrier onto face of grade beams.
 - .3 Overlap joints 200 mm and seal with manufacturer's required tape.
 - .4 Seal penetrations including pipe and conduit risers in accordance with manufacturer's written instructions.
 - .5 Make no additional penetrations except as required for placing of reinforcing steel and permanent utilities.
- .2 Repair damaged areas by cutting patches of vapour barrier membrane; sized to overlap damaged area a minimum of 150 mm to each side of puncture; and tape all sides using manufacturer's required tape.

3.5 INSTALLATION: THROUGH WALL FLASHINGS

- .1 Apply through-wall flashing membrane where detailed on the drawings. Apply through-wall flashing membrane where detailed on the drawings. At openings, extend flashing 200 mm beyond jambs.
- .2 Coordinate installation of through wall flashing with air/vapour barrier of this Section, to ensure a water tight installation and to maintain continuity of the air/vapour barrier. Sequence membrane flashing installation with air/vapour barrier installation, so that air/vapour barrier membrane overlaps top edge of membrane flashing, minimum 50 mm and is completely and continuously sealed in place to maintain air/vapour barrier and to shed water in cavity to the exterior.
- .3 Apply continuous membrane flashing over all ledger angles or supporting sills, extending flashing up behind air/vapour barrier, and up vertical surface minimum 200 mm. Extend flashing horizontally over ledger angle or supporting sill, stopping maximum 10 mm from horizontal leg of ledger angle or supporting sill. At openings, extend flashing 200 mm beyond jambs.

- .4 Apply continuous membrane flashing over all ledger angles or supporting sills, extending flashing up behind air/vapour barrier, and up vertical surface minimum 200 mm. Coordinate installation of flashing with installation of air/vapour barrier, so that air/vapour barrier weather laps over membrane flashing to provide a weather tight installation and to maintain continuity of the air/vapour barrier. Extend flashing horizontally over ledger angle or supporting sill, stopping maximum 10 mm from horizontal leg of ledger angle or supporting sill.
- .5 For the application of SBS modified self-adhered through-wall flashings and other applications of SBS modified self-adhered transition membranes, condition the substrate with applicable primer.
 - .1 Apply primer at rate recommended by manufacturer to all areas to receive SBS modified self-adhering sheet membrane as indicated on drawings by roller or spray and allow to dry.
 - .2 Primed surfaces not covered by self-adhering membrane or self-adhering through-wall flashing membrane during the same working day must be re-primed.
- .6 Prime surfaces and allow to dry, press membrane firmly into place, overlap minimum 50 mm at all side and end laps. Promptly roll all laps and membrane to ensure the seal.
- .7 Ensure applications form a continuous flashing membrane and extend up a minimum of 203 mm up the back-up wall.
- .8 Seal the top edge of the membrane where it meets the substrate using termination sealant. Trowel-apply a feathered edge to seal termination to shed water.
- .9 Ensure through-wall flashing membrane extends fully to the exterior face of the exterior masonry veneer. At locations where flashing terminates or intersects wall openings including door frames, "end dam" flashing to protect openings and redirect water out. Trim off excess as directed by the Consultant.

END OF SECTION

Part 1 General

1.1 SUMMARY

- .1 Section Includes:
 - .1 Composite metal panels, face sheets and accessories including; thermally broken clip System, sub-framing thermal spacers, insulation fasteners, isolation tape, blocking and bracing as required for panel system.
- .2 Related Requirements:
 - .1 Section 01 35 00 – Delegated Design
 - .2 Section 06 10 00 – Rough Carpentry

- .7 ASTM C297/C297M-16, Standard Test Method for Flatwise Tensile Strength of Sandwich Constructions.
- .8 ASTM D523-14(2018), Standard Test Method for Specular Gloss.
- .9 ASTM D1781-98(2021), Standard Test Method for Climbing Drum Peel for Adhesives.
- .10 ASTM D1929-23, Standard Test Method for Determining Ignition Temperature of Plastics.
- .4 Canada Green Building Council (CaGBC):
 - .1 LEED Canada V4 – Building Design and Construction (BD+C).
- .5 Canadian Sheet Steel Building Institute (CSSBI):
 - .1 CSSBI 20M-17, Standard for Sheet Steel Cladding for Industrial, Commercial and Institutional Building Applications.
 - .2 CSSBI S8-18, Quality and Performance Specification for Prefinished Sheet Steel Used for Building Products.
- .6 Canadian Standards Association (CSA Group)
 - .1 CSA S157-17/S157.1-17(R2022), Strength Design in Aluminum/Commentary on CSA S157-17, Strength Design in Aluminum.
 - .2 CSA S136-16, North American Specification for the Design of Cold Formed Steel Structural Members
 - .3 CSA W47.2-11(R2020), Certification of Companies for Fusion Welding of Aluminum, Includes Update No. 1 (2011), Update No. 2 (2012).
- .7 Underwriters Laboratories of Canada (ULC):
 - .1 ULC 134, Standard Method of Fire Test of Exterior Wall Assemblies. (CAN/ULC-S134-13).

1.3 ADMINISTRATIVE REQUIREMENTS

- .1 Convene pre-installation meeting one week prior to beginning work of this Section and on-site installation, with Contractor, Consultant, installer, manufacturer's representative to:
 - .1 Verify project requirements.
 - .2 Review installation and substrate conditions.
 - .3 Co-ordination with other building subtrades.
 - .4 Review manufacturer's installation instructions and warranty requirements.

- .2 Manufacturer's representative shall also provide frequent inspection visits during the course of work of this Section to assure quality and competence of panel installation.

1.4 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Submit product data in accordance with Section 01 33 00 – Submittal Procedures:
 - .1 Submit manufacturer's printed product literature, specifications and datasheet.
 - .2 Submit Workplace Hazardous Materials Information System WHMIS SDS - Safety Data Sheets acceptable to Labour Canada, and Health and Welfare Canada.
- .2 Submit shop drawings in accordance with Section 01 33 00 – Submittal Procedures and Section 01 35 00 – Delegated Design:
 - .1 Indicate layout, profiles and product components including anchorage, accessories, finish colours and textures.
 - .2 Include details showing thickness and dimensions of the various system parts, fastening and anchoring methods, locations of joints and gaskets and location and configuration of movement joints.
- .3 Submit samples in accordance with Section 01 33 00 – Submittal Procedures:
 - .1 Submit duplicate 300 x 300 mm samples of composite panel in thickness specified from representative materials, finishes and colours. Include clips, anchors, supports, fasteners, closures, and other panel accessories for assembly approval.
- .4 Manufacturer's Instructions:
 - .1 Submit manufacturer's installation instructions and special handling criteria, installation sequence and cleaning procedures.
- .5 Submit quality control submittals in accordance with Section 01 45 00 - Quality Control.
 - .1 Test Reports: certified test reports showing compliance with specified performance characteristics and physical properties.
 - .2 Certificates: submit certificates signed by manufacturer certifying that composite wall panels comply with specified performance characteristics and physical properties.
 - .3 Manufacturer's Field Reports: submit to manufacturer's written reports within three days of review, verifying compliance of Work, as described in FIELD QUALITY CONTROL.
- .6 LEED Submittals: provide LEED submittals in accordance with Section 01 61 01 - LEED Product Requirements.

1.5 QUALITY ASSURANCE

- .1 Installer Qualifications: Engage experienced installer with a minimum of five years experience who has completed systems similar in material, design, and extent to that indicated for Project and with record of successful performance and is approved by manufacturer.

- .2 Retain a professional engineer, registered in the province of the Work, to design fabrication and erection of the Work of this Section in accordance with applicable Building Code and Contract Document requirements including, but not limited to, the following:
 - .1 Seal and signature to shop drawings and design submittals requiring structural engineering.
 - .2 Site review and certification of installed components.
 - .3 Completion of Letters or Commitment and Supervision specified in Section 01 35 00 – Delegated Design.
 - .4 Manufacturer's Engineering Recommendations: Perform composite wall panel work in accordance with written recommendations from panel manufacturer.
 - .5 Verify panel thickness based on maximum deflections provided in this Section and to suit building location and configuration.
- .3 Mock-ups:
 - .1 Mock-ups: construct mock-ups in accordance with Section 01 45 00 - Quality Control and to requirements supplemented as follows:
 - .1 Provide mock-up for evaluation of surface finishes and workmanship.
 - .2 Construct mock-up indicating relationship between wall panels, air spaces, air/vapour retarder membrane, windows, and doors.
 - .3 Co-ordinate type and location of mock-ups with project requirements.
 - .4 Accepted units will be used as standard for acceptance of production units.
 - .5 Remove and replace units which are not accepted.
 - .6 Do not proceed with remaining work until workmanship, colour, and finish are reviewed by Consultant.
 - .7 Refinish mock-up area as required to produce acceptable work.
 - .8 When accepted, mock-up will demonstrate minimum standard of quality required for this work.
 - .1 Approved mock-up may remain as part of finished work.

1.6 DELIVERY, STORAGE, AND HANDLING

- .1 Deliver, store and handle materials in accordance with Section 01 61 01 - LEED Product Requirements.
- .2 Deliver, store and protect material in accordance with panel manufacturer's recommendations.
- .3 Do not expose panels with strippable film to direct sunlight or extreme heat.
- .4 Packaging Waste Management
 - .1 Separate and recycle waste materials in accordance with Section 01 74 19 – Construction Waste Management.

1.7 WARRANTY

- .1 Special warranties specified in this Article shall not deprive the Owner of other rights the Owner may have under other provisions of the Contract Documents and shall be in addition to, and run concurrent with other warranties made by the Contractor under requirements of the Contract Documents.
- .2 Special Finish Warranty: Submit a written warranty, signed by manufacturer, covering failure of the factory-applied exterior finish on metal wall panels within the specified warranty period and agreeing to repair finish or replace wall panels that show evidence of finish deterioration. Deterioration of finish includes, but is not limited to, colour fade, chalking, cracking, peeling, and loss of film integrity for a period of 20 years from date of Substantial Performance.

Part 2 Products

2.1 MANUFACTURERS

- .1 Acceptable Manufacturers: Subject to compliance with requirements specified in this Section and as established by the Basis-of-Design Materials, manufacturers offering products that may be incorporated into the Work include; but are not limited to, the following:
 - .1 Alucobond Plus, Alcan Composites Inc.
 - .2 Alcotex, Alcotex Inc.
 - .3 Accumet 2000, Flynn.
 - .4 Alpolic, Mitsubishi Chemical.
 - .5 Reynobond, Reynolds American Manufacturing.

2.2 PERFORMANCE/DESIGN CRITERIA

- .1 Maximum deflection not to exceed L/180 under system's own weight plus wind load (positive and negative) loads acting normal to the plane in accordance with the Building Code Climatic Data, wind load 1:30 years.
- .2 Calculate live load deflections in accordance with CSSBI 20M, as modified by the requirements of this Section.
- .3 Provide for movement of components without causing buckling, failure of joint seals, undue stress on fasteners when subject to seasonal temperature range from -40°C (-40°F) to +50°C (120°F), and seismic and wind loads noted.
- .4 Include expansion joints to accommodate movement in wall system and between wall system and building structure, where these movements are caused by deflection of building structure, and accommodate these movements, without permanent distortion, damage to infills, racking of joints, breakage of seals, or water penetration.
- .5 Provide for positive drainage to the exterior of all water entering or condensation occurring within the system.
- .6 Final review and acceptance of work completed by this Section shall be carried out by the manufacturer's representative, the Consultant, Contractor and the Subcontractor.

2.3 COMPOSITE METAL PANEL MATERIALS

- .1 Composite aluminum panel: Aluminum sheets thermally bonded in continuous process, under tension, to thermoplastic core with no glues or adhesives between dissimilar materials, and as follows:
 - .1 Total Composite Thickness: 4 mm
 - .2 Aluminum Face Sheets:
 - .1 Thickness: 0.51 mm.
 - .2 Factory Finish: coil coated with fluoropolymer paint to AAMA 2605
 - .3 Colour: as indicated on Drawings.
 - .3 Core: non-combustible, in accordance with ULC 134.
 - .4 Bond Integrity: tested for resistance to delamination as follows:
 - .1 Bond Strength: 10.3 MPa minimum to ASTM C297.
 - .2 Peel Strength: 100 N mm/mm minimum to ASTM D1781.
 - .3 No degradation in bond performance after 8 hours of submersion in boiling water and after 21 days of immersion in water at 21 degrees C.
- .2 Aluminum extrusions:
 - .1 Alloy: AA-6063-T5.
 - .2 Colour: Mill finish where non-exposed.
- .3 Stiffeners:
 - .1 Alloy: AA-6063-T5.
 - .2 Colour: Mill finish.

2.4 SYSTEM BACK-UP MATERIALS

- .1 Girts: Fabricated from minimum 1.27 mm thickness galvanized steel to ASTM A653, Grade 230 with Z275 coating. Material visible after assembly of wall panel shall be finished to match aluminum panels.
- .2 Sub-girts: Structural quality steel to ASTM A653, with Z275 zinc coating, adjustable double-angle profile as indicated to accept panel with structural attachment to building frame.
- .3 Provide blocking and bracing required for panel system.
- .4 Isolation Tape: Manufacturers standard material for separating dissimilar metals from direct contact.
- .5 Stiffeners, as required: Minimum 25 mm x 25 mm aluminum, bonded to the full length of face sheet using double sided high bond isolating tape to prevent weather staining and frost lines to the face of the panel. Bonding tape to be protected with continuous bead of caulking on both sides of stiffeners, type as recommended by manufacturer.
- .6 Insulation Fastenings: Corrosion resistant, galvanized bugle head screws with 38 mm diameter washer, 25 mm minimum penetration into framing.

2.5 FABRICATION

- .1 Aluminum wall panels and components shall comply with details as indicated on drawings and as indicated in shop drawings.
- .2 All components shall be factory fabricated ready for field installation. All components shall match quality and installation of accepted mock-up specified above.
- .3 Tolerances:
 - .1 Panel bow shall not exceed 0.8% of panel overall dimension in width or length.
 - .2 Panel dimensions shall allow for field adjustment and thermal movement.
 - .3 Panel lines, breaks and curves shall be sharp, smooth and free of warps or buckles.
 - .4 Panel shall be visually flat.
 - .5 Panel surfaces shall be free of scratches or marks caused during fabrication.

2.6 ACCESSORIES

- .1 Panel Stiffeners: structurally fastened or restrained at ends, secured to rear face of composite panel with silicone or double sided high bond isolating tape to prevent weather staining and frost lines to the face of the panel as recommended by panel manufacturer, size stiffeners to maintain panel flatness to specified tolerances, material as recommended by manufacturer.
- .2 System Sealants: Sealants within the panel system, as recommended by manufacturer, colour as selected by Consultant.
- .3 Gaskets: Santoprene or EPDM as recommended by manufacturer.
- .4 Flashings: Fabricate flashing from 1.57 mm minimum thickness aluminum sheet. Where exposed to view, finish to match adjacent panels. Provide lap strip under flashing at abutted conditions; with lapped surfaces sealed with a full-bed of non-hardening sealant.
- .5 Fasteners:
 - .1 Attachment of the panel system to the primary panel structural supports shall be made using manufacturer's recommended fasteners.
 - .2 Typical joinery shall be attached with concealed, non-corrosive fasteners. When exposed fasteners are required in isolated conditions, the fastener shall be obscured in the panel joinery, exposed fasteners shall be stainless steel.

Part 3 Execution

3.1 PREPARATION

- .1 Obtain all dimensions from job site.
- .2 Ensure all structural support is aligned and condition is acceptable.

- .3 Building surfaces shall be smooth, clean and dry, and free from defects detrimental to the installation of the system. Notify Contractor of conditions not acceptable for installation of system.
- .4 Inspect wall system and components before installation and verify that there is no shipping damage.
- .5 Do not install damaged panels; repair or replace as required for smooth and consistent finished appearance.

3.2 INSTALLATION

- .1 Compliance: comply with manufacturer's written recommendations or specifications, including product technical bulletins, handling, storage and installation instructions, and datasheets.
- .2 Install composite panels in accordance with manufacturer's written instructions and shop drawings.
 - .1 Allow for thermal movement.
- .3 Install air/vapour retarder membrane in accordance with Section 07 27 13 - Modified Bituminous Air and Vapour Barrier and the manufacturer's instructions.
- .4 Install both layers of girts as indicated on drawings and to ensure no air gap between girts and insulation boards.
- .5 Install girts attached to structural support or wall framing, using recommended fasteners.
- .6 Install insulation between girts forming tight to following applied girt to maintain continuous thermal barrier.
- .7 Erect panels plumb, level and true.
- .8 Do not install component parts that are observed to be defective, including warped, bowed, dented, scraped and broken members.
- .9 Install exterior metal cladding to structural support by hidden mechanical fasteners.
- .10 Ensure fasteners penetrate wall framing. Where fastener does not penetrate framing, DO NOT remove fastener. Removal of fastener will damage integrity of air/vapour membrane. Realign fastener location and install new fastener in close proximity to original fastener.
- .11 Install pre-formed corners and end enclosures, sealed to arrest direct weather penetration.
- .12 Ensure panels aligned vertically and horizontally.
- .13 Assemble and secure wall system so stresses on sealants are within manufacturers' recommended limits.
- .14 Separate dissimilar metals; use appropriate gasket and fasteners to minimize corrosive or electrolytic action between metals.
- .15 Install flashings to divert all moisture and condensation to exterior. Trim and flash around doors, louvers, and windows. Use only membrane flashing supported by insulation per architectural details.

3.3 FIELD QUALITY CONTROL

- .1 Have manufacturer of products supplied under this Section review Work involved in handling, installation/application, protection and cleaning of its products, and submit written reports in acceptable format to verify compliance of Work with Contract.
- .2 Manufacturer's field services: Provide manufacturer's field services consisting of product use recommendations and periodic site visits for inspection of product installation in accordance with manufacturer's instructions.
- .3 Schedule site visits to review Work at stages listed:
 - .1 After delivery and storage of products, and when preparatory Work on which Work of this Section depends is complete, but before installation begins.
 - .2 Twice during progress of Work at 25% and 60% complete.
 - .3 Upon completion of Work, after cleaning is carried out.
- .4 Submit reports to Consultant within three days of review.

3.4 CLEANING

- .1 Remove strippable film coating (if used) as soon as possible after surrounding material has been installed.
- .2 Remove all excess materials, debris and equipment at completion.
- .3 Clean all panels clean and free of all grime and dirt.
- .4 Touch-up damaged finishes with manufacturer's recommended touch-up paint.

END OF SECTION

Part 1 General

1.1 SUMMARY

.1 Section Includes:

- .1 Metal sheet and cladding system including accessories, closure strips, sub-framing thermal spacers, girts and sub-girts, clips and connectors, expansion joints, stiffeners, insect and rodent screens, sealants and fasteners. Provide blocking and bracing required for panel system.

.2 Related Requirements:

1.3 ADMINISTRATIVE REQUIREMENTS

- .1 Convene pre-installation meeting one week prior to beginning work of this Section and on-site installation, with Contractor, Consultant, installer, manufacturer's representative to:
 - .1 Verify project requirements.
 - .2 Review installation and substrate conditions.
 - .3 Co-ordination with other building subtrades.
 - .4 Review manufacturer's installation instructions and warranty requirements.
- .2 Manufacturer's representative shall also provide frequent inspection visits during the course of work of this Section to assure quality and competence of membrane installation and panel alignment.

1.4 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Submit product data in accordance with Section 01 33 00 – Submittal Procedures:
 - .1 Submit manufacturer's printed product literature, specifications and datasheet.
 - .2 Submit WHMIS SDS - Safety Data Sheets acceptable to Labour Canada, and Health and Welfare Canada. Indicate VOC's:
 - .1 Caulking and sealant materials during application and curing.
 - .2 Finishing materials.
 - .3 Insulation adhesives.
 - .4 Paints.
 - .5 Isolation coatings.
- .2 Submit shop drawings in accordance with Section 01 33 00 – Submittal Procedures and Section 01 35 00 – Delegated Design:
 - .1 Indicate arrangement of cladding system including dimensions, wall openings, location of joints, profiles of inner and outer skin, types and locations of supports, fasteners, flashing, closures, compliance with design criteria and requirements of related work.
- .3 Submit samples in accordance with Section 01 33 00 – Submittal Procedures:
 - .1 Submit duplicate 300 x 300 mm samples of wall system, representative of materials, finishes and colours.

- .2 Prior to ordering materials, provide to consultant the following for verification purposes: three samples of colour of finish specified.
- .4 Manufacturer's Instructions:
 - .1 Submit manufacturer's installation instructions.
- .5 Manufacturers' Field Reports: Submit copies of manufacturers field reports.
- .6 LEED Submittals: provide LEED submittals in accordance with Section 01 61 01 – LEED Product Requirements.

1.5 QUALITY ASSURANCE

- .1 Test Reports: certified test reports showing compliance with specified performance characteristics and physical properties.
- .2 Certificates: product certificates signed by manufacturer certifying materials comply with specified performance characteristics and criteria and physical requirements.
- .3 Installer Qualifications: Engage experienced installer, with a minimum of five years experience, who has completed systems similar in material, design, and extent to that indicated for Project and with record of successful performance.
- .4 Retain a professional engineer, registered in the province of the Work, to design fabrication and erection of the Work of this Section in accordance with applicable Building Code and Contract Document requirements including, but not limited to, the following:
 - .1 Seal and signature to shop drawings and design submittals requiring structural engineering.
 - .2 Site review and certification of installed components.
 - .3 Completion of Letters or Commitment and Supervision specified in Section 01 35 00 – Delegated Design.
 - .4 Manufacturer's Engineering Recommendations: Perform composite wall panel work in accordance with written recommendations from panel manufacturer.
 - .5 Verify panel thickness based on maximum deflections provided in this Section and to suit building location and configuration.
- .5 Mock-ups:
 - .1 Construct mock-up in accordance with Section 01 45 00 – Quality Control.
 - .2 Construct a portion of one exterior wall in location agreed upon by Consultant to establish a standard of construction, workmanship, and appearance.
 - .3 Construct mock-up indicating relationship between wall panels, air spaces, air/vapour retarder membrane, windows, and doors.
 - .4 Do not continue with work of this Section until Consultant has approved mock-up.
 - .5 When accepted, mock-up will demonstrate minimum standard of quality required for this work. Approved mock-up may remain as part of finished Work.

1.6 DELIVERY, STORAGE, AND HANDLING

- .1 Deliver and store materials in accordance with manufacturer's instructions.
- .2 Protect panels during transportation, unloading, storing, and erecting to prevent bending, warping, twisting, and surface damage.
- .3 Packaging Waste Management
 - .1 Separate and recycle waste materials in accordance with Section 01 74 19 – Construction Waste Management.

1.7 WARRANTY

- .1 Provide the manufacturers standard warranty with the minimum coverage of 20 years for the paint finish against chalking, fading, peeling, checking, cracking, or colour change.

Part 2 Products

2.1 MANUFACTURERS

- .1 Acceptable Manufacturers: Subject to compliance with requirements specified in this Section and as established by the Basis-of-Design Materials, manufacturers offering products that may be incorporated into the Work include; but are not limited to, the following:
 - .1 VicWest Steel.
 - .2 Westform Metals.
 - .3 Westman Steel.

2.2 PERFORMANCE/DESIGN CRITERIA

- .1 Design metal panel wall system in accordance with CSA S136.
- .2 Design metal panel wall to provide for thermal movement of component materials caused by ambient temperature range of 60 degrees C without causing buckling, failure of joint seals, undue stress on fasteners or other detrimental effects.
- .3 Include expansion joints to accommodate movement in wall system and between wall system and building structure, caused by structural movements, without permanent distortion, damage to infills, racking of joints, breakage of seals, or water penetration.
- .4 Design members to withstand dead load and wind loads calculated in accordance with Ontario Building Code and applicable local regulations, to maximum allowable deflection of 1/180th of span.
- .5 Provide for positive drainage of condensation occurring within wall construction and water entering at joints, to exterior face of wall in accordance with NRC "Rain Screen Principles".
- .6 Permeance through wall system not to exceed 1 ng/(Pa.s.m²).
- .7 Design wall system to accommodate specified erection tolerances of structure.
- .8 Design wall system to allow for movement of air between exterior and interior side of metal cladding.

- .9 Provide an effective air barrier, to prevent infiltration and/or exfiltration of air through wall assembly.

2.3 METAL CLADDING MATERIALS

- .1 Aluminum-zinc galvanized sheet steel cladding: AZM180 galvalume sheet steel applied to both sides, commercial steel (CS), type A, grade 275 to ASTM A792/A792M and as follows:
 - .1 Nominal Core Thickness: 0.76 mm or thicker to meet design loads.
 - .2 Profile: to match VicWest corrugated profile having nominal 880 mm panel c/c with 40 mm deep profile at 68 mm c/c.
 - .3 Galvanizing Coating: Dofasco Inc., Galvalume Plus.
 - .4 Finish: prefinished as specified below.
 - .5 Basis of Design Materials:
 - .1 1 9/16" CL7040 Corrugated, VicWest Steel.
 - .2 1 9/16" Corrugated, Westform Metals.

2.4 PREFINISHED STEEL SHEET

- .1 Prefinished steel with factory applied silicone modified polyester (SMP).
 - .1 Class: F1S.
 - .2 Colour: indicated on Drawings.
 - .3 Specular gloss: 25-35 units +/-5 to ASTM D523 for matte finish.
 - .4 Coating thickness: dry film thickness not less than 0.9 mil to ASTM D4138.
 - .5 Resistance to accelerated weathering for chalk rating of eight, colour fade five units or less and erosion rate less than 20% to ASTM D2244 and ASTM D659.

2.5 ACCESSORIES

- .1 Closure strips:
 - .1 Closed Cell Closure Strips: Provide minimum 25.4 mm thick matching metal wall panel profile.
 - .2 Metal Profile Closure Strips: Shall be fabricated from same gauge, material and finish as metal panel.
- .2 Provide blocking and bracing required for panel system.
- .3 Girts: Fabricated from minimum 1.27 mm thickness galvanized steel to ASTM A653/A653M, Grade 230 with Z275 coating. Material visible after assembly of wall panel shall be finished to match aluminum panels.
- .4 Sub-girts: Structural quality steel to ASTM A653/A653M, with Z275 zinc coating, adjustable double-angle profile as indicated to accept panel with structural attachment to building frame.
- .5 Fasteners: Manufacturer's standard to suit design loads and applications.
 - .1 Screws to ANSI B18.6.3. Purpose made stainless steel; exposed parts to match finish of exterior sheet.

- .6 Sealant: as indicated in Section 07 92 00 - Sealants and as recommended by manufacturer. Colour of exposed sealant to match adjacent panel.
- .7 Isolation coating: bituminous paint.
- .8 Clips and Connectors: As recommended by manufacturer for complete installation of cladding.
- .9 Exterior corners: of same profile, material and finish as adjacent cladding material, shop cut and brake formed to required angle, concealed corner brace, mechanically fasten connections with painted head to match cladding.
- .10 Exposed joint (perpendicular to profile): ends of cladding sheet shop cut clean and square, backed with tight fitting filler lapping back of joint, exposed components colour matched to cladding.
- .11 Accessories: cap flashings, drip flashings, internal corner flashings, copings and closures for head, jamb, sill and corners, of same material, thickness and finish as exterior cladding, brake formed to shape.
- .12 Expansion joints: as recommended by Manufacturers Instructions.
- .13 Stiffeners: metal stiffeners as shown in drawings.
- .14 Insect and rodent screen: linear perforated aluminum screen sized to suit application.

Part 3 Execution

3.1 PREPARATION

- .1 Protect metal surfaces in contact with concrete, masonry mortar, plaster or other cementitious surface with isolation coating.
- .2 Touch up building framing members with primer as required.

3.2 INSTALLATION

- .1 Compliance: Comply with manufacturer's written data, including product technical bulletins, product catalogue installation instructions, product carton installation instructions, and data sheets.
- .2 Install continuous starter strips, inside and outside corners, edgings, soffit, drip, cap, sill and window/door opening flashings as indicated.
- .3 Install outside corners, fillers and closure strips with carefully formed and profiled work.
- .4 Maintain joints in exterior cladding, true to line, tight fitting, hairline joints.
- .5 Attach components in manner not restricting thermal movement.
- .6 Provide weatherproof escutcheons for pipe and conduit penetrating exterior walls.
- .7 Caulk junctions with adjoining work with sealant. Do work in accordance with Section 07 92 00 - Sealants.
- .8 Control/ Expansion Joints
 - .1 Construct control and expansion joints as indicated.

- .2 Use cover sheets, of brake formed profile, of same material and finish as adjacent material.
- .3 Use mechanical fasteners to secure sheet materials.
- .4 Assemble and secure wall system to structural frame so stresses on sealants are within manufacturers' recommended limits.
- .9 Construction
 - .1 Installation Tolerances: Shim and align panels and cladding system within installed tolerance of 6 mm in 6100 mm on level, plumb, and location lines as indicated, and within 3 mm offset of adjoining faces and of alignment of matching profiles.

3.3 FIELD QUALITY CONTROL

- .1 Have manufacturer of products supplied under this Section review Work involved in handling, installation/application, protection and cleaning of its products, and submit written reports in acceptable format to verify compliance of Work with Contract.
- .2 Manufacturer's field services: Provide manufacturer's field services consisting of product use recommendations and periodic site visits for inspection of product installation in accordance with manufacturer's instructions.
- .3 Schedule site visits to review Work at stages listed:
 - .1 After delivery and storage of products, and when preparatory Work on which Work of this Section depends is complete, but before installation begins.
 - .2 Twice during progress of Work at 25% and 60% complete.
 - .3 Upon completion of Work, after cleaning is carried out.
- .4 Submit reports to Consultant within three days of review.

3.4 CLEANING

- .1 Perform cleaning after installation to remove construction and accumulated environmental dirt.
- .2 Wash down exposed interior and exterior surfaces using solution of mild domestic detergent in warm water, applied with soft clean wiping cloths. Wipe interior surfaces clean as part of final clean-up.
- .3 Remove excess sealant with recommended solvent.
- .4 Upon completion of installation, remove surplus materials, rubbish, tools and equipment barriers.

END OF SECTION

Part 1 General

1.1 SUMMARY

- .1 Section Includes:
 - .1 Zinc galvanized sheet steel and stainless steel insulated metal panels and accessories including flashings, enclosures, trims, fasteners, washers, liquid sealants, preformed sealants and sealing tape.
- .2 Related Requirements:
 - .1 Section 01 35 00 – Delegated Design
 - .2 Section 05 50 00 – Metal Fabrications
 - .3 Section 07 21 13 – Board Insulation
 - .4 Section 07 62 00 – Sheet Metal Flashing and Trim
 - .5 Section 07 92 00 – Sealants

 - .8 ULC 770, Standard Test Method for Determination of Long-Term Thermal Resistance of Closed-Cell Thermal Insulating Foams (CAN/ULC S770-15).

1.3 ADMINISTRATIVE REQUIREMENTS

- .1 Coordination: Coordinate work of this Section with work of other sections that may have items supported by or built into fabricated wall panel assemblies

including; but not limited to, supports and connectors to structure, doors and windows, mechanical and electrical components, metal flashing and trim and erection tolerances.

- .2 Convene pre-installation meeting in accordance with Section 01 31 19 – Project Meetings one week prior to beginning work of this Section with Contractor, Consultant, installer, and manufacturer's representative to:
 - .1 Verify project requirements.
 - .2 Review installation and substrate conditions.
 - .3 Co-ordination with other building subtrades.
 - .4 Review manufacturer's installation instructions and warranty requirements.

1.4 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Submit product data in accordance with Section 01 33 00 – Submittal Procedures:
 - .1 Submit manufacturer's product specifications, standard details, certified product test results, and general recommendations as applicable to materials and finishes for each component and for total panel assemblies.
- .2 Submit shop drawings in accordance with Section 01 33 00 – Submittal Procedures:
 - .1 Provide plans, elevations and section showing panel details, attachment to structural support and indicate the following:
 - .1 Profile of panels.
 - .2 Gauge of exterior and interior sheet.
 - .3 Location, layout and dimensions of panels.
 - .4 Corner conditions.
 - .5 Location and type of fasteners.
 - .6 Shape and method of attachment of trim.
 - .7 Other details as required for a complete and weathertight installation.
- .3 Submit samples in accordance with Section 01 33 00 – Submittal Procedures:
 - .1 Submit two (2) 300 mm x 300 mm samples representing specified profile, colour and texture, and other exposed panel accessories for verification and acceptance by the Consultant.
- .4 Submit quality assurance submittals in accordance with Section 01 45 00 - Quality Control.
 - .1 Source Quality Control Submittals: Submit design notes and calculations signed and sealed by professional engineer indicating compliance with design criteria for work of this Section.
 - .2 Manufacturer's Instructions: submit manufacturer's installation instructions and special handling criteria, installation sequence, and cleaning procedures.
- .5 LEED Submittals: provide LEED submittals in accordance with Section 01 35 21 – LEED Requirements.

1.5 QUALITY ASSURANCE

- .1 Regulatory Requirements: Provide panels that are listed and labelled in accordance with CAN/ULC S101, ULC S102 and CAN/ULC S134 for fire endurance and flame spread testing
- .2 Qualifications: Provide proof of qualifications when requested by Consultant:
 - .1 Manufacturer: Use a manufacturer that has completed wall panel assemblies having similar extent and complexity as required for the Work of this Contract.
 - .2 Installers: Use experienced installers having experience with specified insulated wall panel projects similar in material, design and extent as required for Work of this Contract with a record of five successful years in-service performance.
- .3 Retain a professional engineer, registered in the province of the Work, to design fabrication and erection of the Work of this Section in accordance with applicable Building Code and Contract Document requirements including, but not limited to, the following:
 - .1 Seal and signature to shop drawings and design submittals.
 - .2 Field review of installed components.
 - .3 Completion of Letters or Commitment and Supervision specified in Section 01 35 00 – Delegated Design.
- .4 Mock-ups:
 - .1 Construct mock-up in accordance with Section 01 45 00 – Quality Control.
 - .2 Construct a portion of one exterior wall in location agreed upon by Consultant to establish a standard of construction, workmanship, and appearance.
 - .3 Do not continue with work of this Section until Consultant has reviewed mock-up.

1.6 DELIVERY, STORAGE, AND HANDLING

- .1 Deliver, store and handle materials in accordance with Section 01 61 01 - LEED Product Requirements and as recommended by manufacturer's instructions.
- .2 Deliver panel materials and components in manufacturer's original, unopened, undamaged packaging with identification labels intact.
- .3 Store wall panels on dry, level, firm, and clean surface. Stack materials on platforms or pallets no more than two bundles high.
- .4 Packaging Waste Management
 - .1 Separate and recycle waste materials in accordance with Section 01 74 19 – Construction Waste Management.

1.7 WARRANTY

- .1 Manufacturer's Warranty: Submit manufacturer's standard two year warranty that panels are free from defects in materials and workmanship beginning from the

date of substantial completion. Manufacturer's warranty is in addition to other rights contained within the Contract Documents.

Part 2 Products

2.1 MANUFACTURERS

- .1 Acceptable Manufacturers: Subject to compliance with requirements specified in this Section, meeting energy model requirements, and as established by the Basis-of-Design Materials, manufacturers offering products that may be incorporated into the Work include; but are not limited to, the following:

- .1 [Centria Architectural Systems.](#)
- .2 [Falk Panels Canada Ltd.](#)
- .3 Kingspan Insulated Panels Ltd.
- .4 Metl-Span LLC, A BlueScope Steel Company.
- .5 Vicwest, Insulated Metal Panels.

2.2 PERFORMANCE/DESIGN CRITERIA

- .1 Design fabricated wall panel assemblies to meet or exceed the following minimum requirements:
- .1 Structural Performance: Design panel composition and fastening requirements in accordance with ASTM E72 based on the following deflection criteria:
 - .1 Live Loads: Determine live load deflections in accordance with CSSBI 20M, as modified by the requirements of this Section.
 - .2 Wind Load: Determine wind loads using normal importance factors listed in the Building Code for deflection and strength, modified by the appropriate exposure, gust and pressure (internal and external) factors in accordance with Building Code structural commentaries.
 - .3 Deflection Limitation: L/180 based on maximum allowable deflection under one in 50 year sustained wind loading.
 - .4 Fatigue: Withstand two million alternate cycles of specified deflection limitation with no delamination of face skins from core, foam core cracking or permanent deformation.
 - .5 Movement: Allow for movement of components without causing buckling, failure of joint seals, undue stress on fasteners when subjected to seasonal surface temperatures ranging from -35°C to +50°C, and to accommodate movement between wall system and building structure by deflection of building structure and seismic loads as indicated in the building code.
 - .2 Fire Performance
 - .1 Flame Spread Tests: Provide materials with the following surface-burning characteristics in accordance with ASTM E84 and CAN/ULC S101 and as follows:
 - .1 Flame Spread Index: 25 or less.

- .2 Smoke Developed Index: 450 or less.
- .2 Fire Endurance Test: Panels to remain in place for not less than 15 minutes in accordance with CAN/ULC S101.
- .3 Fire Growth Test: Provide panels tested in accordance with CAN/ULC S138.
- .4 Flammability Test: Panels tested in accordance with CAN/ULC S127.
- .5 The finished panel in a 152 mm thickness shall meet the requirements for Assembly Rating – two Hour fire endurance rating; Non-Load Bearing Wall Assembly in accordance with ZOL/WA 120-02 design, ASTM E119, CAN/ULC-S101.
- .3 Air and Moisture Performance: Design panel joints to resist and control air and rainwater penetration using pressure equalization and rain screen technique to the following maximum limits:
 - .1 Air Infiltration: Maximum 0.3 L/m² of wall area at 0.95 kPa pressure differential in accordance with ASTM E283/E283M.
 - .2 Water Penetration: Zero uncontrolled water penetration at 0.95 kPa pressure differential in accordance with ASTM E331.
 - .3 Provide for positive drainage to the exterior of all water entering or condensation occurring within the system.
- .4 Thermal Performance: Design wall thickness of fabricated wall panels using nominal long term thermal resistance of RSI 1.15 per 25 mm of polyurethane thickness in accordance with ASTM C1363.

2.3 MATERIALS

- .1 Zinc Galvanized Sheet Steel: Tension levelled, Commercial Steel (CS) designation, Type A, Grade 230 in accordance with ASTM A653/A653M or ASTM A792/A792M to manufacturer's standard and as follows:
 - .1 Thickness: Provide sheet steel in the following base metal thickness, or thicker as required to meet design loads:
 - .1 Liner Sheet: Minimum 0.46 mm.
 - .2 Exterior Sheet: Minimum 0.46 mm.
 - .2 Galvanizing Designation: Z275 or AZM 150 applied evenly to both sides.
- .2 Core Material (non-rated): Foamed in place multi-component polyisocyanurate or polyurethane insulation; blown using Montreal Protocol compliant agents having zero ozone depletion potential and having the following physical properties based on CAN/ULC S705.1 and ULC S705.2:
 - .1 Closed Cell Composition: Nominal 95% to ASTM D6226.
 - .2 Density: Nominal 35 to 45 kg/m³ to ASTM D1622.
 - .3 Compressive Strength: Nominal 210 kPa to ASTM D1621.

2.4 PANELS

- .1 Insulated metal panels consisting of roll formed steel face and liner sheets chemically fused to a foamed in place rigid polyisocyanurate expanded foam core and as follows:

- .1 Panel Width: 610 mm.
 - .2 Panel Thickness: 150 mm.
 - .3 Exterior Sheet: Shadowline profile.
 - .4 Interior Sheet: Shadowline profile.
 - .5 Joint Reveal: 3 mm
 - .6 Finish: Prefinished materials coated to film thickness as recommended by coating manufacturer, and designed specifically for vertical surfaces to 30° from vertical, and horizontal surfaces 5° up to 60° from horizontal and in accordance with ASTM A755/A755M and as follows:
 - .1 Interior Finish: Imperial White
 - .2 Exterior Finish: Imperial White
 - .7 Basis-of-Design Materials:
 - .1 Kingspan QuadCore KS Series
- .2 Insulated Metal Panels (Wash Bay Area): Roll formed steel face and stainless steel coated liner sheet chemically fused to a foamed in place rigid polyisocyanurate expanded foam core and as follows:
- .1 Panel Width: 1067 mm.
 - .2 Panel Thickness: 150 mm.
 - .3 Exterior Sheet: Shadowline profile
 - .4 Interior Sheet: Type 304 stainless steel.
 - .5 Exterior Finish: Prefinished materials coated to film thickness as recommended by coating manufacturer, and designed specifically for vertical surfaces to 30° from vertical, and horizontal surfaces 5° up to 60° from horizontal and in accordance with ASTM A755/A755M, Imperial White colour.
 - .6 Basis-of-Design Materials:
 - .1 Kingspan QuadCore KS Series with CLEANsafe 304 coating.
- .3 Wall Panels (behind exterior cladding): Insulated metal panels consisting of roll formed steel face and liner sheets chemically fused to a foamed in place rigid polyisocyanurate expanded foam core and as follows:
- .1 Panel Width: 610 mm.
 - .2 Panel Thickness: as indicated on drawings.
 - .3 Exterior Sheet: Shadowline profile
 - .4 Interior Sheet: Shadowline profile
 - .5 Joint Reveal: 3 mm.
 - .6 Finish: Prefinished materials coated to film thickness as recommended by coating manufacturer, and designed specifically for vertical surfaces to 30° from vertical, and horizontal surfaces 5° up to 60° from horizontal and in accordance with ASTM A755 and as follows:
 - .1 Finish: Selected from manufacturer's standard range.
 - .7 Basis-of-Design Materials:
 - .1 KarrierPanel, Kingspan Insulated Panels Ltd.

2.5 FABRICATION

- .1 Fabricate panels to thickness required by insulation value indicated on Drawings.
- .2 Fabricate panels from roll formed steel face and liner sheets chemically fused to a foamed in place rigid polyurethane expanded foam core as a single piece construction full height or stacked in multiple courses to suit design requirements for Work of the Contract.
- .3 Fabricate longitudinal edges of panel with roll formed male and female interlocking geometry fully supported by foamed in place insulation core with insulation core moulded into tongue and groove joint to allow positive insulation-to-insulation contact between panels to provide continuous thermal enclosure.

2.6 ACCESSORIES

- .1 Accessories: Manufacturer's standard materials as required for a complete and functional installation including, but not limited to, the following:
 - .1 Flashings, Enclosures and Trims: Matching colour and thickness of exterior sheet, coordinate requirements with Section 07 62 00 - Sheet Metal Flashing and Trim.
 - .2 Closure Channels: provide fibreglass closure channels as indicated on Drawings.
 - .3 Fasteners: Concealed type; in joint hex or pan headed fasteners.
 - .4 Washers: Concealed type; weather tight.
 - .5 Liquid Sealants: Non-curing, pressure resistant type; for use within internal panel joints, coordinate requirements with Section 07 92 00 - Sealants.
 - .6 Preformed Sealants: Preformed silicone sheets; for use in transition joints between wall panels and adjacent construction, coordinate requirements with Section 07 92 00 - Sealants.
 - .7 Intumescent Sealant: provide sealant in accordance with building code requirements to manufacturers recommendations for fire rated panels.
 - .8 Sealing Tape: Pressure-sensitive, 100 percent solids, polyisobutylene compound sealing tape with release paper backing. Provide permanently elastic, nonsag, nontoxic, nonstaining tape.

Part 3 Execution

3.1 EXAMINATION

- .1 Verification of Conditions: Verify that support structures are aligned and tolerances are within requirements provided during preconstruction meeting; starting work of this Section denotes acceptance of conditions.

3.2 INSTALLATION

- .1 Prior to installation, inspect structure to ensure all walls and openings are within ± 3 mm of location shown on drawings. Structure to be plumb within 1:1000 of

overall height. Installation is not to proceed until the building is within these tolerances.

- .2 Support system shall be attached to the structural as required to transmit design loads.
- .3 Framing and other components shall be straight to match plane of panel as required to meet the installed panel tolerances with straight, sharply formed edges.
- .4 After their correct position has been determined and allowances for expansion, building movement, uniform joint width and alignment of all parts has been determined, the components shall be permanently fastened.
- .5 Place panel fasteners through pre-punched holes in attachments clips, concealed within the joint of the panel. Secure units to the structural supports. Space clips as recommended by Manufacturer or as indicated on reviewed shop drawings.
- .6 Installed panels shall not deviate from overall plane or alignment by more than five percent greater than their dimensioned width at any location along their full length and shall not be wavy, out of line or of different width from panel to panel.
- .7 Install flashings to divert all moisture and condensation to exterior. Trim and flash around doors, louvers, and windows.
- .8 Install pre-formed corners and end enclosures, sealed to avoid direct weather penetration.
- .9 Insulate voids and provide continuous air seal at joints and openings.
- .10 Provide weatherproof escutcheons for pipe and conduit penetrating exterior walls.
- .11 Confirm panels are aligned vertically and horizontally.
- .12 Apply continuous butyl sealant at intersections between wall panels and dissimilar materials.
- .13 Control Joints
 - .1 Construct control joints as indicated, using cover sheets or brake formed profiles of same material and finish as adjacent material, mechanically fastened.
 - .2 Assemble and secure wall system to metal frame so stresses on sealants are within manufacturers' recommended limits.

3.3 FIELD QUALITY CONTROL

- .1 Have manufacturer of products supplied under this Section review Work involved in handling, installation/application, protection and cleaning of its products, and submit written reports in acceptable format to verify compliance of Work with Contract.
- .2 Manufacturer's field services: Provide manufacturer's field services consisting of product use recommendations and periodic site visits for inspection of product installation in accordance with manufacturer's instructions.
- .3 Schedule site visits to review Work at stages listed:

- .1 After delivery and storage of products, and when preparatory Work on which Work of this Section depends is complete, but before installation begins.
- .2 Twice during progress of Work at 25% and 60% complete.
- .3 Upon completion of Work, after cleaning is carried out.
- .4 Submit reports to Consultant within three days of review.

3.4 CLEANING

- .1 Cleaning: Strip protective films, clean surfaces and remove any substances such as metal fillings caused by drilling that could cause discolouration of staining; remove excess materials, debris and equipment.

END OF SECTION

Part 1 General

1.1 SUMMARY

- .1 Section Includes:
 - .1 Cedar siding and soffits, accessories including trims, closures, cap pieces, fasteners, sealants and insect screens.
- .2 Related Requirements:
 - .1 Section 06 10 00 – Rough Carpentry
 - .2 Section 07 21 13 – Board Insulation
 - .3 Section 07 27 19 – Sheet Membrane Air and Vapour Barrier
 - .4 Section 07 62 00 – Sheet Metal Flashing and Trim
 - .5 Section 07 92 00 – Sealants
 - .6 Section 09 21 16 – Gypsum Board Assemblies
 - .7 Section 09 91 00 – Painting

1.3 ADMINISTRATIVE REQUIREMENTS

- .1 Pre-installation Meetings:

- .1 Convene pre-installation meeting one week prior to beginning work of this Section, with Contractor, Owner, installer, manufacturer's representative in accordance with Section 01 31 19 – Project Meetings to:
 - .1 Verify project requirements.
 - .2 Review structural load limitations.
 - .3 Co-ordination with other building subtrades.
 - .4 Review manufacturer's installation instructions.

1.4 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Submit product data in accordance with Section 01 33 00 – Submittal Procedures.
 - .1 Submit manufacturer's printed product literature, specifications and data sheet.
- .2 Submit samples in accordance with Section 01 33 00 – Submittal Procedures.
 - .1 Submit duplicate siding and soffit in specified width, 600 mm long, in dry condition.
- .3 Manufacturer's Instructions: Provide to indicate special handling criteria and installation sequence.
- .4 LEED Submittals: provide LEED submittals in accordance with Section 01 61 01 – LEED Product Requirements.

1.5 CLOSEOUT SUBMITTALS

- .1 Submit closeout data in accordance with Section 01 78 00 – Closeout Submittals.
 - .1 Provide manufacturer's printed recommendations for general maintenance, including cleaning instructions.

1.6 QUALITY ASSURANCE

- .1 Test Reports: certified test reports showing compliance with specified performance characteristics and physical properties.
- .2 Certificates: product certificates signed by manufacturer certifying materials comply with specified performance characteristics and criteria and physical requirements.
- .3 Mock-ups:
 - .1 Construct mock-ups in accordance with Section 01 45 00 - Quality Control.
 - .2 Construct typical exterior wall panel, 3 m long by 4 m wide, incorporating window openings with frame and sill installed, cladding, insulation, building corner condition, junction with roof system; illustrating materials interface and seals.
 - .3 Locate where directed.
 - .4 Mock-up may remain as part of Work.
 - .5 Allow 48 hours for review of mock-up by Consultant before proceeding with work.

1.7 DELIVERY, STORAGE, AND HANDLING

- .1 Deliver, handle, store and protect materials in accordance with manufacturer's instructions.
- .2 Store materials in safe area, away from construction traffic; store under cover and off ground, protected from moisture.
- .3 Packaging Waste Management
 - .1 Separate and recycle waste materials in accordance with Section 01 74 19 – Construction Waste Management.

Part 2 Products

2.1 CEDAR SIDING AND SOFFIT

- .1 Western Red Cedar: Graded to meet NLGA Grading Standards Rules, paragraph 200 and WRCLA.
 - .1 Grade: "A" clear or better.
 - .2 Surface: surfaced to sides (S4S).
 - .3 Texture: smooth.
 - .4 Edge: square
 - .5 Moisture Content: kiln dried to less than 15% moisture content, confirm moisture content and provide testing results to Consultant prior to application.
 - .6 Size (Nominal): 38 mm x 64 mm x longest practical length at 73.5 mm o.c..
 - .7 Fasteners: concealed stainless steel
 - .8 Finish: Exterior to be factory finished and an additional finish coat applied on site to provide a uniform finish. Interior to be factory primed and finished on site. Finish in accordance with Section 09 91 00 - Painting.

2.2 ACCESSORIES

- .1 Manufacturer's standard exposed trim, closures, cap pieces and other accessories required for complete installation.
- .2 Wood Strapping: as indicated in Section 06 10 00 – Rough Carpentry.
- .3 Breathable Weather Barrier Membrane: as indicated in Section 07 27 19 - Sheet Membrane Air and Vapour Barrier.
- .4 Girts: Fabricated from minimum 1.27 mm thickness galvanized steel to ASTM A653/A653M, Grade 230 with Z275 coating. Material visible after assembly of wall panel shall be finished to match aluminum panels.
- .5 Sub-girts: Structural quality steel to ASTM A653/A653M, with Z275 zinc coating, adjustable double-angle profile as indicated to accept panel with structural attachment to building frame.
- .6 Fasteners: nails to ASTM F1667/F1667M, No. 316 stainless steel, sized as required, splitless siding nail type with flat head, length sufficient to penetrate solid wood minimum 32 mm.

- .7 Sealants: as indicated in Section 07 92 00 - Sealants.
- .8 Insect Screen:
 - .1 In accordance with CAN/CGSB 79.1.
 - .2 Stainless Steel Wire: Type 304, 18 x 16 mesh (1.13 mm x 1.3 mm) using nominal 0.28 mm wire diameter; having minimum 66.08% apparent opening size, using non-magnetic stainless steel wire.
 - .3 Clips: low conductivity fibreglass attachments clips for assemblies with concrete structure.

Part 3 Execution

3.1 INSTALLATION

- .1 Compliance: comply with manufacturer's written data, including product technical bulletins, product catalogue installation instructions, product carton installation instructions, and data sheets.
- .2 Select siding boards of longest possible lengths. Discard boards that are warped, twisted, bowed, crooked or otherwise defective.
- .3 Install sill flashings, wood starter strips, inside corner flashings, edgings and flashings over openings.
- .4 Fasten wood siding in straight, aligned lengths to furring.
- .5 Seal cut surfaces. Apply touch up coats as required.
- .6 Provide weatherproof escutcheons for pipe and conduit penetrating exterior walls.
- .7 Space cedar slats equally in any given span.
- .8 Visually inspect siding, caulking, flashing annually for overall condition. Re-apply caulking and coating as necessary. Adjust flashing as required.

3.2 FIELD QUALITY CONTROL

- .1 Have manufacturer of products supplied under this Section review Work involved in handling, installation/application, protection and cleaning of its products, and submit written reports in acceptable format to verify compliance of Work with Contract.
- .2 Manufacturer's field services: Provide manufacturer's field services consisting of product use recommendations and periodic site visits for inspection of product installation in accordance with manufacturer's instructions.
- .3 Schedule site visits to review Work at stages listed:
 - .1 After delivery and storage of products, and when preparatory Work on which Work of this Section depends is complete, but before installation begins.
 - .2 Twice during progress of Work at 25% and 60% complete.
 - .3 Upon completion of Work, after cleaning is carried out.
- .4 Submit reports to Consultant within three days of review.

3.3 CLEANING

- .1 Upon completion of installation, remove surplus materials, rubbish, tools and equipment barriers.
- .2 The use of pressure washers is not recommended.

3.4 MAINTENANCE

- .1 Explain proper maintenance procedures to Owner at project closeout.

 - .2 CAN/ULC S114-05, Standard Method of Test for Determination of Non-Combustibility in Building Materials

1.3 ADMINISTRATIVE REQUIREMENTS

- .1 Sequencing: Coordinate installation with flashings and other adjoining construction to ensure proper sequencing.

1.4 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Submit product data in accordance with Section 01 33 00 - Submittal Procedures:
 - .1 Submit manufacturer's printed product literature, specifications and datasheet and include:
 - .1 Preparation instructions and recommendations.
 - .2 Installation instructions.
- .2 Submit shop drawings in accordance with Section 01 33 00 - Submittal Procedures:

- .1 Provide shop drawings indicating attachment methods, joinery, sealing methods and compliance with design criteria and requirements of related work.
- .3 Submit samples in accordance with Section 01 33 00 - Submittal Procedures:
 - .1 Submit duplicate 150 mm long samples of wall system in each type, colour, texture and pattern required. Include clips, caps, battens, fasteners, closures and other exposed accessories.

1.5 QUALITY ASSURANCE

- .1 Installer Qualifications: Engage experienced installer with a minimum of three (3) years experience who has completed systems similar in material, design, and extent to that indicated for Project and with record of successful performance.
- .2 Mock-Up: Provide a mock-up for evaluation of surface preparation techniques and application workmanship of the following details:
 - .1 Sill and head connections at windows and penetrations
 - .2 Joint between panels
 - .3 Detailing of corner caps and flashings.
 - .4 Do not proceed with remaining Work until mock-up has been reviewed by Consultant
 - .5 Refinish mock-up area as required to produce acceptable Work; at no additional cost to the Owner

1.6 DELIVERY, STORAGE AND HANDLING

- .1 Store products in manufacturer's unopened packaging until ready for installation.
- .2 Store siding flat on a smooth level surface. Protect edges and corners from chipping. Store sheets under cover and keep dry prior to installing.

1.7 WASTE MANAGEMENT AND DISPOSAL

- .1 Separate waste materials for recycling in accordance with authority having jurisdiction.

1.8 ENVIRONMENTAL REQUIREMENTS

- .1 Maintain environmental conditions (temperature, humidity, and ventilation) within limits recommended by manufacturer for optimum results. Do not install products under environmental conditions outside manufacturer's absolute limits.
- .2 Proceed with siding installation when substrate is completely dry.

1.9 WARRANTY

- .1 Manufacturer's Warranty: Submit manufacturer's standard warranty that panels are free from defects in materials and workmanship beginning from the date of substantial completion and as follows:
 - .1 Product Warranty: manufacturers standard limited, non prorated product warranty for a period of 25 years.
 - .2 Finish Warranty: 15 years: Deterioration of finish includes, but is not limited to, chipping, cracking, and peeling.

Part 2 Products

2.1 PERFORMANCE / DESIGN CRITERIA

- .1 Design composite building panel wall to provide for thermal movement of component materials caused by ambient temperature range of 80 degrees C without causing buckling, failure of joint seals, undue stress on fasteners or other detrimental effects.
- .2 Include expansion joints to accommodate movement in wall system and between wall system and building structure, caused by structural movements, without permanent distortion, damage to infills, racking of joints, breakage of seals, or water penetration.
- .3 Design members to withstand dead load and wind loads calculated in accordance with current Building Code and applicable local regulations, to maximum allowable deflection of 1/180th of span.
- .4 Provide for positive drainage of condensation occurring within wall construction and water entering at joints, to exterior face of wall in accordance with NRC "Rain Screen Principles".
- .5 Design wall system to accommodate specified erection tolerances of structure.
- .6 Maintain following installation tolerances:
 - .1 Maximum variation from plane or location shown on drawings: 3 mm/m of length and up to 20 mm/100 m maximum.
 - .2 Maximum offset from true alignment between two adjacent members abutting end to end, in line: 0.75 mm.

2.2 MATERIALS

- .1 Wood Plastic Composite (WPC) stain, scratch, fade and mould resistant shell composed of 95% recycled materials including reclaimed wood and fibre, PE polymer and additives, 360 degrees capped.

2.3 SIDING MATERIALS

- .1 Composite Wood Cladding:
 - .1 Profile: UH61
 - .2 Thickness: 25 mm.
 - .3 Width: 196 mm
 - .4 Colour: Australian Red Cedar.
 - .5 Factory Finish: Manufacturers standard factory applied finish.
 - .6 Acceptable Materials:
 - .1 Norwegian Fluted Siding, NewtechWood

2.4 ACCESSORIES

- .1 Subgirts: Rolled, Z-shaped, Z-275 galvanized steel girts to suit design loads and application.
- .2 Rigid Insulation: refer to Section 07 21 13 – Board Insulation

- .3 Wood strapping: pressure treated wood strapping in accordance with Section 06 10 00 – Rough Carpentry and as detailed on Drawings; to accept exterior sheet with structural attachment to building frame. Exposed materials of wall assembly to match panels.
- .4 Hat Sections and Other Sub framing: Rolled shapes, Z-275 galvanized steel to suit design loads and application.
- .5 Siding Accessories: Provide starter strips, edge trim, corner cap, and other items as recommended by siding manufacturer for building configuration, and as follows:
 - .1 Provide accessories made from same material as adjacent siding, unless otherwise indicated.
 - .2 Provide accessories matching colour and texture of adjacent siding, unless otherwise indicated.
- .6 Flashing: Provide pre-finished, galvanized sheet steel flashing and trims in accordance with Section 07 62 00, at window and door heads and where indicated.
- .7 Gaskets: Manufacturer's standard type suitable for use with system, permanently resilient; ultraviolet and ozone resistant; colour as directed.
- .8 Elastomeric Joint Sealant: single component polyurethane sealant joint sealant in accordance with Section 07 92 00.
- .9 Fasteners: Corrosion resistant fasteners as recommended by siding manufacturer for materials being fastened to and as follows:
 - .1 Fastening to Wood: Ribbed, bugle head screws of sufficient length to penetrate a minimum of 25 mm into substrate.
- .10 Touch Up Kit: Provide manufacturers standard touch-up kit for each colour provided.
- .11 Insect Screen:
 - .1 In accordance with CAN/CGSB 79.1.
 - .2 Stainless Steel Wire: Type 304, 18 x 16 mesh (1.13 mm x 1.3 mm) using nominal 0.28 mm wire diameter; having minimum 66.08% apparent opening size, using non-magnetic stainless steel wire.

Part 3 Execution

3.1 MANUFACTURER'S INSTRUCTIONS

- .1 Compliance: comply with manufacturer's written data, including product technical bulletins, product catalogue installation instructions, product carton installation instructions, and data sheets.

3.2 PREPARATION

- .1 Building surfaces shall be smooth, clean and dry, and free from defects detrimental to the installation of the system. Notify Contractor of conditions not acceptable for installation of system.

- .2 Proceed with installation only after unsatisfactory conditions have been corrected.
- .3 Ensure air/vapour barrier installation is complete and has been reviewed by the Consultant.

3.3 INSTALLATION: VERTICAL SIDING

- .1 Install materials in strict accordance with manufacturer's installation instructions.
- .2 Starting: Install a starter strip at the side course of the wall. Apply planks vertically locking clip at the top of each board and leaving min 19 mm space at the floor.
- .3 Allow minimum clearance between the edge of siding and any other material in strict accordance with the manufacturer's installation instructions.
- .4 Maintain clearance between siding and adjacent finished grade.
- .5 Use one single length of lap siding board to span an entire section of wall/between windows and doors, when possible. Minimize the number of butt joints.
 - .1 Locate splices at least one stud cavity away from window and door openings.
 - .2 Locate splices at least 305 mm away from window and door openings.
- .6 Specific framing and fastener requirements: refer to the applicable Building Code compliance reports.

3.4 INSTALLATION: TRIM AND MOULDING

- .1 Install materials in strict accordance with manufacturer's installation instructions. Install flashing around all wall openings.
- .2 Fasten through trim into structural framing or code complying sheathing. Fasteners must penetrate minimum 25 mm plus full thickness of sheathing. Additional fasteners may be required to ensure adequate security.
- .3 Place fasteners no closer than 19 mm and no further than 51 mm from side edge of trim board and no closer than 25 mm from end. Fasten maximum 406 mm on center.
- .4 Maintain clearance between trim and adjacent finished grade.
- .5 Trim inside corner with single board.
- .6 Outside Corner Board: Attach trim on both sides of corner with 16 gauge corrosion resistant finish nail 13 mm from edge spaced 406 mm apart, weather cut each end spaced minimum 305 mm apart.
- .7 Allow 3 mm gap between trim and siding.
- .8 Shim frieze board as required to align with corner trim.
- .9 Site paint exposed cut edges to match colour of board, trim, or plank.

3.5 CLEANING

- .1 Remove damaged, improperly installed, or otherwise defective siding materials and replace with new materials complying with specified requirements.

- .2 Clean finished surfaces according to siding manufacturer's written instructions and maintain in a clean condition during construction.

END OF SECTION

Part 1 General

1.1 SUMMARY

- .1 Section Includes:
 - .1 Materials and installation for insulated modified bituminous roofing system over steel deck as follows:
 - .1 Deck sheathing
 - .2 Vapour retarder
 - .3 Insulation and insulation overlay
 - .4 Adhesive applied base sheet
 - .5 Adhesive applied cap sheet
 - .2 Products supplied for Work of this section must be from a single manufacturer and compatible with adjacent products.
- .2 Related Requirements:
 - .1 Section 03 30 00 – Cast-in-Place Concrete
 - .2 Section 05 31 00 – Steel Decking
 - .3 Section 06 10 00 – Rough Carpentry
 - .4 Section 07 21 13 – Board Insulation
 - .5 Section 07 27 19 – Sheet Membrane Air and Vapour Barrier
 - .6 Section 07 62 00 – Sheet Metal Flashing and Trim
 - .7 Section 07 92 00 – Sealants
 - .8 Division 22 – Plumbing: Coordination of pipes and pipe fittings and other materials penetrating roof membranes.
 - .9 Division 23 – Heating, Ventilation and Air Conditioning: Coordination of ductwork and other materials penetrating roof membranes.
 - .10 Division 26 – Electrical: Coordination conduit, wiring, communications cabling, cable trays and other materials penetrating roof membranes.

1.3 ADMINISTRATIVE REQUIREMENTS

- .1 Convene pre-installation meeting one week prior to beginning work of this Section, with Contractor, Consultant, OIRCA representative, installer, manufacturer's representative in accordance with Section 01 31 19 – Project Meetings to:
 - .1 Verify project requirements.
 - .2 Review installation and substrate conditions.
 - .3 Co-ordination with other building subtrades.
 - .4 Review manufacturer's installation instructions and warranty requirements.

- .5 Notify the Consultant prior to bid closing if anything in the specification or the drawings does not meet OIRCA or manufacturer's warranty requirements.
- .6 Review OIRCA warranty certificate requirements.

1.4 ACTION SUBMITTALS / INFORMATION SUBMITTALS

- .1 Submit product data in accordance with Section 01 33 00 – Submittal Procedures:
 - .1 Provide copies of most recent technical roofing components data sheets describing materials' physical properties and include product characteristics, performance criteria, physical size, finish and limitations.
 - .2 Provide copies of Workplace Hazardous Materials Information System WHMIS SDS and indicate VOC content for:
 - .1 Primers.
 - .2 Vapour retarder membrane.
 - .3 Sealers.
 - .4 Insulation.
 - .5 Base and cap sheet.
- .2 Submit shop drawings in accordance with Section 01 33 00 – Submittal Procedures:
 - .1 Indicate flashing, control joints, tapered insulation details, slope, minimum and maximum thicknesses, board size, layout, and numbering and elevation datums at low and high points.
 - .2 Provide installation details for parapets, curbs, and roof penetrations.
 - .3 Provide layout for tapered insulation.
- .3 Manufacturer's Certificate: certify that products meet or exceed specified requirements.
- .4 Test and Evaluation Reports: submit laboratory test reports certifying compliance of bitumens, roofing felts, and membrane with specification requirements.
- .5 Manufacturer's field report: in accordance with Section 01 45 00 – Quality Control.
- .6 Reports: indicate procedures followed, ambient temperatures and wind velocity during application.
- .7 Manufacturer's Installation Instructions: indicate special precautions required for seaming the membrane.
- .8 Declaration of Materials Compatibility: submit written declaration stating that materials are compatible with the membrane and substrates and adjacent air/vapour barrier membrane, and are acceptable to the membrane manufacturer. Include a list of materials, suppliers, and manufacturers.
- .9 LEED Submittals: provide LEED submittals in accordance with Section 01 61 01 – LEED Product Requirements.

1.5 QUALITY ASSURANCE

- .1 Single-Source Responsibility: obtain roofing membrane materials from a single manufacturer regularly engaged in the manufacturing and supply of the specified products and meeting or exceeding the material properties and performance characteristics of the materials and manufacturers named in this Section and to meet the warranty requirements.
- .2 Installer Qualifications: company or person specializing in application of modified bituminous roofing systems with five years documented experience approved by manufacturer.
- .3 Roofing and sheet metal work shall be performed in conformance with roofing manufacturer's written recommendations using materials in accordance with CAN/ULC S107.
- .4 Perform Work to OIRCA practice Manual and manufacturers written instructions.
- .5 Work shall be executed by an applicator approved by the OIRCA as a member in good standing at time of application.
- .6 Inspection: Roofing system to be inspected throughout the installation by an OIRCA accepted independent Inspector.
- .7 Provide only materials listed by OIRCA.

1.6 DELIVERY, STORAGE, AND HANDLING

- .1 Deliver, store and handle materials in accordance with manufacturer's written instructions and Section 01 61 01 – LEED Product Requirements.
- .2 Storage and Handling Requirements:
 - .1 Safety: comply with requirements of Workplace Hazardous Materials Information System (WHMIS) regarding use, handling, storage, and disposal of asphalt, sealing compounds, primers and caulking materials.
 - .2 Provide and maintain dry, off-ground weatherproof storage.
 - .3 Store rolls of felt and membrane in upright position. Store membrane rolls with selvage edge up.
 - .4 Remove only in quantities required for same day use.
 - .5 Place plywood runways over completed Work to enable movement of material and other traffic.
 - .6 Store sealants at +5 degrees C minimum.
 - .7 Store insulation protected from weather, daylight and deleterious materials.
 - .8 Do not store materials on roof in concentrations that exceed design live load.
- .3 Packaging Waste Management
 - .1 Separate and recycle waste materials in accordance with Section 01 74 19 – Construction Waste Management.

1.7 SITE CONDITIONS

- .1 Ambient Conditions:

- .1 Do not perform roofing work when air temperature, including wind chill, falls below the membrane manufacturer's recommended limit.
- .2 Do not apply roofing materials to a damp, frozen or unsuitable surface.
- .3 Do not expose roofing materials vulnerable to water or sun damage in quantities greater than can be weatherproofed during the same day.
- .4 Ensure wood has a moisture content less than 19% prior to encapsulating with impermeable membrane.
- .2 Fire Protection:
 - .1 Comply with safety measures described in manufacturer's written installation requirements, requirements of insurance companies and other requirements of the Authorities Having Jurisdiction.
 - .2 Fire Extinguishers, located within six meters of each roofing torch, ULC labelled for ABC protection.
 - .3 At the end of each workday, use a heat detector gun to spot any smouldering or concealed hot spots. Job planning must be organized to ensure workers are still on location at least one hour after torch application.
 - .4 Do not apply torch directly to dry or unprotected wood surfaces.

1.8 WARRANTY

- .1 The Contractor shall provide a Roofing Warranty certificate with a five year Roofing Warranty Period, signed by both the Contractor and the Warrantor stating:
 - .1 The Roofing System has been constructed in accordance with the Contract Documents;
 - .2 The Roofing Warranty Period;
 - .3 Moisture leaks to be corrected within a time-frame determined by the Owner.
 - .4 The Owner as the warrantee, and stating that roofing work will remain in place and be free of any defects in materials and workmanship for the stated Roofing Warranty Period; and either:
 - .1 If a five (5) year Roofing Warranty Period is required: Warrantor shall, at no additional expense to the Owner, repair any roofing failures (of the Roofing System including: moisture penetration, installation errors, manufacturers defects) which includes the replacement of all affected components of the Roofing System, occurring between the date of Substantial Performance of the Work and the end of the Roofing Warranty Period.
- .2 Roofing Membrane Manufacturer: Provide manufacturer's warranty stating that they will repair or replace defective roofing (including labour) and base flashing materials that do not remain watertight, that splits, tears, or separates at the seams or from the substrate within the specified warranty period and as follows:
 - .1 Warranty Period: 10 years Warranty, starting from Substantial Performance for the Project.

- .2 Name of Warrantee: Warrantor shall issue a written and signed warranty identifying the owner's name as the warrantee, and stating that executed work will remain in place and be free of any defects in materials and workmanship for the stated warranty period.

1.9 THIRD PARTY ROOFING INSPECTION

- .1 The Contractor will engage third party roofing inspection. The Inspector will provide numerous inspections and reports to the Owner during the progress of the roofing work, in accordance with the OIRCA Roofing Applications Standards, to help ensure the roofing work is provided as set out in this Contract. Upon notice from the Owner, the Contractor shall expediently perform all steps and make changes as identified by the roofing inspector, at no cost to the Owner. The involvement of the roofing inspector does not relieve the Contractor of the responsibility to supervise, inspect and provide the roofing work as set out in this Contract.
- .2 The Construction schedule shall include roofing inspections. The Owner will provide the number of roofing inspections and the frequency. The Owner, Consultant, roofing inspector(s), and Roofing System manufacturer, at reasonable times, shall have proper and safe access to the Work, including parts of the Work in preparation at locations other than the Place of the Work, for the purposes of observation, inspection and testing.
- .3 Provide copies of the manufacturer's site reports to the Owner, Consultant, and roofing inspector, prior to Substantial Performance of the Work.

Part 2 Products

2.1 MANUFACTURERS

- .1 Basis-of-Design: Materials and colours listed below form the Basis-of-Design materials for this project.
- .2 Acceptable Membrane Manufacturers: Subject to compliance with requirements specified in this section and as established by the Basis-of-Design materials, manufacturers offering similar products that may be incorporated into the Work include the following:
 - .1 Henry Company.
 - .2 IKO Industries Ltd.
 - .3 Siplast.
 - .4 Soprema.
- .3 Use only materials from one manufacturer.

2.2 PERFORMANCE / DESIGN CRITERIA

- .1 Provide system with products to achieve ten year manufacturers warranty certificate as indicated above.
- .2 Compatibility between components of roofing system is essential. Provide written declaration to Consultant stating that materials and components, as assembled in system, meet this requirement.

- .3 Roofing System: to CSA A123.21 for wind uplift resistance.
 - .1 Net factored wind uplift pressure 0.53kPa to 2.15kPa. Wind uplift diagram as indicated on Structural Drawings.
 - .2 Coordinate with roof system manufacturer; confirm results with Consultant prior to commencing Work.

2.3 DECK COVERING

- .1 Glass Mat Faced Roof Boards: to ASTM C1177 for manufacturing and ASTM D3273 for mould resistance, standard, mould resistant, thickness as indicated.
 - .1 Surface Burning Characteristics: In accordance with CAN/ULC S102.
 - .1 Flame Spread: 0.
 - .2 Smoke Developed: 0.
 - .2 Long Edges: Square.
 - .3 Location: Where indicated on Drawings.
 - .4 Acceptable Materials:
 - .1 GlasRoc Sheathing, CertainTeed.
 - .2 Securock Gypsum Fiber Roof Board, CGC.
 - .3 DensDeck, Georgia Pacific.
 - .4 Dexcell Glass Mat Roof Board, National Gypsum.
- .2 Sheathing board attachment to steel deck: Corrosion-resistant, self-tapping screws and plates, capable of meeting Performance Criteria specified.
 - .1 Minimum Fastener Properties:
 - .2 Nominal 8 mm diameter fastener with oversized head.
 - .3 Buttress Threads: 12 threads per inch.
 - .4 Pull-out value in 22 gauge Grade E steel deck: 4.2 kN.
 - .5 Typical Static Back-Out: 5.1 N-m.
 - .6 Length to be sufficient to penetrate steel deck by minimum recommended length.

2.4 ROUGH CARPENTRY

- .1 Blocking, nailers, and other carpentry: as indicated in Section 06 10 00 - Rough Carpentry.
- .2 Do not use pressure treated materials where membrane materials are to be adhered directly to wood Products.

2.5 PRIMER

- .1 Primer comprised of elastomeric bitumen, volatile solvents and adhesive enhancing additives as recommended by membrane roofing manufacturer to suit substrate and installation conditions.
 - .1 Acceptable Materials:
 - .1 Blueskin Adhesive – Henry Company.
 - .2 IKO SAM Adhesive.

- .3 TA-325, Siplast.
- .4 Elastocol Stick, Soprema.

2.6 AIR AND VAPOUR RETARDER

- .1 Premanufactured Self Adhesive Air/Vapour Barrier: Self-adhesive air/vapour barrier membrane composed of SBS modified bitumen with thermoplastic polymers and high density polyethylene film and as follows:
 - .1 Thickness: Minimum 0.8 mm.
 - .2 Cold Bending: -35°C.
 - .3 Static Puncture: 400 N.
 - .4 Membrane Breaking Strength (MPa): MD=75, XD=98.
 - .5 Water Vapour Permeance: 0.92 ng/Pa•s•m² to ASTM E96.
 - .6 Acceptable Materials:
 - .1 Vapor Bloc SA – Henry Company.
 - .2 MVP, IKO.
 - .3 Sopravap'R, Soprema.
 - .4 V-Force Vapor Barrier for Siplast System, Elevate (Formerly Firestone).
- .2 Vapour retarder continuity strip: SBS membrane with reinforcement, and elastomeric bitumen. Sanded upper surface; underside self-adhesive, compatible with wall and roof air/vapour retarder membranes as recommended by accepted membrane manufacturers below.
 - .1 Acceptable Materials:
 - .1 ModifiedPlus G100 Tack Sheet, Henry Company.
 - .2 Armourbond Flash Sand, IKO.
 - .3 Paradiene 20 SA, Siplast.
 - .4 Sopraflash Stick Duo, Soprema.

2.7 INSULATION

- .1 Primary Insulation: Closed-cell polyisocyanurate foam core laminated to heavy non-asphaltic glass fibre reinforced facers; 25 mm thickness of largest panels practical, having square edges, minimum LTTR RSI 0.92/25 mm; conforming to ASTM C1289 Type II, Class 1, Grade 3, ULC 704.1, Type III, Class 3, (20 psi) to a tolerance not exceeding 3 mm from nominal size in any dimension, and as follows:
 - .1 Third-party test reports from an accredited laboratory must be provided to verify the declared performance in cold temperatures.
 - .2 Acceptable Materials:
 - .1 Secureshield GC, Carlisle.
 - .2 ACFoam III, Atlas Roofing Corporation.
 - .3 H-Shield GC, Hunter.
 - .4 Therm III, IKO.
 - .5 E'NRGY 3, Johns Manville.

- .6 Paratherm, Siplast.
- .7 Sopra-ISO Plus, Soprema.
- .2 Insulation Mineral Wool Roof Insulation: mineral wool fiber insulation made from ballast rock and slag and with rigid impregnated with a bitumen upper layer and as follows:
 - .1 Acceptable Materials:
 - .1 Toprock® DD, Rockwool Inc.
 - .2 Soprarock DD Plus, Soprema.
 - .3 Sloped Insulation: Extruded-Polystyrene (XPS) Board Insulation: ASTM C578, with maximum flame-spread and smoke-developed indexes of 75 and 450, respectively, per ASTM E84.
 - .1 Rigid closed cell extruded polystyrene foam insulation.
 - .2 Comply with ASTM C 578-95, Type IV, density 1.6 lb/cu. ft. min. compressive resistance 210 kPa to ASTM D1621
 - .3 Thermal resistance: RSI-values of 0.88. at 40 °F and 75 °F respectively to ASTM C518.
 - .4 Water absorption: 0.7 to ASTM D2842)
 - .5 Surface Burning Characteristics ASTM C 578
 - .1 Flame spread 0.
 - .2 Smoke Developed 155.
 - .6 Basis-of-Design Materials:
 - .1 Sopra XPS 30, Soprema

2.8 MEMBRANE

- .1 Composite Cover Board and Base Sheet: Asphaltic-support board and factory applied base sheet:
 - .1 Description: SBS modified base sheet membrane and polyester reinforcement, factory applied to a semi-rigid asphaltic board. The top surface is covered with sand. The membrane side lap is 60% self-adhesive and 40% covered with a poly film that is heat sealed.
 - .1 Board size: 910 mm x 2440 mm x thickness as indicated on Drawings (minimum 5 mm).
 - .2 In conformance with: CGSB 37.56-M
 - .3 Properties:

	MD	XD
.1 Strain Energy (kJ/m)	9	7
.2 Breaking Strength (N/50 mm)	17	12.5
.3 Ultimate Elongation (%)	60	65
.4 Tear Resistance (N)	60	
.5 Static Puncture Resistance (N)	400	
.6 Dimensional Stability (%)	-0.4	0.3
.7 Plastic Flow (°C)	≥ 115	
.8 Cold Bending (at -30°C)	No Cracking	

- .9 Lap Joint Strength (kN/m) Pass > 4kN/m
- .2 Acceptable Materials:
 - .1 Protectoboard Base 180, IKO.
 - .2 Protectoboard with Paratech 180 TG, Siplast
 - .3 2-1 Soprasmart Board, Soprema.
- .2 Roof Cap Sheet: Roof waterproofing system comprised of reinforced, elastomeric bitumen cap sheet applied using manufacturer's recommended cold adhesive; base sheet having two surfaces sanded; cap sheet having bottom surface sanded and top surface is protected by coloured granules, and as follows:
 - .1 Prefabricated membrane to CSA A123.23.
 - .2 Reinforcement: Composite polyester and glass grid.
 - .3 Elastomeric Bitumen: Mix of bitumen and SBS polymer.
 - .4 Protection: Coloured granules – white.
 - .5 Acceptable Materials:
 - .1 MP-HD-Cap, IKO.
 - .2 Parafor 30, Siplast
 - .3 ColPly Traffic Cap 460, Soprema.
- .3 Membrane base sheet flashing (stripping):
 - .1 Primer: Manufacturer's recommended elastomeric bitumen or synthetic rubber blend, volatile solvents, adhesive enhancing additives and resins used to prime substrate to enhance the adhesion of self-adhesive membranes suitable for application temperatures.
 - .2 Roofing membrane with non-woven polyester reinforcement and glass grid and elastomeric bitumen. Top face covered with thermofusible plastic film, underside self-adhesive and protected by silicone release paper in accordance with CSA A123.23 type two, class C, grade one.
 - .3 Components:
 - .1 Reinforcement: Non-woven polyester and glass grid.
 - .2 Elastomeric bitumen: Mix of selected bitumen and SBS polymer.
 - .3 Mark top face with lines to ensure proper roll alignment.
 - .4 Characteristics:
 - .1 Cold bending at minimum -25°C: No cracking.
 - .2 Reinforcing weight: minimum 160 g/m².
 - .3 Membrane Thickness: minimum 2.5 mm.
 - .5 Acceptable Materials:
 - .1 G100 Tack Sheet, Henry.
 - .2 Armourbond Flash, IKO.
 - .3 Sopralply Flam Stick, Soprema,

2.9 ADHESIVE

- .1 Insulation Adhesive: Manufacturers standard adhesives specifically formulated for installation of plastic insulation to roofing materials:

- .1 Acceptable Materials:
 - .1 Insta-Foam Products Inc. Insta-Stik, Dow.
 - .2 880-333 – Henry Company.
 - .3 IKO Millennium.
 - .4 Parafast Insulation Adhesive by Siplast.
 - .5 Duotack Adhesive, Soprema.
- .2 Roofing Base Sheet Adhesive: manufacturers standard OIRCA approved products.
- .3 Sheathing Board Adhesive: Manufacturers standard adhesives specifically formulated for installation of sheathing to metal deck.
 - .1 Basis-of-Design Materials:
 - .1 830-05, Henry Company.
 - .2 IKO Millennium.
 - .3 Parafast Insulation Adhesive, Siplast.
 - .4 Duotack Adhesive, Soprema.

2.10 ACCESSORIES

- .1 Fasteners:
 - .1 Fasteners to Steel Decking: Cadmium-plated flat-headed, self-tapping screws, No. 14, of Type A or AB, in conformance with CSA B35.3.
- .2 Perimeter Fire Seal: SBS modified bitumen, minimum 60 gm/m² glass fleece reinforced, self adhering membrane having sanded top face, cut into strips minimum 150 mm wide x nominal 1.5 mm thick.
 - .1 Acceptable Materials:
 - .1 Modiflex Tapes, IKO.
 - .2 Sopraguard Tape, Soprema.
- .3 Walkways:
 - .1 Consisting of one additional ply of cap sheet membrane. Grey colour to be different from field membrane as selected by Consultant.
- .4 Flashing and sheet metal in accordance with section 07 62 00 – Sheet Metal Flashing and Trim.
- .5 Waterproofing Mastic: solvent-based mastic containing SBS modified bitumen, fibres and mineral fillers, used to seal around penetrations and extrusions.
 - .1 Compatibility: With air/vapour barrier membrane, substrate and insulation.
 - .2 Specific gravity at 20°C: 1.0 kg/l to 1.12 kg/l.
 - .3 Application Temperature: -10°C to +35°C.
 - .4 Solids by Weight: 70% to 83 %.
 - .5 Acceptable Materials:
 - .1 AquaBarrier Mastic, IKO
 - .2 Sopramastic, Soprema.

- .6 Expansion Joint Waterproofing Membrane: EPDM-based synthetic rubber flexible membrane as recommended by waterproofing system materials manufacturer.
 - .1 Acceptable Materials:
 - .1 Soprajoint Plus, Soprema.
 - .2 Situra Redline
 - .3 Or as recommended by membrane manufacturer.
- .7 Low Rise Foam Adhesive:
 - .1 Acceptable Materials:
 - .1 Millennium, IKO
 - .2 Duotack, Soprema.
- .8 Torches: Use only torches designed for torching roofing material and acceptable to manufacturer.
- .9 Waterproofing liquid flashing: two component PMMA liquid membrane with fleece fabric.
 - .1 Acceptable Materials:
 - .1 Pumadeq 31MV, Henry Company.
 - .2 Metateck, IKO
 - .3 Parapro Field/ Parapro Flashing, Siplast.
 - .4 RS 230 Field, Soprema Alsan with Alsan RS 230 Flash, Soprema.

2.11 PIPE SUPPORTS

- .1 Roof drain pans, vent stack covers and other roof penetration flashings: pre-manufactured, stainless steel construction, purpose-made to suit application and location, designed to tie-in to SBS modified membrane roofing systems.
 - .1 Basis-of-Design Materials:
 - .1 Materials as required (coordinate with electrical and mechanical Drawings), Thaler Metal Industries Ltd., include submittal of manufacturer's 20-year Warranty.
- .2 Premanufactured Pipe Supports: fabricated from 100% recycled content, with 2.7 mm thickness galvanized steel frame, 150 mm wide x 100 mm tall x length to suit installation; including fasteners, bridge components, and angled supports as required for a complete installation and having the following accessories:
 - .1 Pipe and Conduit Support: Galvanized pipe clamp sized to suit gas pipe in accordance with manufacturers instruction's.
 - .2 Multi-Pipe and Conduit Support: Galvanized pipe support system size and number to suit pipes being supported in accordance with manufacturer's instructions.
 - .3 Extendable Height Support: Galvanized steel pipe extensions to suit installation in accordance with manufacturer's instructions.
 - .4 Provide loose piece of cap sheet membrane under each support.
 - .5 Acceptable Materials:
 - .1 C-Port, Clearline Technologies.

- .2 Dura-Blok, Eaton
- .3 Quick Block Sleeper, Pipe-Ease Inc.

Part 3 Execution

3.1 EXAMINATION

- .1 Do examination, preparation and roofing Work in accordance with Roofing Manufacturer's Specification Manual and OIRCA Roofing Practices Manual.
- .2 Verification of Conditions:
 - .1 Inspect with Consultant deck conditions including parapets, construction joints, roof drains, plumbing vents and ventilation outlets to determine readiness to proceed. The start of roofing work will mean roofing conditions are acceptable for work completion.
- .3 Evaluation and Assessment:
 - .1 Prior to beginning of work ensure:
 - .1 Decks are firm, straight, smooth, dry, free of snow, ice or frost, and swept clean of dust and debris. Do not use calcium or salt for ice or snow removal.
 - .2 Curbs have been built.
 - .3 Roof drains have been installed at proper elevations relative to finished roof surface.
 - .4 Plywood and lumber nailer plates have been installed to deck, walls and parapets as indicated.

3.2 PREPARATION

- .1 The interface of the walls and roof assemblies to be fitted with durable rigid material sheet metal and plywood providing connection point for continuity of air barrier.
- .2 Assembly, component and material connections to be made in consideration of appropriate design loads.
- .3 Cover walls, walks, sloped roofs and adjacent work where materials hoisted or used. Roofing Contractor shall assume full responsibility for damage.
- .4 Use warning signs and barriers. Maintain in good order until completion of Work.
- .5 Clean off drips and smears of bituminous material immediately.
- .6 Dispose of rain water off roof and away from face of building until roof drains or hoppers installed and connected.
- .7 Repair or replace defaced or disfigured finishes caused by work of this section.
- .8 Fire Protection: Provide fire protection during installation.
 - .1 Comply with safety measures described in manufacturer's written installation requirements, requirements of insurance companies and other requirements of the Authorities Having Jurisdiction.

- .2 Fire Extinguishers, located within six meters of each roofing torch, ULC labelled for ABC protection.
- .3 At the end of each workday, use a heat detector gun to spot any smouldering or concealed hot spots. Job planning must be organized to ensure workers are still on location at least one hour after torch application.
- .4 Do not apply torch directly to dry or unprotected wood surfaces.

3.3 SHEATHING

- .1 Mechanically fasten sheathing where indicated on Drawings with manufacturer's written instructions.
- .2 Place with long axis of each sheet transverse to trusses, with end joints staggered and fully supported.

3.4 PRIMING DECK

- .1 Do priming in accordance with manufacturers written recommendations.
- .2 Apply deck primer to deck substrate at the rate recommended by manufacturer.
- .3 Surfaces to be primed must be free of rust, dust or any residue that may hinder adherence.
- .4 Cover primed surfaces with roofing membrane within time limits recommended by roofing membrane system manufacturer.

3.5 AIR AND VAPOUR RETARDER INSTALLATION

- .1 Install self adhering air/vapour barrier membrane by unrolling air/vapour barrier membrane onto substrate aligned with substrate materials starting at bottom of slope without removing silicone release sheet, and as follows:
 - .1 Peel back one end of silicone release sheet and adhere membrane to substrate; peel remaining release sheet at a 45° angle to avoid wrinkles in membrane.
 - .2 Cut roll and start again where membrane is not properly aligned to deck; re-align membrane and overlap end of misaligned piece by 150 mm.
 - .3 Overlap adjacent membranes by 75 mm; overlap end laps by 150 mm; stagger end laps by 300 mm; place thin sheet of metal under end lap of membrane to provide structural support to lapped membranes.
- .2 Overlap roof air/vapour barrier to wall air/vapour barrier using compatible continuity strip to provide continuity of building envelope.

3.6 GENERAL MEMBRANE INSTALLATION

- .1 At end of each day's work or when stoppage occurs due to inclement weather, provide protection for completed Work and materials out of storage.
- .2 Clean off drips and smears of bituminous material immediately.
- .3 Dispose of rain water off roof and away from face of building until roof drains or hoppers installed and connected.
- .4 Do not install roofing materials during rain or snowfall.

- .5 Provide fire protection during installation.
- .6 Metal connectors and decking shall be treated with rust proofing or galvanization.

3.7 INSULATION APPLICATION

- .1 Insulation: fully adhered, adhesive application:
 - .1 Adhere insulation to vapour barrier using manufacturer's recommended adhesive applied at a rate recommended by the manufacturer
 - .2 Place boards in parallel rows with ends staggered and minimum two layers with staggered joints, and in firm contact with one another.
 - .3 Cut end pieces to suit.
 - .4 Apply adhesive in continuous ribbons at 300 mm on centre.
- .2 Tapered insulation application:
 - .1 Adhere insulation using manufacturer's recommended adhesive applied at rate recommended by manufacturer; adhere insulation at locations where roof deck will be visible in final installation.
 - .2 Install tapered insulation in accordance with shop drawings. Stagger joints between layers 150 mm minimum.
- .3 Overlay Board: adhesive application (roof slopes more than 6% slope):
 - .1 Adhere overlay board to insulation with adhesive at the rate recommended by manufacturers written instruction.
 - .2 Place boards with long joints continuous, and short joints staggered. Ensure boards are evenly and tightly butted together, with joints offset from primary insulation joints.
 - .3 Cut ends to suit and apply adhesive in continuous ribbons at 300 mm on centre.
 - .4 Apply only as many boards as can be covered with roofing membrane the same day.

3.8 (EXPOSED) CONVENTIONAL MEMBRANE ROOFING (CMR) APPLICATION

- .1 Base sheet application - adhered:
 - .1 Install membrane base sheet in full bed of adhesive applied at rate recommended by roofing membrane manufacturer using a notched 5 mm neoprene squeegee starting at drain and perpendicular to slope.
 - .2 Apply base sheet in parallel strips, lapping side joints 100 mm and end joints 150 mm; stagger end joints a minimum of 300 mm.
 - .3 Roll surface installed membrane using a 30 kg steel roller to smooth membrane and to provide continuous and uniform adhesion to insulation.
 - .4 Seal lap joints of base sheet at end each workday; perform work without interruption to avoid tears and formation of fish mouths, air pockets or wrinkles.
 - .5 Cut off corners at end laps being covered by next roll.
 - .6 Terminate base sheet at top of cant or at perimeter.
- .2 Perimeter Fire Seal Application

- .1 Apply perimeter fire seal to roof perimeter and curb substrates prior to applying base sheet materials. Apply fire seal to vertical joints in parapet or curb sheathing, and at vertical corners.
- .2 Extend fire seal minimum 50 mm up parapet faces and extend fire seal minimum 75 mm onto adjacent substrates. Ensure air bubbles and fish mouths are removed.
- .3 Install perimeter fire seal to act as temporary moisture seal until installation of flashing materials.
- .3 Reinforced gusset installation:
 - .1 Install gussets at every angle, and on inside and outside corners.
 - .2 Install self adhesive gussets before installing self adhesive base sheet flashing membranes.
- .4 Base sheet flashing installation:
 - .1 Apply base sheet flashing when primer coat is dry and in accordance with manufacturer's written instructions.
 - .2 Position pre-cut membrane pieces; peel back 100 mm to 150 mm of silicone release paper to hold the membrane in place at the top of the parapet, then gradually peel back remaining silicone release paper, pressing down on the membrane with aluminium applicator to provide good adhesion and to provide smooth transition between up-stand and field surface; smooth entire membrane surface with a roller for full adhesion.
 - .3 Cut off corners at end laps being covered by next roll.
 - .4 Install a reinforcing gusset in all inside and outside corners.
 - .5 Seal overlaps at the end of each workday.
- .5 Cap sheet application – adhered:
 - .1 Install cap sheet in a full bed of adhesive applied at a rate recommended by membrane manufacturer using notched 5 mm neoprene squeegee starting at drains and perpendicular to the slope; use brush grade or trowel grade adhesive as required for different membrane installation requirements as recommended by manufacturer's written installation requirements.
 - .2 Lap side joints 100 mm and end joints 150 mm; stagger end joints and joints between membranes plies a minimum of 300 mm; stagger base and cap sheet membranes by 300mm.
 - .3 Brush surface to provide complete and uniform adhesion immediately after placement of membrane into adhesive.
 - .4 Cut off corners at end laps being covered by next roll.
 - .5 Provide a smooth application, free of wrinkles, fish mouths, air pockets or tears.
 - .6 Terminate cap sheet at top of cant or at perimeter.
- .6 Cap Sheet Flashings Application:

- .1 Install cap sheet flashing in 1 m widths. Overlap side by 100 mm. Stagger base and cap sheet overlaps by minimum 100 mm. Make overlaps 150 mm wide.
- .2 Draw parallel chalk line 150 mm from parapet or upstand bases. Sink surface granules into bed of hot bitumen with torch from chalk line to parapet or upstand.
- .3 Adhere cap sheet to base sheet membrane starting from bottom and working to top using trowel grade adhesive applied with 5 mm notched steel trowel at a rate recommended by membrane manufacturer; use roller to apply even pressure over entire surface to provide uniform adhesion across entire surface.
- .7 Roof penetrations:
 - .1 Install roof drain pans, vent stack covers and other roof penetration flashings and seal to membrane in accordance with manufacturer's recommendations and details.

3.9 WALKWAYS

- .1 Install walkway membrane in accordance with the manufacturer's printed installation instructions to provide walkway access from roof access points to rooftop units and other mechanical elements requiring maintenance service.

3.10 DRAINS

- .1 Ensure all leaders are properly secured before proceeding with work.
- .2 Install drains and seals in accordance with the manufacturer's printed instructions.
- .3 Make openings water and vapour tight at membrane.
- .4 Install strainer and drain cover as per details.

3.11 ELECTRICAL CONDUIT FLASHING

- .1 At all electric conduit locations, install conduit flashing per manufacturer's approved details.
- .2 Flash-in base with roof membrane per manufacturer's approved detail.
- .3 Coordinate with electrical sub-contractor for disconnection and reconnection of wiring within a two hour limited timeframe.

3.12 GAS LINES AND CONDUIT

- .1 Install preformed plastic gas line supports.
- .2 Install supports at 2440 mm o.c. maximum, and at all directional changes in accordance with reviewed shop drawings. In addition if the gas lines are 19 mm or less the maximum space for supports are 1220 mm.
- .3 Install support at maximum of 305 mm from all connections in the gas lines.
- .4 Where preformed plastic supports are not suitable install specified precast concrete pavers, complete with pedestals on top of membrane.

- .5 On top of concrete pavers re-install existing wood blocking. Replace damaged missing with specified wood blocking to required height.
- .6 Secure gas line and conduit with clamping ring.
- .7 Ensure that piping is not damaged during roofing work and cleanup. Make good any damages caused.

3.13 FIELD QUALITY CONTROL

- .1 Inspection and testing of roofing application to be carried out by OIRCA accepted testing laboratory designated by Owner in cooperation with Consultant.
- .2 Inspection fees to be paid by Owner, in accordance with Section 01 45 00 – Quality Control.
- .3 Flood Testing:
 - .1 Do not conceal waterproofing until inspection and testing are completed to satisfaction of Consultant.
 - .2 Temporarily plug drains and dam horizontal surface areas to be tested and flood with water to minimum depth of 80 mm.
 - .3 Maintain flooded depth for 24 hours.
 - .4 If leaks occur repair and retest.
 - .5 Remove water at end of test.
- .4 Manufacturers' Field Services:
 - .1 Have manufacturer of products supplied under this Section review Work involved in handling, installation/application, protection and cleaning of its products, and submit written reports in acceptable format to verify compliance of Work with Contract.
 - .2 Manufacturer's field services: provide manufacturer's field services consisting of product use recommendations and periodic site visits for inspection of product installation in accordance with manufacturer's instructions.
 - .3 Schedule site visits to review Work at stages listed:
 - .1 After delivery and storage of products, and when preparatory Work on which Work of this Section depends is complete, but before installation begins.
 - .2 Twice during progress of Work at 25% and 60% complete.
 - .3 Upon completion of Work, after cleaning is carried out.
 - .4 Obtain reports within three days of review and submit.

3.14 CLEANING

- .1 Clean off drips and smears of bituminous material immediately.
- .2 Remove bituminous markings from finished surfaces.

Contract Number: RFTC-1868-24-TR88179

- .3 In areas where finished surfaces are soiled caused by work of this section, consult manufacturer of surfaces for cleaning advice and complying with their documented instructions.

3.15 PROTECTION

- .1 Protect roof from traffic and damage. Comply with precautions deemed necessary by Consultant.

END OF SECTION

Part 1 General

1.1 SUMMARY

- .1 Section Includes:
 - .1 Sheet metal materials.
 - .2 Prefinished steel sheet.
 - .3 Ice and water shield membrane.
 - .4 Insulation.
 - .5 Vapour retarder.
 - .6 Accessories: Underlay, ventilation and drainage mat, slip sheet, snap cap, sealant, cleats, fasteners, washers, flashing, roof curbs, and trim.
- .2 Related Sections:
 - .1 Section 01 35 00 – Delegated Design
 - .2 Section 06 10 00 – Rough Carpentry
 - .3 Section 07 21 13 – Board Insulation
 - .4 Section 07 42 13 – Preformed Metal Cladding
 - .5 Section 07 42 43 – Insulated Wall Panels
 - .6 Section 07 62 00 – Sheet Metal Flashing and Trim
 - .7 Section 07 92 00 - Sealants

1.3 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Submit product data in accordance with Section 01 33 00 – Submittal Procedures:
 - .1 Submit Workplace Hazardous Materials Information System WHMIS SDS - Safety Data Sheets in accordance with WHMIS acceptable to Labour Canada, and Health and Welfare Canada.
 - .2 Submit product data sheets for roofing felts and insulation. Include:
 - .1 Product characteristics.
 - .2 Performance criteria.
 - .3 Limitations.
- .2 Submit shop drawings in accordance with Section 01 33 00 – Submittal Procedures:

- .1 Indicate arrangements of sheets and joints, types and locations of fasteners and special shapes and relationship of panels to structural frame.
- .2 Shop drawings to detail continuity of air, vapour and thermal barriers at changes in plane, at transitions between assemblies, and at penetrations.
- .3 Submit samples in accordance with Section 01 33 00 – Submittal Procedures:
 - .1 Submit duplicate 300 x 300 mm samples of each sheet metal material.
- .4 Submit proof of manufacturer's CCMC Listing and listing number to Consultant.
- .5 Manufacturer's Instructions: Provide to indicate special handling criteria, installation sequence and cleaning procedures.
- .6 LEED Submittals: provide LEED submittals in accordance with Section 01 61 01 – LEED Product Requirements.

1.4 QUALITY ASSURANCE

- .1 Installer Qualifications: Engage experienced installer with a minimum of five years experience who has completed systems similar in material, design, and extent to that indicated for Project and with record of successful performance. Installer to be a member of the Ontario Industrial Roofing Contractors Association (OIRCA).
- .2 Retain a professional engineer, registered in the province of the Work, to design fabrication and erection of the Work of this Section in accordance with applicable Building Code and Contract Documents requirements including, but not limited to, the following:
 - .1 Seal and signature to shop drawings and design submittals.
 - .2 Field review of installed components.
 - .3 Completion of Letters or Commitment and Compliance specified in Section 01 35 00 – Delegated Design.
- .3 Obtain each type of metal roofing system through one source from a single manufacturer.
- .4 Mock-Ups
 - .1 Submit mock-ups in accordance with Section 01 45 00 - Quality Control.
 - .2 Mock-up will be used:
 - .1 To judge workmanship, substrate preparation, operation of equipment and material application.
 - .3 Locate where directed.
 - .4 Allow 24 hours for inspection of mock-up by Consultant before proceeding with sheet metal flashing work.
 - .5 When accepted, mock-up will demonstrate minimum standard of quality required for this Work. Approved mock-up may remain as part of finished Work.

1.5 DELIVERY, STORAGE, AND HANDLING

- .1 Deliver and store materials in accordance with manufacturer's instructions.

- .2 Protect panels during transportation, unloading, storing, and erecting to prevent bending, warping, twisting, and surface damage.
- .3 Packaging Waste Management
 - .1 Separate and recycle waste materials in accordance with Section 01 74 19 – Construction Waste Management.

1.6 WARRANTY

- .1 Manufacturer's Warranty for Finishes: 20 years from date of Substantial Performance.

Part 2 Products

2.1 MANUFACTURERS

- .1 Acceptable Manufacturers: Subject to compliance with requirements specified in this Section and as established by the Basis-of-Design Materials, manufacturers offering products that may be incorporated into the Work include the following:
 - .1 Agway Metals Inc.
 - .2 Behlen Industries.
 - .3 Berridge Manufacturing Company.
 - .4 Garland Canada Inc.
 - .5 Vicwest Steel Inc.
 - .6 Westform Metals.

2.2 PERFORMANCE / DESIGN CRITERIA

- .1 General: The complete roof cladding system shall meet the following performance/design criteria and maintain its intended appearance, remain wind and watertight, allow for expansion and contraction of metal components and transmit loads to the supporting structural back-up.
- .2 The design, and erection of a complete metal roof system is the responsibility of this subcontractor and are based on the performance criteria specified. The method assembly, reinforcing and anchorage is schematic and shows general intent only. Location and methods of providing same shall be this subcontractor's responsibility who shall design the assembly, reinforcing and anchorage to suit specific conditions in an acceptable manner complying with the requirements specified herein.
- .3 Provide flashing as shown and required to make the system wind and watertight, and still allow for thermal movement.
- .4 All fastenings shall be concealed where possible. Where exposed in finished surfaces, screw heads shall be neat and symmetrical, made completely watertight and capable of allowing expansion and contraction of metal roof cladding. Exposed fasteners shall be color-matched to finished metal cladding or stainless steel and as scheduled.
- .5 Thermal Movements and Wind Loads: The metal wall and associated flashing systems shall be so designed and constructed as to provide for such expansion and contraction of component materials as will be caused by an ambient

temperature range of -40°C to +60°C without causing harmful buckling, failure of joint seals, undue stress on fasteners or other detrimental effects.

- .6 Provide and/or make allowances for free noiseless vertical and horizontal thermal and wind loading movement, due to the contraction and expansion of any and all component parts.
- .7 Assembly and erection procedures shall take into account the ambient temperature range and wind pressure at the time of installation.
- .8 The system shall provide clear internal paths of drainage in order to drain any trapped moisture to the exterior, discharging moisture in a manner avoiding staining of architectural finishes, collecting in puddles, formation of unsafe icicles and dripping onto pedestrians.
- .9 Fasten panel assembly to building structure in a manner, which transmits all loads to the main structure without exceeding the capacity of any fastener.

2.3 SHEET METAL MATERIALS

- .1 Zinc coated steel sheet: to ASTM A653/A653M, commercial quality (CS), with Z275 galvanized coating and as follows:
 - .1 Base Metal Thickness: 0.76 mm.
 - .2 Finish: prefinished as specified below.
 - .3 Profile: to match AR38, Agway Metals.
 - .1 Ribbed, shallow vee in direction of standing seam.
 - .2 Seam Profile: Standing Seam.

2.4 PREFINISHED STEEL SHEET

- .1 Prefinished steel with factory applied silicone modified polyester.
 - .1 Class: F1S.
 - .2 Colour: to match adjacent metal
 - .3 Specular gloss: 25-35 units +/-5 to ASTM D523 for matte finish.
 - .4 Coating thickness: dry film thickness not less than 0.9 mil to ASTM D4138.
 - .5 Resistance to accelerated weathering for chalk rating of eight, colour fade five units or less and erosion rate less than 20% to ASTM D2244 and ASTM D659.
- .2 Prefinished steel with factory applied polyvinylidene fluoride.
 - .1 Class: F1S.
 - .2 Colour: to match adjacent metal
 - .3 Specular gloss: 30 units +/-5 to ASTM D523.
 - .4 Coating thickness: not less than 22 micrometres.
 - .5 Resistance to accelerated weathering for chalk rating of eight, colour fade five units or less and erosion rate less than 20% to ASTM D822/D822M as follows:
 - .1 Outdoor exposure period 2500 hours.
 - .2 Humidity resistance exposure period 5000 hours.

- .3 Prefinished steel with factory applied polyvinyl chloride.
 - .1 Class: F1S.
 - .2 Colour: to match adjacent metal
 - .3 Specular gloss: 30 units +/-5 to ASTM D523.
 - .4 Coating thickness: not less than 200 micrometres.
 - .5 Resistance to accelerated weathering for chalk rating of eight, colour fade five units or less and erosion rate less than 20% to ASTM D822/D822M as follows:
 - .1 Outdoor exposure period 5000 hours.
 - .2 Humidity resistance exposure period 5000 hours.

2.5 ICE AND WATER SHIELD MEMBRANE

- .1 Waterproofing Underlayment: self adhering membrane for high temperature applications; rubberized asphalt will not flow up to temperatures as high as 116°C.
 - .1 Primer: as recommended by manufacturer.
 - .2 Acceptable Materials:
 - .1 Ice and Water Shield HT, Grace Construction Products.
 - .2 Stormshield, IKO.
 - .3 Jiffy Seal Ice & Water Guard HT, Protecto Wrap.
 - .4 LapLock PSU (HT), Roofnado
 - .5 Lastobond Shield HT, Soprema.

2.6 VAPOUR RETARDER

- .1 Self adhered vapour retarder: SBS rubberized asphalt membrane, self adhering vapour retarder, having a non-slip surface and UV resistant opaque surface.
 - .1 Acceptable Materials:
 - .1 Modified Vapour Protector, IKO.
 - .2 Sopravap'R, Soprema.
 - .3 Vapor-Bloc SA, Henry Company.

2.7 FABRICATION

- .1 Fabricate all components of the system in the factory, ready for field installation.
- .2 Provide roof sheet and all accessories in longest practicable length to minimize field lapping of joints.

2.8 ACCESSORIES

- .1 Provide components required for complete metal roofing system assembly including trim, copings, fasciae, corner units, ridge cap, ridge closures, clips, flashings, sealants, gaskets, fillers, closure strips, and similar items; match material and finish of metal roofing system.
- .2 Isolation coating: alkali resistant bituminous paint.
- .3 Plastic cement: to CAN/CGSB-37.5.

- .4 Underlay: No.15 perforated asphalt felt to CSA A123.3.
- .5 Ventilation: sandwich structure, open core with nonwoven filter or membrane.
- .6 Slip sheet: reinforced sisal paper or a heavy felt kraft paper.
- .7 Snap Cap:
 - .1 Provide 25 mm high snap caps for full length of the roof panel and retained by panel clips, fabricated from Z275 galvanized (zinc coated) sheet steel conforming to ASTM A653/A653M structural quality Grade 230 having a nominal core thickness 0.76 mm. Finish and colour to match roof sheet.
- .8 Sealant: Asbestos-free sealant, compatible with systems materials, recommended by system manufacturer and as indicated in Section 07 92 00 - Sealants.
- .9 Rubber-asphalt sealing compound: to CAN/CGSB-37.29.
- .10 Cleats: of same material, and temper as sheet metal, minimum 50 mm wide. Thickness same as sheet metal being secured.
- .11 Fasteners: concealed.
- .12 Washers: of same material as sheet metal, 1 mm thick with rubber packings.
- .13 Flashing, Roof Curbs, and Trim: Prefinished flashing materials to match roofing materials in accordance with Section 07 62 00 - Sheet Metal Flashing and Trim.
- .14 Touch-up paint: as recommended by sheet metal roofing manufacturer.

Part 3 Execution

3.1 EXAMINATION

- .1 Examine substrates to ensure proper attachment to framing.
- .2 Examine roof deck to verify deck is clean and smooth, free of depressions, waves or projections and within flatness tolerances required by metal roofing system manufacturer.
- .3 Verify roof opening, curbs, pipes, sleeves, ducts or vents through roof are solidly set, cant strips and reglets in place, and nailing strips located.
- .4 Verify deck is dry and free of snow or ice.

3.2 INSTALLATION

- .1 Install metal roofing system in accordance with manufacturer's written instruction.
- .2 Use concealed fastenings except where approved by Consultant before installation.
- .3 Provide underlay under sheet metal roofing. Secure in place and lap joints 100 mm minimum.
- .4 Apply slip sheet over asphalt felt underlay to prevent bonding between sheet metal and felt. Secure with minimum anchorage and lap joints 50 mm minimum in direction of waterflow.

- .5 Install sheet metal roof panels using cleats spaced at 300 mm on centre.
- .6 Secure cleats with two fasteners each and cover with cleat tabs.
- .7 Stagger transverse seams in adjacent panels.
- .8 Flash roof penetrations with material matching roof panels, and make watertight.
- .9 Form seams in direction of water-flow and make watertight.

3.3 STANDING SEAM ROOFING

- .1 Fold lower end of each pan under 20 mm.
 - .1 Slit fold 25 mm away from corner to form tab where pan turns up to make standing seam.
 - .2 Fold upper end of each pan over 50 mm.
 - .3 Hook 20 mm fold on lower end of upper pan into 50 mm fold on upper end of underlying pan.
- .2 Apply sheet metal roofing beginning at eaves. Loose lock pans to valley flashing and edge strips at eaves and gable rakes.
- .3 Finish standing seams 25 mm high on flat surfaces. Bend up one side edge 40 mm and other 45 mm.
 - .1 Make first fold 6 mm wide single fold and second fold 12 mm wide, providing locked portion of standing seam with 5 plies in thickness.
 - .2 Fold lower ends of seams at eaves over at 45 degrees angle.
 - .3 Terminate standing seams at ridge and hips by turning down in tapered fold.
- .4 Form valleys of sheets not exceeding 3 m in length. Lap joints 150 mm in direction of flow.
 - .1 Extend valley sheet minimum 150 mm under roofing sheets.
 - .2 At valley line, double fold valley and roofing sheets and secure with cleats spaced 450 mm on centre.

3.4 ACCESSORY INSTALLATION

- .1 Install accessories with positive anchorage to building and weather tight mounting and provide for thermal expansion. Coordinate installation with flashings and other components.
- .2 Install components required for a complete metal roofing system assembly including trim, copings, ridge closures, seam covers, flashings, sealants, gaskets, fillers, closure strips, and similar items.
- .3 Install flashing and trim in accordance with performance requirements, manufacturer's written installation instructions, and SMACNA recommendations; provide concealed fasteners where possible, and set units true to line and level; install work with laps, joints, and seams that will be permanently watertight and weather resistant.
- .4 Install exposed flashing and trim that is without excessive oil canning, buckling, and tool marks and that is true to line and levels indicated, with exposed edges

folded back to form hems. Install sheet metal flashing and trim to fit substrates and to result in waterproof and weather-resistant performance.

3.5 CLEANING

- .1 Remove temporary protective coverings and strippable films, if any, as metal roofing system are installed, unless otherwise indicated in manufacturer's written installation instructions.
- .2 Clean finished surfaces as recommended by metal roofing system manufacturer upon completion of metal roofing system installation; maintain in a clean condition during remainder of construction.
- .3 Replace metal roofing system components that become damaged or have deteriorated beyond successful repair by finish touch-up or similar minor repair procedures.
- .4 Remove all excess materials, debris and equipment at completion.
- .5 Clean all panels clean and free of all grime and dirt.

END OF SECTION

Part 1 General

1.1 SUMMARY

- .1 Section Includes:
 - .1 Metal flashings.
 - .2 Scuppers.
 - .3 Accessories: Isolation coating, roofing cement, underlay for metal flashing, metal accessories, sealants, fasteners, counter flashing wind restraint clips, washers, adhesives and insect screen.
- .2 Related Requirements:
 - .1 Section 06 10 00 – Rough Carpentry
 - .2 Section 07 27 13 – Modified Bituminous Air and Vapour Barrier
 - .3 Section 07 42 43 – Insulated Wall Panels
 - .4 Section 07 52 00 – Modified Bituminous Membrane Roofing
 - .5 Section 07 61 00 – Sheet Metal Roofing
 - .6 Section 07 92 00 – Sealants
 - .7 Section 08 11 13 – Steel Doors and Frames
 - .8 Section 08 11 16 – Aluminum Doors and Frames
 - .9 Section 08 44 13 – Glazed Aluminum Curtain Walls
 - .10 Section 08 50 13 – Aluminum Windows

1.3 ADMINISTRATIVE REQUIREMENTS

- .1 Coordination:
 - .1 Coordinate work of this Section with interfacing and adjoining Work for proper sequencing of each installation and to provide positive weather resistance, durability of the work, and protection of materials and finishes.

1.4 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Submit product data in accordance with Section 01 33 00 – Submittal Procedures:
- .2 Shop Drawings: Indicate material profile, jointing pattern, jointing details, fastening methods, flashings, terminations, and installation details.
- .3 Submit one sample, 300 x 300 mm in size, illustrating metal finish colour.
- .4 Submit manufacturer's printed product literature for sheet metal flashing systems materials, specifications and datasheet and include product characteristics, performance criteria, physical size, finish and limitations.
- .5 LEED Submittals: provide LEED submittals in accordance with Section 01 61 01 – LEED Product Requirements.

1.5 QUALITY ASSURANCE

- .1 Installer qualifications: Engage an experienced installer having a minimum of three years experience who has completed projects similar in material, design, and extent to that indicated for this Project and with a record of successful in-service performance.
- .2 Construct and install roof metal flashings in accordance with OIRCA Manual details and in accordance with the OIRCA Manual. If requirements conflict, this specification takes precedence over the manual.

1.6 DELIVERY, STORAGE, AND HANDLING

- .1 Stack pre-formed and pre-finished material in manner to prevent twisting bending and rubbing.
- .2 Provide protection for galvanized surfaces.
- .3 Prevent contact of dissimilar metals during storage and protect from acids, flux, and other corrosive materials and elements
- .4 Protect prefinished surfaces from scratches and from rust staining.
- .5 Packaging Waste Management
 - .1 Separate and recycle waste materials in accordance with Section 01 74 19 – Construction Waste Management.

1.7 WARRANTY

- .1 The same warranty provisions apply to flashings associated with roofing as to the roofing.
- .2 Provide the manufacturers standard warranty with the minimum coverage of 20 years for the paint finish against chalking, fading, peeling, checking, cracking, or colour change.
- .3 Provide Warranty for sheet metal flashing and trim to include in maintenance manuals as specified in Section 01 78 00 – Closeout Submittals

Part 2 Products

2.1 METAL FLASHINGS

- .1 Zinc coated galvanized steel sheet (pre-finished): Type A commercial quality to ASTM A653/A653M, with Z275 designation zinc coating.
 - .1 Class: F1S-Finished one side
 - .2 Thickness: minimum 0.61 mm base metal thickness.
 - .3 Factory Finish: silicone modified polyester
 - .1 Basis-of-Design Materials:
 - .1 WeatherXL, Valspar or Perspectra, Dofasco.
 - .4 Colour: As indicated on drawings.
- .2 Form flashings, copings and fascias to profiles indicated.

2.2 SCUPPERS

- .1 Form scuppers from 0.76 mm thick prefinished steel
- .2 Sizes and profiles as indicated.
- .3 Provide necessary fastenings.

2.3 FABRICATION

- .1 Fabricate sheet metal building flashings and trim in accordance with the recommendations of SMACNA's Architectural Sheet Metal Manual that apply to the design, dimensions, metal, and other characteristics as required.
- .2 Fabricate aluminum flashings and other sheet aluminum work in accordance with AAI-Aluminum Sheet Metal Work in Building Construction.
- .3 Form sections square, true and accurate to size, free from distortion and other defects detrimental to appearance or performance.
- .4 Apply isolation coating to metal surfaces to be embedded in concrete or mortar.
- .5 Make flashings of prefinished metal for cap flashings, for all flashings adjacent to roofing at roof edges and area dividers and where exposed to view from ground. Make flashings for other locations, of plain galvanized metal as follows:
 - .1 Use 0.45 mm metal core thickness except where otherwise indicated.
 - .2 Use 0.62 mm metal core thickness wherever a flat length exceeding 305 mm wide occurs.
 - .3 Use 0.80 mm metal core thickness for concealed fastening strips.
- .6 All straight run joints shall be flashed into a cap flashing receiver as indicated below.

- .7 Make joints to allow for thermal movement, space S-Lock joints at 2440 mm with metal clips or 1200 mm if no metal clips for maximum centres.
- .8 Form non-expansion, but movable, joints in metal to accommodate elastomeric sealant in accordance with SMACNA standards.
- .9 Make flashings for building into masonry and concrete so that joints can be lapped 100 mm or more.
- .10 Strengthen free edges of metal flashings by folding to form a 13 mm hem.
- .11 Make flashings to curbs, walls and parapets a minimum of 200 mm high, where possible.
- .12 Where curb-mounted roof penetrations are not required, provide flashing sleeves and collars for all pipes and conduit extending through the roof. Sleeves shall be soldered to a piece of sheet metal extending at least 150 mm onto the surrounding roof.
- .13 Make joints for corners and intersections with standing seams except where exposed of pre-finished metal when seams shall be flat locked.
- .14 All bends machine made; form sections square, true and accurate to size, free from distortion and other defects detrimental to appearance or performance.
- .15 Fabricate cleats and attachment devices from same material as sheet metal component being anchored or from compatible, non-corrosive metal recommended by sheet metal manufacturer, and as follows:
 - .1 Size as recommended by SMACNA manual or sheet metal manufacturer for application but not less than thickness of metal being secured.
- .16 Back paint metal flashings in contact with dissimilar metals or materials with bituminous paint that would result in electrolytic action or corrosion.

2.4 ACCESSORIES

- .1 Isolation coating: alkali resistant bituminous paint.
- .2 Roofing Cement: to ASTM D4586/D4586M, asphalt based, asbestos free.
- .3 Underlay for metal flashing: High temperature self adhered membrane.
 - .1 Basis of Design Material:
 - .1 Lastobond Shield HT, Soprema
- .4 Metal Accessories: Provide sheet metal clips, straps, anchoring devices, and similar accessory units as required for installation of Work, matching or

- compatible with material being installed; noncorrosive; size and thickness required for performance.
- .5 Sealants: as indicated in Section 07 92 00 - Sealants.
 - .6 Fasteners: of same material as sheet metal, to CSA B111, as recommended by sheet metal manufacturer; non-corrosive. Finish of exposed parts to match material being fastened.
 - .7 Counter Flashing Wind Restraint Clips: Provide clips being installed before counter flashing to prevent wind uplift of the counter flashing lower edge.
 - .8 Washers: of same material as sheet metal, 1 mm thick with rubber packings.
 - .9 Insect Screen:
 - .1 In accordance with CAN/CGSB 79.1.
 - .2 Stainless Steel Wire: Type 304, 18 x 16 mesh (1.13 mm x 1.3 mm) using nominal 0.28 mm wire diameter; having minimum 66.08% apparent opening size, using non-magnetic stainless steel wire.
 - .3 Clips: low conductivity fibreglass attachments clips for assemblies with concrete structure.
 - .10 Adhesives: Type recommended by flashing sheet metal manufacturer for waterproof and weather resistant seaming and adhesive application of flashing sheet metal.
 - .11 Touch-up paint: as recommended by prefinished material manufacturer.

Part 3 Execution

3.1 EXAMINATION

- .1 Check mounting and counterflashing of mechanical items and report any defect to the Consultant.
- .2 Verify that solid wood blocking or sheathing provided to back-up flashings, nails, screws set, and wood provides a smooth flat plane.

3.2 INSTALLATION GENERAL

- .1 Compliance: comply with manufacturer's written recommendations, including product technical bulletins, handling, storage and installation instructions, and datasheets.
- .2 Install sheet metal flashing and trim to withstand wind loads, structural movement, thermally induced movement, and exposure to weather without failing, rattling, leaking and fastener disengagement.
- .3 Install metal flashings on all surfaces such as roof cant edges, sleepers, parapets and cap type, wall junctions, roof dividers, curbs, roof control joints, through roof penetrations and the like, and as otherwise required to provide flashing type protection to details. Unless otherwise directed extend all flashings down as indicated on drawings. Additionally install counter and base flashings unless otherwise directed by the Consultant.
- .4 Sheet metal flashings are intended to protect the roof membrane from accelerated deteriorating effects of the elements, and to limit mechanical damage

- of the membrane, and are not intended to protect the work from direct migration of moisture. Ensure that the roofing system membrane terminations are fully water tight, without reliance on covering flashing.
- .5 Fasten and install roof edge flashing and copings capable of all resisting according to recommendations of FMG Loss Prevention Data Sheet 1-49, for wind conditions as outlined in the Ontario Building Code for the York Region.
 - .6 Provide sheet metal flashing and trim that allow for thermal movements resulting from the following maximum change (range) in ambient and surface temperatures by preventing buckling, opening of joints, hole elongation, overstressing of components, failure of joint sealants, failure of connections, and other detrimental effects:
 - .1 Provide clips that resist rotation and avoid shear stress as a result of sheet metal and trim thermal movements.
 - .2 Base engineering calculations on surface temperatures of materials due to both solar heat gain and nighttime sky heat loss.
 - .3 Temperature change (range): 67 degrees Celsius ambient; 100 degrees Celsius material surfaces.
 - .7 Provide sheet metal flashing and trim to create a rain screen assembly to the completed air/vapour and roofing membrane termination details.
 - .8 Install prefinished metal fascia to complete edge details. Install as separate piece from flashing.
 - .9 Call for inspection by roofing inspector, of completed roofing work prior to the installation of any metal flashings. Provide other flashing inspections, such as at start-up and periodic inspections, by the roofing inspector at frequencies required by OIRCA.
 - .10 Coordinate installation of flashing work of this Section with flashing work of other Sections which ties into this work. Coat surfaces of different metals such as aluminum and galvanized steel which are in contact to each other, with bituminous paint to prevent electrolysis.

3.3 INSTALLATION: METAL FLASHING

- .1 Apply metal roof flashing to OIRCA recommended requirements as a minimum.
- .2 Install sheet metal flashing and trim in accordance with performance requirements, manufacturer's installation instructions, and SMACNA's Architectural Sheet Metal Manual.
- .3 Do not install metal flashings over flexible roof flashing until the flexible roof flashing has been inspected and approved by the Roofing Inspector. This includes curbs for roof mounted items.
- .4 Fasten metal base flashing to walls or upstands along top of flashing. Do not secure to cant strip. Form lapped corner joints. Extend rolled edge of base flashing approximately 25 mm on to roof from toe of cant, and rest on top of roof surface.
- .5 Do not use exposed fastening unless indicated, or concealed fastening is not possible. Locations and methods shall be approved by Consultant.
- .6 Provide underlay under sheet metal.

- .1 Secure in place and lap joints 100 mm.
- .7 Counterflash bituminous flashings at intersections of roof with vertical surfaces and curbs.
 - .1 Flash joints using S-lock forming tight fit over hook strips, as detailed.
- .8 Lock end joints and caulk with sealant.
- .9 Insert metal flashing under cap flashing to form weather tight junction.
- .10 Separate metal from non-compatible metal or corrosive substrates by coating concealed surfaces, at locations of contact, with asphalt mastic or other permanent separation as recommended by manufacturer.
- .11 Underlayment: Install a slip sheet of red rosin paper and a course of polyethylene underlayment where installing stainless steel or aluminum directly on cementitious or wood substrates. Provide high-temp self adhered membrane at parapet flashing locations.
- .12 Bed flanges of Work in a thick coat of roofing cement where required for waterproof performance.
- .13 Turn top edge of flashing or mortar joint minimum of 25 mm. Lead wedge flashing securely into joint.
- .14 Caulk flashing at cap flashing with sealant.
- .15 Install wind clips as required for flashing.
- .16 Install drainage items fabricated from sheet metal, with straps, adhesives, and anchors recommended by SMACNA's Manual or the Item manufacturer, to drain roof in the most efficient manner.
- .17 Coordinate roof drain flashing installation with roof drainage system installation.
- .18 All exposed and pre-finished flashings to provide a smooth flat surface free of indentations, bumps, oil-canning, or twists, all edges, bends hard, sharp and true to line.

3.4 INSTALLATION: SCUPPERS

- .1 Install scuppers as indicated.

3.5 CLEANING

- .1 Proceed in accordance with Section 01 74 11 - Cleaning.
- .2 On completion and verification of performance of installation, remove surplus materials, excess materials, rubbish, tools and equipment.
- .3 Clean exposed metal surfaces, removing substances that might cause corrosion of metal or deterioration of finishes.
- .4 Leave work areas clean, free from grease, finger marks and stains.

3.6 PROTECTION

- .1 Provide final protection and maintain conditions that ensure sheet metal flashing and trim Work during construction is without damage or deterioration other than natural weathering at the time of Substantial Performance.

END OF SECTION

Part 1 General

1.1 SUMMARY

- .1 Section Includes:
 - .1 Thermally broken roof hatches with insulated double wall lids.
 - .2 Accessories: Hardware, screws, latch, gasket/seal, isolation coating, and safety railing system.
- .2 Related Requirements:
 - .1 Section 05 50 00 – Metal Fabrications
 - .2 Section 06 10 00 – Rough Carpentry
 - .3 Section 07 52 00 – Modified Bituminous Membrane Roofing
 - .4 Section 07 62 00 – Sheet Metal Flashing and Trim
 - .5 Section 07 92 00 – Sealants

1.2 REFERENCES

- .1 Reference Standards:

 - .3 Underwriters Laboratories ECOLOGO Certification Program (UL):
 - .1 UL 2761, Sealants and Caulking Compounds (formerly CCD-045).
 - .2 UL 2768 Architectural Surface Coatings. (formerly CCD-047).

1.3 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Submit product data in accordance with Section 01 33 00 – Submittal Procedures:

- .1 Submit manufacturer's printed product literature, specifications and technical data sheet.
- .2 Provide two copies of Workplace Hazardous Materials Information System WHMIS SDS - Safety Data Sheets in accordance with WHMIS acceptable to Labour Canada, and Health and Welfare Canada. Indicate VOC's for caulking materials during application and curing.
- .2 Submit shop drawings in accordance with Section 01 33 00 – Submittal Procedures:
 - .1 Indicate size and description of components, materials, attachment devices, detail continuity of air, vapour, and thermal barriers at changes in plane, at transitions, between assemblies, and at penetrations, description of frame and finish, and construction details.
- .3 Manufacturer's Instructions:
 - .1 Submit manufacturer's installation instructions.
- .4 LEED Submittals: provide LEED submittals in accordance with Section 01 61 01 – LEED Product Requirements.

1.4 CLOSEOUT SUBMITTALS

- .1 Provide maintenance data for hardware complete with pertinent details, spare parts lists and warnings against harmful maintenance materials and practices for incorporation into manual specified in 01 78 00 - Closeout Submittals.

1.5 DELIVERY, STORAGE, AND HANDLING

- .1 Packaging Waste Management
 - .1 Separate and recycle waste materials in accordance with Section 01 74 19 – Construction Waste Management.

1.6 SITE CONDITIONS

- .1 Verify related work of other trades is complete prior to installing roof hatch and coordinate installation with roof membrane and roof insulation.
- .2 Verify that an air seal has been properly installed prior to installation of roof hatch.

Part 2 Products

2.1 MANUFACTURERS

- .1 Acceptable Manufacturers: Subject to compliance with requirements specified in this Section, manufacturers offering products that may be incorporated into the Work include; but are not limited to, the following:
 - .1 Acudor Access Doors.
 - .2 Babcock-Davis Hatchways Inc.
 - .3 Bilco Canada.
 - .4 Cendrex.
 - .5 Lexcan Ltd.

- .6 Maxam Metal Products Ltd.
- .7 Nystrom Products Co.

2.2 PERFORMANCE/DESIGN CRITERIA

- .1 Roof hatches to withstand external load of 1.9 kPa and internal load of 0.95 kPa and temperature range of 80 degrees C without damage to unit or permanent deformation to seals.

2.3 ROOF HATCH

- .1 Provide thermally broken roof hatches with insulated double wall lids and insulated double wall curb frame with integral deck mounting flange and lid frame counter flashing with welded sealed corner joints, continuous weather tight perimeter gasketing and hot dip galvanized hardware, and as follows:
 - .1 Size: Single leaf lid, 750 mm x 2440 mm
 - .2 Curb and Lid Material: Galvanized steel sheet, nominal 2.0 mm minimum thickness, insulated sandwiched construction.
 - .3 Insulation: Polyisocyanurate insulation board, minimum 50 mm thickness.
 - .4 Exterior Curb Liner: Curb as detailed on Drawings.
 - .5 Hardware: zinc plated chromate sealed, counterbalanced spring latch with turn handles, butt or pintle type 316 stainless steel hinge system as standard for manufacturer, and padlock hasps inside and outside.
 - .6 Latching: Single point, using manufacturer's standard latching mechanism.
 - .7 Finish Colour: as directed by Consultant.
 - .8 Basis of Design Materials:
 - .1 L-50 TB, Bilco.

2.4 FABRICATION

- .1 Fabricate components free of twists, bends, or visual distortion and insulated. Weld corners and joints.
- .2 Assemble roof hatch components as indicated.
- .3 Ensure continuity of weather-tight seal.
- .4 Design flashings to collect and lead off accumulated condensation.
- .5 Zinc plate hardware and attachments and shop prime ready for field painting.

2.5 ACCESSORIES

- .1 Screws: stainless steel for curb to structure and for hatch lip frame to outer attachment.
- .2 Securing latch: hold open operating arm with vinyl grip handle to permit one-handed release.
- .3 Resilient gasket/seal to inner face of lid in contact with hatch lid support frame.
- .4 Isolation coating: alkali resistant bituminous paint or epoxy solution.

- .5 Safety Railing System: Manufacturer's standard safety rail system consisting of nominal 40 mm diameter rails, clamps, fasteners, safety barrier at railing opening, and all accessories required for a complete installation. Installed so that top of railing is 1070 mm above roof surface, finished with manufacturer's standard baked enamel finish, and as follows:
 - .1 Provide weep holes or another means to drain entrapped water in hollow sections of handrail and railing members.
 - .2 Fabricate joints exposed to weather in a watertight manner.
 - .3 Close exposed ends of handrail and railing members with prefabricated end fittings.

Part 3 Execution

3.1 INSTALLATION

- .1 Compliance: comply with manufacturer's written data, including product technical bulletins, product catalogue installation instructions, product carton installation instructions, and data sheets.
- .2 Erect components plumb, level and in proper alignment.
- .3 Ensure continuity of building envelope air barrier and vapour retarder systems.
- .4 Adjust and seal assembly with provision for expansion and contraction of components.
- .5 Secure prefabricated curb assembly to structure.
- .6 Coat aluminum and copper in contact with dissimilar materials, with isolation coating.
- .7 Secure and seal frame to curb.

END OF SECTION

Part 1 General

1.1 SUMMARY

- .1 Section Includes:
 - .1 Through penetration firestopping and smoke seal systems for penetrations through the following fire resistance rated assemblies, including both empty openings and openings containing penetrating items:
 - .1 Floors.
 - .2 Wall and partitions.
 - .3 Smoke barriers.
 - .4 Construction enclosing compartmentalized areas.
 - .2 Fire resistive joint systems for the following:
 - .1 Floor-to-floor joints.
 - .2 Floor-to-wall joints.
 - .3 Head-of-wall joints.
 - .4 Wall-to-wall joints.
 - .3 Requirements for Rated Systems or systems requiring Engineered Judgements (EJ):
 - .1 Use of materials that have not been tested in a system or that are not capable of obtaining an Engineered Judgement will not be acceptable for use on this Project.
 - .2 Materials having only a ULC, CUL or FM Approved label will not be acceptable for use on this Project, unless supporting documentation is provided indicating its use in a ULC and FM Approved Rated Assembly Listing for Firestop Systems and Components of an Engineered Judgement specific to the installation conditions of the project.
 - .4 Requirements for installation of Fire Stop systems under a single source of responsibility; either through direct supervision of the Contractor or a single trade responsibility performed by a specialty Subcontractor at the choice of the Contractor.
 - .5 Requirements for third-party verification of installed Fire Stop system components forming a part of the work of this Section by an inspection agency that employs personnel who are qualified to perform this work in accordance a recognized training program acceptable to the Consultant and Authority Having Jurisdiction.
- .2 Related Requirements:
 - .1 Section 01 35 00 – Delegated Design
 - .2 Section 09 21 16 – Gypsum Board Assemblies
 - .3 Division 21-23 Mechanical
 - .4 Division 26-28 Electrical

1.2 REFERENCES

- .1 Definitions:

- .1 Fire-Resistance Rating: The time in minutes or hours that a material or assembly of materials will withstand the passage of flame and transmission of heat when exposed to fire meeting the requirements of ULC 101 or as determined by formal testing of material or assembly of materials meeting requirements of ULC 115, or an interpretation of information derived from formal testing in accordance with requirements of the Building Code and acceptable to the Authority Having Jurisdiction.
 - .2 Fire Separation: Assembly that acts as a barrier against the spread of fire, smoke and noxious gases resulting from combustion as defined by the Building Code and includes the following assemblies having a Fire-Resistance Rating requiring Fire Stopping as follows:
 - .1 Penetration-Type Fire Stop systems located within load bearing walls and partitions.
 - .2 Penetration-Type Fire Stop systems located within non-load bearing walls and partitions.
 - .3 Penetration-Type located within floor assemblies.
 - .4 Building Perimeter-Type located between floor assemblies and exterior wall and roof construction.
 - .5 Construction Joint-Type and other assemblies having a Fire-Resistance Rating indicated on Drawings or Schedules.
 - .3 Fire Compartment: Spaces within a building that are enclosed by exterior walls or separated from other parts of the building by enclosing Fire Separations having a Fire-Resistance Rating.
 - .4 Firewall: Assembly that is a Fire Separation constructed from non-combustible construction subdividing a building or separating adjoining buildings to resist the spread of fire and that has a Fire-Resistance Rating, and structural stability to remain intact under fire conditions for the required fire-rated time.
 - .5 Fire Stop: System consisting of a material, component and means of support used to fill gaps between Fire Separations or between Fire Separations and other assemblies, or used around items that wholly or partially penetrate a Fire Separation.
- .2 Reference Standards:
- .1 American Society for Testing and Materials International (ASTM):
 - .1 ASTM A1008/A1008M-23e, Standard Specification for Steel, Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low-Alloy, High-Strength Low-Alloy with Improved Formability, Solution Hardened, and Bake Hardenable.
 - .2 ASTM E119-22, Standard Test Methods for Fire Tests of Building Construction and Materials.
 - .3 ASTM E814-23a), Standard Test Method for Fire Tests of Penetration Firestop Systems.
 - .4 ASTM E1966-15(2019), Standard Test Method for Fire-Resistive Joint Systems.
 - .5 ASTM E2174-20a, Standard Practice for On-Site Inspection of Installed Firestop Systems..

- .6 ASTM E2307-23b, Standard Test Method for Determining Fire Resistance of Perimeter Fire Barrier Systems Using Intermediate-Scale, Multi-story Test Apparatus.
- .7 ASTM E2393-20a, Standard Practice for On-Site Inspection of Installed Fire Resistive Joint Systems and Perimeter Fire Barriers.
- .2 Canada Green Building Council (CaGBC):
 - .1 LEED Canada V4 – Building Design and Construction (BD+C).
- .3 Factory Mutual (FM):
 - .1 FM Approval 4990, Firestopping. 2009.

 - .1 UL 1479-2015, Standard for Fire Test of Through-Penetration Firestops.
- .8 Underwriter's Laboratories of Canada (ULC):
 - .1 ULC Firestop Systems and Components, 2017 Edition.
 - .2 ULC 101, Standard Methods of Fire Endurance Tests of Building Construction and Materials. (CAN/ULC-S101-14)
 - .3 ULC 102, Standard Method of Test for Surface Burning Characteristics of Building Materials and Assemblies. (ULC S102)
 - .4 ULC 114, Standard Method of Test for Determination of Non-Combustibility in Building Materials.
 - .5 ULC 115, Standard Method of Fire Tests of Firestop Systems.

1.3 ADMINISTRATIVE REQUIREMENTS

- .1 Pre-Installation Meetings: convene pre-installation meeting one week prior to beginning work of this Section, with contractor's representative and Consultant in accordance with Section 01 31 19 – Project Meetings to:
 - .1 Verify project requirements.
 - .2 Review installation and substrate conditions.
 - .3 Co-ordination with other building subtrades.
 - .4 Review manufacturer's installation instructions and warranty requirements.

- .2 Schedule: Submit a schedule listing surfaces or components to which firestopping and smoke seals is to be applied, and indicating the firestopping and smoke seals system and materials required and detailing installation not later than 30 working days following Award of Contract.

1.4 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Provide submittals in accordance with Section 01 33 00 – Submittal Procedures.
- .2 Submit product data in accordance with Section 01 33 00 – Submittal Procedures:
 - .1 Submit manufacturer's printed product literature, specifications and datasheet and include product characteristics, performance criteria, physical size, finish and limitations.
 - .2 Provide electronic copy of Workplace Hazardous Materials Information System WHMIS SDS - Safety Data Sheets in accordance with WHMIS acceptable to Labour Canada, and Health and Welfare Canada.
- .3 Quality assurance submittals: submit following in accordance with Section 01 45 00 - Quality Control.
 - .1 Test reports: in accordance with ULC-101 for fire endurance and ULC-102 for surface burning characteristics and ULC 115.
 - .1 Submit certified test reports from approved independent testing laboratories, indicating compliance of applied fire stopping with specifications for specified performance characteristics and physical properties.
 - .2 Document from Engineer of Record showing compliance of alternative fire stopping solution with ULC 115 and the EJ guidelines provided by the National Research Council, *Best Practices Guide on Fire Stops and Fire Blocks and Their Impact on Sound Transmission*.
 - .2 Certificates: submit certificates signed by manufacturer certifying that materials comply with specified performance characteristics and physical properties.
 - .3 Manufacturer's Instructions: submit manufacturer's installation instructions and special handling criteria, installation sequence, and cleaning procedures.
 - .4 Manufacturer's Field Reports: submit to manufacturer's written reports within three days of review, verifying compliance of Work, as described in PART THREE - FIELD QUALITY CONTROL.
- .4 Provide a third party inspection agency upon completion of the Work of this Section to inspect the fire stopping work and submit written reports and verifications/approval of the installation of products and systems and the products are installed to the manufacturer's requirements to achieve the required fire ratings.
- .5 LEED Submittals: provide LEED submittals in accordance with Section 01 61 00 – LEED Product Requirements.

1.5 QUALITY ASSURANCE

- .1 Regulatory Requirements: Use materials and methods of determining required thickness of application that have the full acceptance of Authority Having Jurisdiction and that are tested in accordance with ULC 115, and that form a part of a ULC or CUL listed system, Engineered Judgement or Equivalent Fire Resistance Rated Assembly.
- .2 Use materials and methods of determining required thickness of application that have the full acceptance of authority having jurisdiction.
- .3 Qualifications: Installer: company or person specializing in fire stopping installations and approved by manufacturer with five years documented experience
- .4 Where possible determine thickness to be applied from tests of assemblies identical to the assembly to be protected, conducted in accordance with ULC 101, ASTM E119, UL 1479, NFPA 251, and ASTM E814.
- .5 Determine system from available engineering studies, or correspondence with the labelling agency indicating the effect of the differences on the fire separation of the assembly. Confirm acceptance of system by authorities having jurisdiction in writing.
- .6 Where the assembly includes conditions that do not correspond to those included in any previously tested assembly and for which no relevant engineering information is available use the same system and material as would be required for a tested assembly with similar conditions and that will achieve at least the minimum level of performance required in a previously tested assembly.
- .7 Use materials tested to ULC 115. Assemblies containing the materials shall be in accordance with assemblies tested and approved by agencies acceptable to authority having jurisdiction.
- .8 Source Responsibility: Obtain through penetration firestop and joint systems, for each kind of penetration and construction condition indicated, from a single source of installation responsibility.
- .9 Delegated Design Professional: Use a Professional Engineer, registered in the province of the Work and familiar with installations of similar scope and complexity to design firestopping and smoke seals.

1.6 DELIVERY, STORAGE, AND HANDLING

- .1 Packing, shipping, handling and unloading:
 - .1 Deliver, store and handle materials in accordance with Section 01 61 00 - Common Product Requirements.
 - .2 Deliver, store and handle materials in accordance with manufacturer's written instructions.
 - .3 Deliver materials to the site in undamaged condition and in original unopened containers, marked to indicate brand name, manufacturer, and ULC markings.
- .2 Storage and Protection:
 - .1 Store materials in dry location and in accordance with manufacturer's recommendations in clean, dry, well-ventilated area.

- .2 Replace defective or damaged materials with new.
- .3 Use stock before its expiration date.
- .3 Packaging Waste Management
 - .1 Separate and recycle waste materials in accordance with Section 01 74 21 - Waste Management and Disposal.

1.7 SITE CONDITIONS

- .1 Ambient Conditions:
 - .1 Install firestopping and smoke seals materials only when the areas in which they are scheduled are closed-in and protected from dampness.
 - .2 Install firestopping and smoke seals systems when ambient or substrate temperatures are within temperature and moisture limits permitted by firestopping and smoke seals system manufacturers or when substrates are not wet due to rain, frost, condensation, or other causes.
 - .3 Ventilate firestopping and smoke seals systems in accordance with manufacturer's written instructions by natural means or forced air circulation where natural means are not adequate.

Part 2 Products

2.1 MANUFACTURERS

- .1 Acceptable Manufacturers: Subject to compliance with requirements specified in this Section, manufacturers offering products that may be incorporated into the Work include; but are not limited to, the following:
 - .1 3M Canada Inc.
 - .2 Carboline (formerly A/D Fire Protection Systems Inc.)
 - .3 EZ-Path Fire Rated Pathways.
 - .4 Firestop Systems Inc.
 - .5 Hilti Canada Ltd.
 - .6 Johns Manville Fire Protection Systems.
 - .7 Nuco Self Seal Firestopping Products.
 - .8 Roxtec, Preformed Fire Stopping Systems.
 - .9 Specified Technologies Inc.
 - .10 Tremco Ltd.

2.2 PERFORMANCE/DESIGN CRITERIA

- .1 Delegated Design Requirements: Design firestopping and smoke seals required by the Contract Documents to withstand fire ratings indicated and in accordance with requirements of the Building Code, and as described in Section 01 35 00 – Delegated Design.
- .2 Performance Requirements: Manufacturer shall design proprietary assemblies to withstand the listed ratings in accordance with the Building Code, Underwriters Laboratories Canada, and authorities having jurisdiction, and as follows:

- .1 Provide through penetration firestop and joint systems that are produced and installed to resist spread of fire according to requirements indicated, resist passage of smoke and other gases, and maintain original fire resistance rating of assembly penetrated:
 - .1 Fire resistance rated load bearing walls, including partitions, with fire protection rated openings.
 - .2 Fire resistance rated non-load bearing walls, including partitions, with fire protection rated openings.
 - .3 Fire resistance rated floor assemblies.
- .2 F-Rated Systems: Provide through penetration firestop systems with F-ratings indicated, as determined by ULC 115 or ASTM E814, but not less than that equalling or exceeding fire resistance rating of constructions penetrated.
- .3 T-Rated Systems: For the following conditions, provide through penetration firestop systems with T-ratings indicated, as well as F-ratings, as determined per by ULC 115 or ASTM E814, where systems protect penetrating items exposed to potential contact with adjacent materials:
 - .1 Penetrations located outside wall cavities.
 - .2 Penetrations located outside fire resistive shaft enclosures.
 - .3 Penetrations located in construction containing fire protection rated openings.
 - .4 Penetrating items larger than 100 mm diameter nominal pipe or 100 cm² in overall cross sectional area.
- .4 Firestopping and Smoke seals Systems Exposed To View: Systems exposed to view, traffic, moisture, and physical damage; provide products that after curing do not deteriorate when exposed to these conditions both during and after construction, and as follows:
 - .1 Provide moisture resistant through penetration firestop systems for piping penetrations for plumbing and wet pipe sprinkler systems.
 - .2 Provide firestopping and smoke seals systems capable of supporting floor loads involved either by installing floor plates or by other means for floor penetrations with annular spaces exceeding 100 mm in width and exposed to possible loading and traffic.
 - .3 Provide firestopping and smoke seals systems not requiring removal of insulation for penetrations involving insulated piping.
 - .4 Provide products with flame spread ratings of less than 25 and smoke developed ratings of less than 50 for firestopping and smoke seals and joint systems exposed to view.
- .5 Fire Resistance of Joint Systems: Assembly ratings and movement capabilities indicated, but with assembly ratings not less than that equalling or exceeding fire resistance rating of constructions in which joints are located.

2.3

MATERIALS: FIRESTOPPING AND SMOKESEALS, GENERAL

- .1 Compatibility: Provide firestopping and smoke seals systems that are compatible with one another, with the substrates forming openings, and with the items, if

any, penetrating firestopping and smoke seals systems, under conditions of service and application, as demonstrated by firestopping and smoke seals system manufacturer based on testing and field experience, and as follows:

- .1 Service penetration assemblies: certified by ULC in accordance with ULC 115 and listed in ULC Guide No. 40 U19.
- .2 Service penetration firestopping and smoke seals components: certified by ULC in accordance with ULC 115 and listed in ULC Guide No. 40 U19.13, under the Label Service of ULC.
- .3 Fire resistance rating of installed firestopping and smoke seals assembly not less than the fire resistance rating of surrounding floor and wall assembly.
- .4 Firestopping and Smoke seals at openings intended for ease of re-entry such as cables: elastomeric seal; do not use cementitious or rigid seal at such locations.
- .5 Firestopping and Smoke seals at openings around penetrations for pipes, ductwork and other mechanical items requiring sound and vibration control: elastomeric seal; do not use a cementitious or rigid seal at such locations. Exemption to fire dampers.
- .2 Accessories: Provide components for each firestopping and smoke seals systems that are needed to install fill materials. Use only components specified by firestopping and smoke seals system manufacturer and approved by the qualified testing and inspecting agency for firestopping and smoke seals systems indicated. Accessories include, but are not limited to, the following items:
 - .1 Permanent forming, damming and backing materials, including the following:
 - .1 Slag or rock wool fibre insulation.
 - .2 Sealants used in combination with other forming, damming or backing materials to prevent leakage of fill materials in liquid state.
 - .3 Fire-rated form board.
 - .4 Fillers for sealants.
 - .2 Temporary forming materials.
 - .3 Substrate primers.
 - .4 Collars.
 - .5 Steel sleeves.
 - .6 Primers: to manufacturer's recommendation for specific material, substrate, and end use.
 - .7 Water (if applicable): potable, clean and free from injurious amounts of deleterious substances.
 - .8 Metal fire stop: Commercial galvanized steel, to ASTM A1008/A1008M, zinc coating 260 g/m², minimum metal core thickness 0.912 mm.
 - .9 Steel Deck Moulded Flute Inserts: One piece moulded mineral fibre flute inserts, sized for steel deck profiles, for placement at top of fire rated wall assemblies:
 - .1 Basis-of-Design Materials:
 - .1 Hilti CP777 Speed Plugs.
 - .10 Labels: Peel-and-stick labels printed with the following information:

- .1 ATTENTION: FIRE RATED ASSEMBLY. DO NOT MODIFY.
- .2 Name of firestopping manufacturer.
- .3 Names of products used.
- .4 Hour Rating of Assembly.
- .5 Manufacturers standard detail number, or Engineered Judgement identifier; ULC or cULUS Number.
- .6 Date of installation.
- .7 Name of installing Subcontractor.
- .8 Contact telephone number for repair or replacement of firestopping materials.

2.4 FILL MATERIALS

- .1 General:
 - .1 Provide firestopping and smoke seals systems containing the types of fill materials indicated in the Firestopping and Smoke seals System Schedule below by reference to the types of materials described in this Article. Fill materials are those referred to in directories of the referenced testing and inspecting agencies as fill, void, or cavity materials.
 - .2 Firestopping and smoke seal systems shall be tested in accordance with ULC 115, and be comprised of asbestos-free materials and systems capable of maintaining an effective barrier against flame, smoke and gases, and not to exceed opening sizes for which they are intended for the ratings as indicated on drawings.
- .2 Cast-in-Place Firestopping and Smoke seals Devices: Factory-assembled devices for use in cast-in-place concrete floors and consisting of an outer metallic sleeve lined with an intumescent strip, a radial extended flange attached to one end of the sleeve for fastening to concrete formwork, and a neoprene gasket.
- .3 Latex Sealants: Single-component latex formulations that after cure do not re-emulsify during exposure to moisture.
- .4 Firestopping and Smoke seals Devices: Factory-assembled collars formed from galvanized steel and lined with intumescent material sized to fit specific diameter of penetrating item.
- .5 Cable Penetration Devices:
 - .1 Pre-manufactured intumescent blocks.
 - .1 Acceptable Materials:
 - .1 CFS-BL Intumescent Blocks, Hilti.
 - .2 Intumescent Blocks, Roxtec.
 - .2 Pre-manufactured sleeves, consisting of an adjustable core.
 - .1 Acceptable Materials:
 - .1 CP 653 Speed Sleeves, Hilti.
 - .2 EZ-Path Fire Rated Pathway, Specified Technologies.
 - .3 Pre-manufactured cable management system, consisting of a system of intumescent inserts and adjustable cores
 - .1 Acceptable Materials:

- .1 Transit, Hilti.
 - .2 Preformed Fire Stopping Systems, Roxtec.
- .6 Intumescent Composite Sheets: Rigid panels consisting of aluminum foil faced elastomeric sheet bonded to galvanized steel sheet.
- .7 Intumescent Putties: Non-hardening dielectric, water resistant putties containing no solvents, inorganic fibres, or silicone compounds.
- .8 Intumescent Spray Foam: Expanding spray-in-place intumescent foam sealant.
- .9 Intumescent Wrap Strips: Single component intumescent elastomeric sheets with aluminum foil on one side.
- .10 Mortars: Pre-packaged, dry mixes consisting of a blend of inorganic binders, hydraulic cement, fillers, and lightweight aggregate formulated for mixing with water at Project site to form a non-shrinking, homogeneous mortar.
- .11 Pillows/Bags: Reusable, heat expanding pillows/bags consisting of glass fibre cloth cases filled with a combination of mineral fibre, water insoluble expansion agents and fire retardant additives.
- .12 Silicone Foams: Multi-component, silicone based liquid elastomers that, when mixed, expand and cure in place to produce a flexible, non-shrinking foam.
- .13 Silicone Sealants: Moisture curing, single component, silicone based, neutral curing elastomeric sealants of grade indicated below:
 - .1 Grade for Horizontal Surfaces: Pourable (self levelling) formulation for openings in floors and other horizontal surfaces.
 - .2 Grade for Vertical Surfaces: non-sag formulation for openings in vertical and other surfaces.

2.5 MIXING

- .1 For those products requiring mixing before application, comply with firestopping and smoke seals system manufacturer's written instructions for accurate proportioning of materials, water (if required), type of mixing equipment, selection of mixer speeds, mixing containers, mixing time, and other items or procedures needed to produce products of uniform quality with optimum performance characteristics for application indicated.

Part 3 Execution

3.1 EXAMINATION

- .1 Examine surfaces, components, materials to receive firestopping and smoke seals material; report any conditions which would detrimentally affect the application of the material or the proper firestopping and smoke seals of the system.
- .2 Commence Work when conditions of surfaces and the working conditions are suitable.
- .3 Where penetration sealants or caulking are required, ensure all service lines are in place, tested and approved.

- .4 Verify all proper blocking, framing (using non-combustible materials) are properly installed and prepared to receive firestopping and smoke seals. Notify Consultant in writing of any deficiencies affecting the proper performance of the firestopping and smoke seals, do not proceed until deficiencies are corrected.

3.2 PREPARATION

- .1 Examine sizes and conditions of voids to be filled to establish correct thicknesses and installation of materials.
 - .1 Ensure that substrates and surfaces are clean, dry and frost free.
- .2 Prepare surfaces in contact with fire stopping materials and smoke seals to manufacturer's instructions.
- .3 Maintain insulation around pipes and ducts penetrating fire separation without interruption to vapour barrier.
- .4 Prime surfaces as required.
- .5 Mask where necessary to avoid spillage and over coating onto adjoining surfaces; remove stains on adjacent surfaces.

3.3 INSTALLATION

- .1 Compliance: comply with manufacturer's written recommendations or specifications, including product technical bulletins, handling, storage and installation instructions, and datasheets.
- .2 Install fire stopping and smoke seal material and components in accordance with manufacturer's certified tested system listing.
- .3 Apply firestopping and smoke seals materials/systems to maintain the fire separations in the project as indicated on drawings.
- .4 Seal holes or voids made by through penetrations, poke-through termination devices, and unpenetrated openings or joints to ensure continuity and integrity of fire separation are maintained.
- .5 Provide temporary forming as required and remove forming only after materials have gained sufficient strength and after initial curing.
- .6 Tool or trowel exposed surfaces to neat finish.
- .7 Remove excess compound promptly as work progresses and upon completion.

3.4 FIELD QUALITY CONTROL

- .1 Review: notify Consultant when ready for review and prior to concealing or enclosing fire stopping materials and service penetration assemblies.
 - .1 Cut tests may be made at random by the Owner. Frequency of cut tests shall be determined by the Consultant, but will not be more than 1% of total length of firestopping and smoke seals.
 - .2 Make all necessary repairs and correct all deficiencies noted after completion of cut tests.
- .2 Manufacturer's Field Services:

- .1 Obtain written report from manufacturer verifying compliance of Work, in handling, installing, applying, protecting and cleaning of product and submit Manufacturer's Field Reports as described in Section 01 33 00 – Submittal Procedures.
- .2 Provide manufacturer's field services consisting of product use recommendations and periodic site visits for inspection of product installation in accordance with manufacturer's instructions.
- .3 Schedule site visits, to review Work, twice during progress of Work at 25% and 60% complete.

3.5 CLEANING

- .1 Proceed in accordance with Section 01 74 11 - Cleaning.
- .2 On completion and verification of performance of installation, remove surplus materials, excess materials, rubbish, tools and equipment.
- .3 Remove temporary dams after initial set of fire stopping and smoke seal materials.

3.6 SCHEDULE

- .1 Design and provide through penetration firestopping and smoke seals as follows for:
 - .1 Systems with No Penetrating Items: Select one or more of the following fill materials:
 - .1 Latex sealant.
 - .2 Silicone sealant.
 - .3 Intumescent putty.
 - .4 Intumescent foam blocks or boards.
 - .5 Intumescent spray foam.
 - .2 Systems for Metallic Pipes, Conduit, or Tubing: Select one or more of the following fill materials:
 - .1 Latex sealant.
 - .2 Silicone sealant.
 - .3 Intumescent putty.
 - .4 Intumescent foam blocks or boards.
 - .5 Intumescent spray foam.
 - .3 Systems for Non-metallic Pipe, Conduit, or Tubing: Select one or more of the following fill materials:
 - .1 Latex sealant.
 - .2 Silicone sealant.
 - .3 Intumescent putty.
 - .4 Intumescent wrap strips.
 - .5 Firestopping and Smoke seals device.
 - .6 Intumescent spray foam.
 - .4 Re-enterable and Cable Managed Systems for Electrical, and Data and Communications Cables:

- .1 Prefabricated Firestop Sleeve CP653 (Hilti).
- .2 Preformed Intumescent Blocks CFS-BL (Hilti).
- .3 Preformed Intumescent Blocks (Roxtec).
- .4 Prefabricated Cable Pathways (EZ-Path).
- .5 Systems for Electrical, and Data and Communications Cables: Select one or more of the following fill materials:
 - .1 Latex sealant.
 - .2 Silicone sealant.
 - .3 Intumescent putty.
 - .4 Silicone foam.
 - .5 Prefabricated Firestop Sleeve CP 653 (Hilti).
 - .6 Preformed Intumescent Blocks CFS-BL (Hilti).
 - .7 Preformed Intumescent Blocks (Roxtec).
 - .8 Prefabricated Cable Pathways (EZ-Path).
 - .9 Intumescent foam blocks or boards.
 - .10 Intumescent spray foam.
- .6 Systems for Cable Trays: Select one or more of the following fill materials:
 - .1 Latex sealant.
 - .2 Intumescent putty.
 - .3 Silicone foam.
 - .4 Pillows/bags.
 - .5 Intumescent foam blocks or boards.
- .7 Systems for Insulated Pipes: Select one or more of the following fill materials:
 - .1 Latex sealant.
 - .2 Intumescent putty.
 - .3 Silicone foam.
 - .4 Intumescent wrap strips.
 - .5 Intumescent foam blocks or boards.
 - .6 Intumescent spray foam.
- .8 Systems for Miscellaneous Electrical Penetrations: Select one or more of the following fill materials:
 - .1 Latex sealant.
 - .2 Intumescent putty.
 - .3 Intumescent foam blocks or boards.
 - .4 Intumescent spray foam.
- .9 Systems for Miscellaneous Mechanical Penetrations: Select one or more of the following fill materials:
 - .1 Latex sealant.
 - .2 Intumescent foam blocks or boards.
 - .3 Intumescent spray foam.

- .10 Systems for Groupings of Penetrations: Select one or more of the following fill materials:
 - .1 Latex sealant.
 - .2 Intumescent wrap strips.
 - .3 Firestopping and Smoke seals device.
 - .4 Intumescent composite sheet.
 - .5 Intumescent foam blocks or boards.
 - .6 Intumescent spray foam.
- .2 Design and provide joint firestopping and smoke seals as follows for:
 - .1 Floor-to-Floor, Fire Resistive Joint System: Provide materials to meet the following criteria:
 - .1 Assembly Rating: As indicated.
 - .2 Nominal Joint Width: As indicated.
 - .3 Movement Capabilities: Compression and extension.
 - .2 Floor-to-Wall, Fire Resistive Joint System: Provide materials to meet the following criteria:
 - .1 Assembly Rating: As indicated.
 - .2 Nominal Joint Width: As indicated.
 - .3 Movement Capabilities: To be confirmed, compression, extension, or horizontal shear.
 - .3 Head-of-Wall, Fire Resistive Joint System: Provide materials to meet the following criteria:
 - .1 Assembly Rating: As indicated.
 - .2 Nominal Joint Width: As indicated.
 - .3 Movement Capabilities: Compression and extension.
 - .4 Wall-to-Wall, Fire Resistive Joint System: Provide materials to meet the following criteria:
 - .1 Assembly Rating: As indicated.
 - .2 Nominal Joint Width: As indicated.
 - .3 Movement Capabilities: Compression and extension.
- .3 Design and provide perimeter fire containment firestopping and smoke seals as follows for:
 - .1 Perimeter Fire Containment System: Provide materials to meet the following criteria:
 - .1 Integrity Rating: As indicated.
 - .2 Insulation Rating: As Indicated.
 - .3 Linear Opening Width: As indicated.

END OF SECTION

Part 1 General

1.1 SUMMARY

- .1 Section Includes:
 - .1 Sealant types:
 - .1 Acrylic latex one part.
 - .2 Mould and mildew resistant.
 - .3 Silicone for general construction and air-seal.
 - .4 Silicone for structural glazing.
 - .5 Acoustical.
 - .6 Multi-component polyurethane.
 - .7 Single-component polyurethane or hybrid.
 - .8 Horizontal joint two component, self-levelling.
 - .9 One part moisture curing, low modulus polyurethane.
 - .10 Control joint.
 - .2 Accessories: Rod backings, high density foam, bond breaker tape, preformed sealants, primer, joint cleaner and bond breaker.
- .2 Related Requirements:
 - .1 Section 03 30 00 – Cast-In-Place Concrete
 - .2 Section 06 40 00 – Architectural Woodwork
 - .3 Section 07 21 19 – Foamed-In-Place Insulation
 - .4 Section 07 27 19 – Sheet Membrane Air and Vapour Barrier
 - .5 Section 07 52 00 – Modified Bituminous Membrane Roofing
 - .6 Section 07 62 00 – Sheet Metal Flashing and Trim
 - .7 Section 08 11 13 – Steel Doors and Frames
 - .8 Section 08 11 16 – Aluminum Doors and Frames
 - .9 Section 08 44 13 – Glazed Aluminum Curtain Walls
 - .10 Section 08 80 50 – Glazing
 - .11 Section 09 21 16 – Gypsum Board Assemblies
 - .12 Section 09 30 13 – Tiling
 - .13 Section 09 65 00 – Resilient Flooring
 - .14 Division 23 – Mechanical
 - .15 Other technical sections as required.

1.3 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Submit product data in accordance with Section 01 33 00 – Submittal Procedures.
 - .1 Submit Workplace Hazardous Materials Information System WHMIS SDS - Safety Data Sheets. WHMIS SDS acceptable to Labour Canada and Health and Welfare Canada for sealants. Indicate VOC content.

- .2 Submit samples in accordance with Section 01 33 00 – Submittal Procedures.
 - .1 Provide colour samples of the actual sealants for approval; painted or printed colour charts are not acceptable.
- .3 When required by Consultant, submit test certificates from an approved Canadian materials testing laboratory indicating that sealants meet the requirements of the standards specified, and that the tests have been conducted in accordance with ASTM D2240.
- .4 Submit manufacturer's printed product literature, specifications and data sheet. Indicate the following:
 - .1 Caulking compound.
 - .2 Primers.
 - .3 Sealing compound, each type, including compatibility when different sealants are in contact with each other.
 - .4 Manufacturers Warranty.
- .5 Submit manufacturer's installation instructions for each product used.
- .6 LEED Submittals: provide LEED submittals in accordance with Section 01 61 00 – LEED Product Requirements.

1.4 QUALITY ASSURANCE

- .1 Caulking shall be performed by a manufacturer approved contractor with minimum three years successful experience in Work of similar size and complexity.
- .2 Before performing Work of this Section, submit the names of proposed materials. If specified using Standards, indicate Qualification Number.
- .3 Compatibility: Ensure sealants are compatible with adjacent materials and are approved by manufacture for use with adjacent materials.
- .4 Mock-Ups:
 - .1 Construct mock-up in accordance with Section 01 45 00 - Quality Control.
 - .2 Before performing caulking work do sample applications of each type of sealant for approval. Site locations for sample applications shall be designated by Consultant. Approved samples shall form standard for this project and no work of inferior quality will be allowed. Start no final work until approval of samples is given by the Consultant.
 - .3 Sealant manufacturer to perform pull test to confirm adhesion of all exterior sealants types. Allow Consultant to perform pull tests as required to verify sealant installation.
- .5 Consultant may do pull tests on site installed beads at minimum 5 locations. Contractor to cut sealants when Consultant is present and repair sealant beads after tests are complete.

1.5 DELIVERY, STORAGE, AND HANDLING

- .1 Deliver, handle, store and protect materials in accordance with Section 01 61 00 - Common Product Requirements.

- .2 Deliver containers labelled and sealed, complete with written application and maintenance instructions.
- .3 Store materials in a dry heated enclosure in accordance with manufacturer's instructions.
- .4 Remove from site and dispose of packaging materials at appropriate recycling facilities.
- .5 Place materials defined as hazardous or toxic in designated containers.
- .6 Handle and dispose of hazardous materials in accordance with the CEPA, TDGA, Regional and Municipal regulations.
- .7 Unused sealant material must not be disposed of into sewer system, into streams, lakes, onto ground or in other location where it will pose health or environmental hazard.
- .8 Divert unused joint sealing material from landfill to official hazardous material collections site approved by Consultant.
- .9 Empty plastic joint sealer containers are not recyclable. Do not dispose of empty containers with plastic materials destined for recycling.
- .10 Fold up metal banding, flatten, and place in designated area for recycling.
- .11 Packaging Waste Management
 - .1 Separate and recycle waste materials in accordance with Section 01 74 19 – Construction Waste Management.

1.6 SITE CONDITIONS

- .1 Ambient Conditions:
 - .1 Do not proceed with installation of joint sealants under following conditions:
 - .1 When ambient and substrate temperature conditions are outside limits permitted by joint sealant manufacturer or are below 4.4 degrees C.
 - .2 When joint substrates are wet.
- .2 Joint-Width Conditions:
 - .1 Do not proceed with installation of joint sealants where joint widths are less than or greater than those allowed by joint sealant manufacturer for applications indicated.
- .3 Joint-Substrate Conditions:
 - .1 Do not proceed with installation of joint sealants until contaminants capable of interfering with adhesion are removed from joint substrates.
 - .2 Substrate must be clean, dry, and frost free.

1.7 WARRANTY

- .1 Contractor hereby warrants that caulking work will not leak, crack, crumble, melt, shrink, run, lose adhesion or stain adjacent surfaces in accordance with General Conditions, but for three years.

- .2 Provide Warranty for sealants to include in maintenance manuals as specified in Section 01 78 00 – Closeout Submittals.

Part 2 Products

2.1 MANUFACTURERS

- .1 Acceptable Manufacturers: Subject to compliance with requirements in this Section and as recommended by the manufacturer, manufacturers offering products that may be incorporated into the Work include the following:
 - .1 Master Builders Solutions (previously BASF, Sonneborn).
 - .2 Chemtron Manufacturing Ltd.
 - .3 Dow
 - .4 GE Silicones Limited.
 - .5 Loxon, Sherwin Williams
 - .6 MAPEI Inc.
 - .7 Pecora
 - .8 Sika Chemical of Canada Ltd.
 - .9 Tremco Ltd.
 - .10 W.R. Meadows

2.2 PERFORMANCE/DESIGN CRITERIA

- .1 Sealant Design: Design Structural sealant to withstand loads without breakage, loss, failure of seals, product deterioration, and other defects.
- .2 Design installed sealant to withstand:
 - .1 Dead loads and live loads caused by positive and negative wind loads acting normal to plane of wall as calculated in accordance with BC Building Code. as measured in accordance with ASTM E330/E330M.
 - .2 Movement from ambient temperature range of 49 degrees C.
 - .3 Movement and deflection of structural support framing.
 - .4 Water and air penetration.
- .3 Sealant system shall satisfy following requirements for duration of warranty period:
 - .1 Waterproof, flexible, and thermally compatible with substrate under applicable service conditions.
 - .2 Provide a weather-tight seal that does not allow moisture penetration.
 - .3 Shall not debond, crack, or craze.
 - .4 Shall not leak.
- .4 Reference to products does not relieve manufacturer of responsibility to comply fully with specified criteria.

2.3 SEALANT MATERIALS

- .1 Do not use caulking that emits strong odours, contains toxic chemicals or is not certified as mould resistant in air handling units.

- .2 When low toxicity caulks are not possible, confine usage to areas which off gas to exterior, are contained behind air barriers, or are applied several months before occupancy to maximize offgas time.
- .3 Unless otherwise specified, VOC content limits of sealants shall be in accordance with SCAQMD Rule 1168 and as follows:
 - .1 Architectural Materials:
 - .1 Sealants: VOC content limit 250 g/L.
 - .2 Sealant Primers for Non-Porous Surfaces: VOC content limit 250 g/L.
 - .3 Sealant Primers for Porous Surfaces: VOC content limit 775 g/L.
 - .2 Roofing:
 - .1 Non-Membrane Related Sealants: VOC content limit 300 g/L.
 - .2 Single Ply Roofing Sealants: VOC content limit 450 g/L.
 - .3 SBS Membrane Sealant Primer: VOC content limit 500 g/L.
 - .3 All Other Applications:
 - .1 Sealants: VOC content limit 420 g/L.
 - .2 Sealant Primers: VOC content limit 750 g/L.

2.4 SEALANT MATERIAL DESIGNATIONS

- .1 Type S-1: Acrylic Latex One Part, Shore A Hardness 20, to ASTM C834.
 - .1 Acceptable Materials:
 - .1 Latacalk, Chemtron.
 - .2 Sonolac, BASF Sonneborn.
 - .3 Latex 100, Tremco.
- .2 Type S-2: Silicone Sealant, mould and mildew resistant to ASTM C920; type S; grade NS; class 50; use NT, G, and A.
 - .1 Acceptable Materials:
 - .1 Multiseal, Chemtron.
 - .2 Dowsil 795 Silicone, Dow
 - .3 SCS2000, GE.
 - .4 895 NST, Pecora
 - .5 Spectrem 2 Silicone, Tremco Inc.
 - .6 Knight Shield Silicone 5700 Series, W. R. Meadows
- .3 Type S-3: Silicone Sealant, general construction and air-seal sealant.
 - .1 To ASTM C920: type S; grade NS; class 25; use NT, M, G, A, O.
 - .1 Acceptable Materials:
 - .1 Dowsil 790 Silicone, Dow (for porous substrates)
 - .2 Dowsil 795 Silicone, Dow (for non-porous substrates)
- .4 Type S-5: Acoustical Sealant, interior, non-skimming, non-hardening, simple component synthetic rubber sealant.
 - .1 Acceptable Materials:

- .1 Metaseal, Chemtron.
- .2 AIS 919, Pecora
- .3 Acoustical Sealant, Tremco.
- .5 Type S-6: Multi-component polyurethane sealant, chemical curing, exterior wall sealant.
 - .1 To ASTM C920: type M; grade NS; class 50; use T, NT, M, A, O.
 - .2 Acceptable Materials:
 - .1 MasterSeal NP2, BASF.
 - .2 Thioplast 400, Chemtron.
 - .3 830, Isoflex.
 - .4 Dynatrol II, Pecora
 - .5 Sikaflex 2c NS, Sika.
 - .6 Dymeric, Tremco.
 - .7 Deck-O-Seal, W. R. Meadows
- .6 Type S-7: Single-component polyurethane or hybrid sealant, non-sag, for general construction.
 - .1 To ASTM C920: type S; grade NS; class 25; use NT, M, A, O, T.
 - .2 Acceptable Materials:
 - .1 Masterseal NPI or 150, BASF Sonneborne.
 - .2 Multiflex, Chemtron.
 - .3 H1 or S1, Loxon
 - .4 Mapeflex P1, MAPEI Inc.
 - .5 Dynatrol I-XL Hybrid, Pecora
 - .6 Sikaflex 1a or SikaHyflex 150LM, Sika.
 - .7 Dymonic FC, Tremco Inc.
 - .8 Pourthane NS, W.R. Meadows Canada.
- .7 Type S-8: Horizontal joint sealant, two component, self-levelling.
 - .1 To ASTM C920: type M; grade P; class 25; use T, M, O.
 - .2 Acceptable Materials:
 - .1 Sonolastic SG, BASF Sonneborn.
 - .2 Mapeflex P2 SL, MAPEI Inc.
 - .3 Dynatrol II, Pecora
 - .4 Sikaflex 2c SL, Sika.
 - .5 THC-901, Tremco Inc
- .8 Type S-9: One part moisture curing, low modulus polyurethane sealant for sealing joints in level and slightly slope surfaces conforming to ASTM C920, type S, grade P, class 50, use T, M, A, O, MC-1-25-B-N.
 - .1 Acceptable Materials:
 - .1 Sonolastic SL 1, BASF Sonneborn.
 - .2 Urexpan NR-201, Pecora
 - .3 Vulkem 45 SSL, Tremco Inc.

- .4 Pourthane SL, W. R. Meadows
- .9 Type S-10: Control joint sealant, two-component, epoxy-urethane, self-levelling, load bearing saw cut or preformed control joints.
 - .1 Acceptable Materials:
 - .1 Loadflex, Sika
 - .2 Rezi-Weld Flex, W. R. Meadows
- .10 Type S-11: Control Joint Sealant, two component, polyurea based, load bearing, self levelling sealant.
 - .1 Acceptable Materials:
 - .1 Euco Qwikjoint 200, Euclid Chemical.
 - .2 Planiseal Rapid Joint 15, MAPEI Inc.
- .11 Type S-12: Control Joint Sealant, two component, semi-rigid epoxy, load bearing, self levelling sealant.
 - .1 Acceptable Materials:
 - .1 Dural 340 SL, Euclid Chemical.
 - .2 Rezi-Weld Flex, WR Meadows.
- .12 Type S-13: Single-component polyurethane sealant, medium-modulus, non-sag, low-VOC, UV stable.
 - .1 To ASTM C920: type S; grade NS; class 50; use NT, T, M, A, O, I.
 - .2 Acceptable Materials:
 - .1 Multiflex, Chemtron.
 - .2 Vulkem 116, Mameco.
 - .3 Dymonic 100, Tremco Inc.
 - .4 Pourthane NS, W. R. Meadows

2.5 COLOURS

- .1 Colours: To match adjacent materials, as selected by Consultant, from manufacturer's standard colour range. Confirm with Consultant prior to application.

2.6 SEALANT SELECTION

- .1 Where no specified type of sealant is shown or specified, confirm sealants specified in this Section appropriate for its location.
- .2 Make sealant selections consistent with manufacturer's recommendations.
- .3 Use acrylic sealant Type S-1 only on the interior and only in situations where little or no movement can occur.
- .4 Use mould & mildew resistant silicone sealant Type S-2 for non-moving joints in washrooms and kitchens. Do not use on floors.
- .5 Use silicone general construction sealant Type S-3 or Type S-6 and S-7 for all joints, interior and exterior, where no other specific sealant type specified. Use Type S-6 for joints over 19 mm.

- .6 Use acoustical sealant Type S-5 and air seal sealant Type S-3 only where they will be fully concealed and only where no constant or consistent air pressure difference will exist across the joint.
- .7 Use multi-component sealant type S-6, primed penetration element surfaces other than concrete, for mechanical and electrical service penetrations in concrete foundation walls.
- .8 Use multi-component sealant Type S-8 for horizontal joint sealant of plaza, floors and decks, exterior areas only, subject to pedestrian and vehicular traffic.
- .9 Use polyurethane, semi-self levelling sealant Type S-9 for in expansion joints in sidewalks, plazas, floors and other pedestrian and vehicular horizontal surfaces with slopes up to 6%.
- .10 Use control joint sealant S-10 as filler for interior, horizontal saw cut or preformed control joints where joints are subject to load bearing conditions.
- .11 Use control joint sealant S-11 as filler for interior, horizontal saw cut or preformed control joints, where joints are subject to low temperatures (freezer floors) and where joints require nosing support.
- .12 Use control joint sealant S-12 as filler for interior, horizontal saw cut or preformed control joints where joints are subject to thermal shock conditions, traffic loops, and where a high bond strength is required.
- .13 Use sealant S-13 for sealing exterior holes and penetrations around pipes and other services passing through concrete foundations and requiring greater movement capability.

2.7 ACCESSORIES

- .1 Preformed Compressible and Non-Compressible back-up materials that are non-staining, compatible with joint substrate, sealants, primers, and other joint fillers, and are approved for applications indicated by sealant manufacturer based on site experience and laboratory testing.
 - .1 Rod Type Sealant Backings:
 - .1 ASTM C1330, Type C (closed cell material with a surface skin), Type O (open cell material) or Type B (bi-cellular material with a surface skin).
 - .2 Use any of the preceding types, as approved in writing by joint sealant manufacturer for joint application indicated.
 - .3 Size and density to control sealant depth and otherwise contribute to producing optimum sealant performance.
 - .4 Non-adhering to sealant, to maintain two sided adhesion across joint.
 - .5 Allow backer rod to breathe outside of packaging 24 hours before application.
 - .6 Oversize 30% to 50% of joint size.
 - .2 High Density Foam.
 - .1 Extruded closed cell polyvinyl chloride (PVC), extruded polyethylene, closed cell, Shore A hardness 20, tensile strength

140 to 200 kPa, extruded polyolefin foam, 32 kg/m³ density, or neoprene foam backer, size as recommended by manufacturer.

- .3 Bond Breaker Tape.
 - .1 Polyethylene bond breaker tape or other tape recommended by sealant manufacturer which will not bond to sealant.
- .2 Preformed Sealants
 - .1 Preformed Silicone Sealant System: Manufacturer's standard system consisting of pre-cured low modulus silicone extrusion, in sizes to fit joint widths indicated, combined with a neutral curing silicone sealant for bonding extrusions to substrates:
 - .1 Acceptable Materials:
 - .1 Dowsil; 123 Silicone Seal, Dow.
 - .2 UltraSpan US1100, GE Silicones
 - .3 Spectrem Simple Seal, Tremco.
 - .3 Primer: Non-staining type as recommended by sealant manufacturer.
 - .4 Joint Cleaner: Non-corrosive solvent type recommended by sealant manufacturer for applicable substrate materials.
 - .5 Bond Breaker: Pressure-sensitive plastic tape that will not bond to sealants.

Part 3 Execution

3.1 PROTECTION

- .1 Protect installed Work of other trades from staining or contamination.

3.2 EXAMINATION

- .1 Carefully inspect surfaces, materials to receive sealants and verify they are physically capable of retaining sealant bond.
- .2 Verify that fillers and backing provided under other Sections properly installed.
- .3 Grind joint surfaces if required to achieve adequate surface preparation.

3.3 PREPARATION

- .1 Prepare surfaces in accordance with manufacturer's instructions.
- .2 Examine joint sizes and conditions to establish correct depth to width relationship for installation of backup materials and sealants.
- .3 Maintain workmanship of highest quality in accordance with best trade practice.
- .4 Ensure that joint forming materials are compatible with sealant.
- .5 Clean bonding joint surfaces of harmful matter substances including dust, rust, oil grease, and other matter which may impair Work. Wire brush loose materials and other foreign matter which might impair adhesion of sealant.
- .6 Use air stream to blow out dirt and water from crevices.
- .7 Ensure joint surfaces are dry and frost free.

- .8 Prime all porous material (e.g. wood, masonry, concrete, ceramic or paver tile, etc).
- .9 Prime other joints when recommended by manufacturer. Use a brush that will reach all parts of the joints. Mask adjoining surfaces with tape prior to priming to prevent staining.

3.4 PRIMING

- .1 Where necessary to prevent staining, mask adjacent surfaces prior to priming and caulking.
- .2 Prime sides of joints in accordance with sealant manufacturer's instructions immediately prior to caulking.

3.5 BACKUP MATERIAL

- .1 Use backer rod as specified, to limit depth of sealant and to act as bond breaker at back of joint.
- .2 Install joint filler to achieve correct joint depth and shape, with approximately 30% - 50% compression.
- .3 Where depth of joint does not permit the use of backer rod apply paper masking tape to back of joint to act as bond breaker.
- .4 Ensure that no joints are formed which are bonded on adjacent sides where there is any possibility of movement.

3.6 MIXING

- .1 Mix materials in strict accordance with sealant manufacturer's instructions.

3.7 APPLICATION

- .1 Apply sealant in strict accordance with manufacturer's recommendations.
- .2 For joints where movement is possible, apply backer rod to achieve a joint depth of one half the joint width but not less than 9 mm; for joints larger than 25 mm use a depth of 13 mm.
- .3 Use pressure gun fitted with suitable nozzle. Use sufficient pressure to fill voids and joints solid.
- .4 Form surface of sealant smooth, free from ridges, wrinkles, sags, or air pockets and imbedded impurities. Neatly tool surface to a slight concave appearance.
- .5 Tool sealants to achieve air tight joints. Use wet tools as required.
- .6 Ensure bead is solid, filling entire space between sides and bedding material, exerting sufficient pressure to obtain maximum bond, by allowing sealant to bulge out in advance of nozzle.
- .7 Apply sealant within recommended temperature ranges. Consult manufacturer when sealant cannot be applied within recommended temperature range.
- .8 Seal perimeters of hollow metal door frames on both sides.
- .9 Seal control joints in gypsum board and stucco, and junctures between interior partitions with exterior walls.

- .10 Seal window and door frames around the inside perimeter, so that an airtight seal is obtained, as indicated on drawings.
- .11 Seal joints in floors and walls and around service and mechanical and electrical fixture penetrations.
- .12 Seal at all locations where dissimilar material meet.
- .13 Curing
 - .1 Cure sealants in accordance with sealant manufacturer's instructions.
 - .2 Do not cover up sealants until proper curing has taken place.
 - .3 On porous surfaces allow sealant to cure overnight, and remove excess by light wire brushing.

3.8 CLEANING

- .1 Clean adjacent surfaces immediately and leave Work neat and clean.
- .2 Remove excess and droppings, using recommended cleaners as work progresses.
- .3 Remove masking tape after initial set of sealant.
- .4 Correct staining and discolouring of adjacent surfaces as directed by Consultant.

END OF SECTION

Part 1 General

1.1 SUMMARY

- .1 Section Includes:
 - .1 Steel doors.
 - .2 Steel door frames.
 - .3 Sidelite frames.
 - .4 Fire-rated door and frame assemblies.
- .2 Related Requirements:
 - .1 Section 07 21 19 – Foam-In-Place Insulation
 - .2 Section 07 27 13 – Modified Bituminous Air and Vapour Barrier
 - .3 Section 07 27 19 – Sheet Membrane Air and Vapour Barrier
 - .4 Section 07 62 00 – Sheet Metal Flashing and Trim
 - .5 Section 07 92 00 – Sealants
 - .6 Section 08 11 16 – Aluminum Doors and Frames
 - .7 Section 08 71 00 – Door Hardware
 - .8 Section 08 80 50 – Glazing
 - .9 Section 09 21 16 – Gypsum Board Assemblies
 - .10 Section 09 91 00 – Painting

1.3 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Product Data:
 - .1 Submit product data in accordance with Section 01 33 00 – Submittal Procedures:
 - .2 Submit manufacturer's printed product literature, specifications and data sheets for each type of door and frame specified.
- .2 Shop Drawings:
 - .1 Submit shop drawings in accordance with Section 01 33 00 – Submittal Procedures:
 - .2 Indicate general construction of each type of door and frame, configurations, locations, door handing, sizes, material, material thickness, core description and details, edge construction, jointing methods, mortises, reinforcements, anchors, arrangement of hardware, fire ratings, finish and special features.
 - .3 Detail continuity of air, vapour, and thermal barriers at changes in plane, at transitions, and at penetrations.

- .4 Reference door and frame types to Door Schedule. Indicate door numbers where applicable.
- .3 Submit test and engineering data, and installation instructions.
- .4 Test and Evaluation Reports:
 - .1 Submit test reports from approved independent testing laboratories, certifying compliance with specifications.
 - .2 All test reports that reference the NAFS must include, on the first page, a summary of the results including, at minimum:
 - .1 The product manufacturer.
 - .2 The type of product.
 - .3 The model number/series number.
 - .4 The primary product designation.
 - .5 The secondary product designation.
 - .1 Positive design pressure.
 - .2 Negative design pressure.
 - .3 Water penetration resistance test pressure.
 - .4 Canadian air infiltration and exfiltration levels.
 - .6 The test completion date.
 - .7 The report will also contain the following information:
 - .1 Test dates.
 - .2 Report preparation dates.
 - .3 Test information retention period.
 - .4 Location of testing facilities.
 - .5 Full description of test samples, including:
 - .1 finish, weathering characteristics
 - .2 Condensation resistance.
 - .3 Forced entry resistance.
 - .6 Complete description of amendments, as applicable.
 - .7 Conclusion.
 - .8 Drawings signed by the testing laboratory, if provided.
- .5 LEED Submittals: provide LEED submittals in accordance with Section 01 61 01 - LEED Product Requirements.

1.4 CLOSEOUT SUBMITTALS

- .1 Provide maintenance data for cleaning and maintenance of finishes for incorporation into manual specified in Section 01 78 00 - Closeout Submittals.

1.5 QUALITY ASSURANCE

- .1 Quality Standard: Comply with ANSI A250.8, unless more stringent requirements are indicated. Comply with ICC A117.1.
- .2 Qualifications

- .1 Manufacturer/Fabricator: Use a member in good standing of the Canadian Steel Door and Frame Manufacturer's Association.
- .2 Installer: Use installers who are experienced with the installation of hollow metal doors and frames of similar complexity and extent to that required for the Project.
- .3 Preconstruction Testing: Provide fire labelled frame products for those openings requiring fire protection ratings, as scheduled:
 - .1 List by nationally recognized agency having factory inspection service and construct as detailed in Follow-up Service Procedures/Factory Inspection Manuals issued by listing agency to individual manufacturers.

1.6 DELIVERY, STORAGE, AND HANDLING

- .1 Deliver, store and handle materials in accordance with Section 01 61 01 - LEED Product Requirements and as follows:
 - .1 Receive and store materials as recommended by materials manufacturer.
 - .2 Inspect and frames on delivery for damage, and notify shipper and supplier if damage is found. Minor damages may be repaired provided refinished items match new work and are acceptable to Consultant. Remove and replace damaged items that cannot be repaired as directed.
 - .3 Adequately protect surfaces from damage during moving, handling and storage.
- .2 Packaging Waste Management
 - .1 Separate and recycle waste materials in accordance with Section 01 74 19 – Construction Waste Management.

Part 2 Products

2.1 PERFORMANCE/DESIGN CRITERIA

- .1 Perform work in accordance with CSDMA, Recommended Specifications for Commercial Steel Doors and Frames, except as otherwise specified herein.
- .2 Provide doors and frames complying with ANSI A250.8 for quality and ANSI A250.4 for physical-endurance level.
- .3 Design exterior frame assembly to accommodate expansion and contraction when subjected to minimum and maximum surface temperature of -35 degrees C to 35 degrees C.
- .4 Maximum deflection for exterior steel entrance screens under wind load of 1.2 kPa not to exceed 1/175th of span.
- .5 Steel fire rated doors and frames: Label and list fire rated doors and frames by an organization accredited by the Standards Council of Canada in conformance with CAN4-S104 and CAN4-S105 for ratings indicated. Fire labels must be factory applied by the manufacturer.
- .6 Thermal Transmittance: R-value of 3.4 to ASTM C1363 and NFRC 102.
- .7 Air Infiltration: < 0.1 cfm/ft2 to ASTM E283/E283M and NFRC 400.

- .8 Be responsible for securing approval from authorities having jurisdiction for materials, fabrication and installation of fire rated oversized door and frame assemblies.

2.2 MATERIALS

- .1 Steel:
- .1 Doors and Frames: coated steel sheets to ASTM A924/A924M; coating designation to ASTM A653/A653M: Commercial Steel (CS), Type B, ZF120 (A40) galvanized; stretcher levelled.
 - .2 Exterior doors and frames: coated steel sheets to ASTM A924/A924M; coating designation to ASTM A653/A653M: Commercial Steel (CS), Type B, ZF120 (A40) galvanized; stretcher levelled.
 - .3 Metallic coated steel sheets in accordance with ASTM A924/A924M; coated to meet requirements of ASTM A653/A653M, Commercial Steel (CS), Type B, ZF75 galvanized; suitable for unexposed applications; stretcher levelled standard of flatness. Provide Canadian produced steel.
- .2 Nominal Base Metal Thickness Requirements:
- .1 Frames: refer to frame fabrication requirements specified in this section.
 - .2 Doors: refer to door fabrication requirements specified in this section.
 - .3 Hardware Reinforcement for Doors and Frames: Carbon steel, welded in place, prime painted, to the following minimum nominal thicknesses:

Hardware Reinforcement	Door (mm)	Frame (mm)
Mortise Hinge:	3.51	3.51
Mortise or Bored Lock or Deadbolt:	1.98	1.98
Flush or Surface Bolt Front:	1.98	1.98
Surface or Concealed Closer:	2.74	2.74
Strike Reinforcements:	1.98	1.98
Hold Open Arm:	1.98	1.98
Electronic Hardware Reinforcements:	1.98	1.98
Pull Plates and Bars:	1.30	1.30
Mortar Box:	--	0.84
Surface Exit Devices:	1.98	1.98
Door Surface Hardware Reinforcements:	1.30	1.30
Frame surface hardware reinforcements:	2.74	2.74
Notes: Provide guard boxes to protect mortised cut-outs from spray applied insulation, fully sealed.		

- .3 Door Core Materials
- .1 Honeycomb (interior only): Structural small cell 25 mm maximum. kraft paper honeycomb:
 - .1 Weight: 36.3 kg/ream minimum.
 - .2 Density: 16.5 kg/m³ minimum.

- .3 Sanded to required thickness.
- .2 Polyurethane: rigid, cellular type, board, conforming to ASTM D1622/D1622M, or foamed-in-place, 29 kilograms per cubic meter density minimum, containing no urea formaldehyde resins.

2.3 ADHESIVES

- .1 Honeycomb cores and steel components: heat resistant, spray grade, resin reinforced neoprene/rubber (polychloroprene) based, low viscosity, contact cement.
 - .1 Adhesive: maximum VOC content 50 g/L to SCAQMD Rule 1168.
- .2 Polyurethane cores: heat resistant, epoxy resin based, low viscosity, contact cement.
- .3 Interlocking Edge Seam Adhesive: fire resistant, resin reinforced polychloroprene, high viscosity, sealant/adhesive.

2.4 PRIMER

- .1 Touch-up primer: to ASTM A780/A780M and SSPC-PS 12.01.
 - .1 Maximum VOC limit 50 g/L to GS-11.

2.5 FINISHING

- .1 Shop apply zinc rich primer to repair damaged zinc coatings arising from fabrication; cure primer fully before shipping to site; include compatible primer for site finishing and correction of surface abrasions to zinc coatings and factory applied primer.
- .2 Remove weld slag and splatter from exposed surfaces.
- .3 Fill and sand smooth tool marks, abrasions and surface blemishes to present smooth uniform surfaces. Prepare surfaces for field painting to ASTM D6386 and ASTM D7396 and Section 09 91 00 - Painting.

2.6 ACCESSORIES

- .1 Door silencers (bumpers): Grey rubber, to ANSI/BHMA A156.16 Type 6-180; three silencers on strike jambs of single door frames; two silencers on heads of double door frames; screw fastener applied. Stick on bumpers are not acceptable.
- .2 Floor anchors: 3.5 mm minimum adjustable floor clip angles with 2 holes for anchorage to floor.
- .3 Exterior Top Caps: Rigid polyvinylchloride (PVC) extrusion in accordance with CGSB 41-GP-19Ma.
- .4 Provide full height astragals on all double doors.
- .5 Fabricate glazing stops as formed channel, minimum 16 mm height, accurately fitted, butted at corners and fastened to frame sections with counter-sunk oval head sheet metal screws.
- .6 Make provisions for glazing as indicated and provide necessary glazing stops.

- .1 Provide removable glazing beads for use with glazing tapes and compounds and secured with countersunk stainless steel screws.
- .2 Design exterior glazing stops to be tamperproof.
- .7 Metallic paste filler: to manufacturer's standard.
- .8 Fasteners: tamperproof type 304 stainless steel screws with countersunk flat head.
- .9 Labels for fire doors and door frame: brass plate, riveted to door and door frame.
- .10 Sealant: Section 07 92 00 – Sealants.
 - .1 Maximum VOC limit 250 g/L to SCAQMD Rule 1168.
- .11 Glazing: Section 08 80 50 – Glazing.

2.7 FABRICATION GENERAL

- .1 Welded construction: assemble units by welding in accordance with CSA W59 to produce a finished unit square, true and free of distortion. Welding shall be undertaken only by a fabricator fully approved by the Canadian Welding Bureau to the requirements of CSA W47.1.
- .2 Fabricate steel doors and frames units complying with ANSI/SDI A250.8 and to be rigid, neat in appearance, and free from defects including warp and buckle. Where practical, fit and assemble units in manufacturer's plant. Clearly identify work that cannot be permanently factory assembled before shipment, to assure proper assembly at Project site.
- .3 Permit access by an approved inspection and testing company for the purpose of inspecting at random, doors being fabricated for this project.
- .4 Make provisions in doors and frames to suit requirements of trade or section providing electrically operated hardware or security devices. Provide removable plates or knock outs for electrical contacts. Provide junction boxes on security door frames as required for door strikes, mag locks and door contacts. Ensure frames arrive on site prepared for wiring.
- .5 Fabricate galvanized steel channels to reinforce frames and screens as required for size, and for fire protection rating requirements. Extend reinforcements from floor to structure above. Design top connection to accommodate structural deflection. Conceal reinforcements in frames and screens.
- .6 Fabricate all rated doors, frames and screens to fire rating labelling authority standard.

2.8 FRAMES AND SCREENS FABRICATION: GENERAL

- .1 Fabricate frames in accordance with CSDMA specifications and ANSI/SDI A250.8.
- .2 Accurately form frames to profiles indicated. Construct frames straight and free from twist or warp.
- .3 Exterior frames: 1.98 mm minimum thermally broken type construction. 50 mm face standard frame profile, throat and frame width to suit wall construction.
- .4 Interior frames: 1.6 mm minimum for single doors; 1.98 mm for frames with opening width in excess of 1220 mm; welded type construction. 50 mm face

- standard frame profile, throat and frame width to suit wall construction. Knock-down frames are not allowed.
- .5 Blank, drill, reinforce and tap frames to receive mortised, templated hardware, security, and electrical devices, using templates provided by finish hardware supplier. Reinforce frames for installation of closers. For transportation, install stiffener plates or two angle spreaders where required to prevent bending of frame and to maintain alignment when setting. Weld reinforcement in place. Remove prior to installation.
 - .6 Provide removable portion of stop and frame where required for overhead concealed door closers, properly connected to frame, and prepare for attachment of closer prior to shipment.
 - .7 Protect mortised cutouts with steel guard boxes.
 - .8 Manufacturer's nameplates on frames and screens are not permitted.
 - .9 Conceal fastenings except where exposed fastenings are indicated.
 - .10 Provide factory-applied touch up primer at areas where zinc coating has been removed during fabrication.
 - .11 Partition Screens:
 - .1 Fabricate metal screens to profiles indicated.
 - .2 Supply jamb and mullion extensions and anchors required to secure screens to structure or framing provided under other Sections. Fabricate anchorage to prevent transfer of load from support framing to the screens when deflection of structure occurs.
 - .3 Provide concealed reinforcement for screens to receive handrails.
 - .4 Provide closely fitted steel glass stops where required. Mitre corners. Drill and countersink fasteners symmetrically at 150 mm o.c. Screw stops in place.
 - .12 Provide fire labelled frames for those openings requiring fire protection ratings, as scheduled on Drawings.

2.9 FRAME ANCHORAGE

- .1 Provide appropriate anchorage to floor and wall construction.
- .2 Where frames terminate at finished floor, supply floor plates for anchorage to slab. Check depth of extension of finished floor to structural slab and provide jamb extension anchorage as required. Provide 50 mm minimum adjustment.
- .3 Locate wall anchors immediately above or below each hinge reinforcement on the hinge jamb, and directly opposite on the strike jamb. Provide three anchors per jamb for frames up to 2300 mm. Add one anchor per jamb for each additional 760 mm or fraction thereof in frame height.

2.10 FRAMES: WELDED TYPE

- .1 Welding in accordance with CSA W59.
- .2 Cut frame mitres accurately and weld on inside of frame profile. Fill frame corners, exposed surface depressions and butted joints with air drying paste

filler. Sand to a smooth uniform finish. Touch up damaged galvanized finish with zinc rich primer.

- .3 Cope accurately and securely weld butt joints of mullions, transom bars, centre rails and sills.
- .4 Grind welded joints and corners to a flat plane, fill with metallic paste and sand to uniform smooth finish.
- .5 Securely attach floor anchors to inside of each jamb profile.
- .6 Weld in two temporary jamb spreaders per frame to maintain proper alignment during shipment.

2.11 DOOR FABRICATION GENERAL

- .1 Fabricate steel doors rigid, neat in appearance, and free from defects including warp and buckle; 45 mm thickness of types and sizes indicated on drawing, and as follows:
 - .1 Door faces of all steel doors shall be fabricated without visible seams, free of scale, pitting, coil brakes, buckles and waves.
 - .2 Form edges true and straight with minimum radius suitable for thickness of steel used.
 - .3 Bevel lock and hinge edges 3 mm in 50 mm; confirm requirement with builder's hardware or door swing that could dictate a different bevel.
 - .4 Top and bottom of doors shall be provided with inverted, recessed, nominal 1.60 mm steel end channels, welded to each face sheet at 150 mm O/C.
 - .5 Equip exterior doors with factory installed flush PVC top caps. Equip fire labelled exterior doors with factory installed flush steel top caps.
 - .6 Provide fire labelled doors for those openings requiring fire protection ratings, as indicated on Drawings.
 - .7 Fabricate doors with the following clearances:
 - .1 Clearance between door and frame and between meeting edges of doors swinging in pairs shall not exceed 3 mm.
 - .2 Clearance between the bottom of door and floor shall not exceed 19 mm or as required to accommodate specified hardware.
 - .3 Clearance between bottom of door and a raised non-combustible sill in accordance with NFPA (Fire) 80.
 - .4 Clearance between bottom of door and nominal surface of combustible floor coverings in accordance with NFPA (Fire) 80.
- .2 Fabricate doors with longitudinal edges locked seam and spot welded. Seams: not visible, grind welded joints to a flat plane, fill with metallic paste filler and sand to a uniform smooth finish. Bevel both stiles of single doors 1 in 16.
- .3 Exterior Doors: Flush, lock seam construction, insulated doors fabricated in accordance with CAN/CGSB 82.5, and as follows:
 - .1 Face Sheets: Minimum 1.60 mm base steel sheet thickness.
 - .2 Insulation Stiffened Core: Insulated and sound deadened with polystyrene core laminated under pressure to each face sheet.

- .4 Interior Doors: Flush, lock seam construction, hollow steel doors fabricated in accordance with CSDMA Manufacturing Specifications for Doors and Frames, and as follows:
 - .1 Face sheets: Minimum 1.30 mm base steel sheet thickness.
 - .2 Stiffened and sound deadened with honeycomb core laminated under pressure to each face sheet.
- .5 Fire Rated Doors: Flush, lock seam construction, hollow steel doors fabricated in accordance with CAN4 S104 and NFPA (Fire) 80, and as follows:
 - .1 Face sheets: Minimum nominal 1.60 mm base steel sheet thickness.
 - .2 Stiffened and sound deadened with honeycomb core laminated under pressure to each face sheet.
 - .3 Equip pairs of fire labelled doors with minimum 2.74 mm steel surface mounted flat bar astragal, welded to door face; plug welded on face and stitch welded to butt edge of door.
 - .4 Labelled by Underwriters Laboratories of Canada, ITS/Warnock Hersey, or other testing laboratory approved by the authority having jurisdiction.
- .6 Smoke-Control Doors: comply with NFPA (Fire) 105.

2.12 THERMALLY BROKEN FRAMES

- .1 Thermal break: rigid polyvinylchloride extrusion, to ASTM D4726.
- .2 Fabricate thermally broken frames separating exterior parts from interior parts with continuous interlocking thermal break.
- .3 Insulate exterior frame components with polyurethane insulation as indicated in Section 07 21 19 - Foam-in-Place Insulation.

Part 3 EXECUTION

3.1 EXAMINATION

- .1 Verify condition and dimensions of previously installed work upon which this Section depends. Report defects to Consultant. Commencement of work means acceptance of existing conditions.

3.2 INSTALLATION GENERAL

- .1 Compliance: comply with manufacturer's written recommendations or specifications, including product technical bulletins, handling, storage and installation instructions, and datasheets.
- .2 Install fire rated doors and frames in accordance with requirements of NFPA 80.
- .3 Install back angle for sill PMMA membrane to terminate on below the threshold in line with the primary air seal.
- .4 Install doors, frames and accessories in accordance with reviewed shop drawings, ANSI/SDI A250.11, CSDMA Guide Specification for Installation and Storage of Hollow Metal Doors and Frames, manufacturer's data, and as specified in this Section.

- .5 Damaged or twisted door and frames, or doors with interior cores or frame telegraphing through, will be rejected.

3.3 FRAME INSTALLATION

.1 Door Frames:

- .1 Remove temporary spreaders before installing door frames, leaving exposed surfaces smooth and undamaged.
- .2 Set frames accurately in position, plumbed, aligned, and braced securely until permanent anchors are set; limit of acceptable frame distortion 2 mm out of plumb measured on face of frame, maximum twist corner to corner of 3 mm; align horizontal lines in final assembly.
- .3 Brace frames rigidly in position until adjacent construction is complete; install wooden spreaders at third points of frame rebate to maintain frame width, install centre brace to support head of frames 1200 mm and wider in accordance with ANSI/SDI A250.11; do not use temporary metal spreaders for bracing of frames one.
- .4 Place frames before construction of enclosing walls and ceilings, except for frames located in existing walls or partitions allowing for deflection of adjacent construction to ensure that structural loads are not transmitted to frames, and as follows:
 - .1 Check and correct opening width and height, squareness, alignment, twist and plumb as frames are installed in accordance with CSDMA Recommended Dimensional Standards for Commercial Steel Doors and Frames.
 - .2 Metal Stud Partitions: Provide a minimum of three wall anchors per jamb for frames up to 2150 mm high and one additional anchor for each 600 mm over 2150 mm high; install adjacent to hinge location on hinge jamb and at corresponding heights on strike jamb; attach wall anchors to studs with screws.
 - .3 Remove wooden braces after frames are securely fastened or attached to adjacent construction.
- .5 Install glazing materials and studded door silencers.
- .6 Do not site weld unless approved by Consultant in writing for the specific screen.
- .7 For frames over 1220 mm in width, provide vertical support at the centre of head.

.2 Window Frames:

- .1 Installation of borrowed lights is same as for door frames.
- .2 Site assemble large borrowed lights to provide true and even alignment with flush butt hairline jointing, all fasteners concealed.
- .3 Site weld only when approved by Consultant in writing for the specific location.
- .4 Align all horizontal rails in final assembly.
- .5 Install sealant and back-up materials.

- .3 Frame Tolerances: Install frames to tolerances listed in ANSI/SDI A250.11, and as follows:

- .1 Squareness: Maximum 1.6 mm measured across opening between hinge jam and strike jamb.
- .2 Plumbness: Maximum 1.6 mm measured from bottom of frame to head level.
- .3 Alignment: Maximum 1.6 mm measured offset between face of hinge jamb and strike jamb relative to wall construction.
- .4 Twist: Maximum 1.6 mm measured from leading edge of outside frame rabbet to leading edge of inside frame rabbet.
- .4 Install door silencers.
- .5 Caulk perimeter of frames between frame and adjacent material at interior (primary air seal) and exterior (water shedding) seal sides of the door. Allow drainage at the sill. Primary air seal to be continuous with back angle at sill.
- .6 Maintain continuity of air barrier and vapour retarder.

3.4 DOOR INSTALLATION

- .1 Fit hollow metal doors accurately in frames within clearances required for proper operation; shim as necessary for proper operation. Install as specified in ANSI/SDI A250.8.
- .2 Install hardware in accordance with hardware templates and manufacturer's instructions and Section 08 71 00 - Door Hardware.
- .3 Provide even margins between doors and jambs and doors and finished floor and thresholds as follows.
 - .1 Hinge side: 1.0 mm.
 - .2 Latchside and head: 1.5 mm.
 - .3 Finished floor, noncombustible sill and thresholds: 6 mm; 13 mm at openings in non-fire rated separations where undercuts are indicated.
- .4 Install fire-rated doors in corresponding fire-rated frames according to NFPA (Fire) 80.
- .5 Install smoke-control doors according to NFPA (Fire)105.
- .6 Adjust operable parts for correct clearances and function.

3.5 GLAZING

- .1 Install glazing for doors and frames in accordance with Section 08 80 50 - Glazing.

3.6 FINISH REPAIRS

- .1 Touch-up areas where galvanized coating has been removed or damaged with primer.
- .2 Fill exposed frame anchors and surfaces with imperfections with metallic paste filler and sand to a uniform smooth finish.

3.7 FIELD PAINTING

- .1 Prepare surfaces for field painting, to ASTM D6386 and ASTM D7396.

- .2 Field painting: refer to Section 09 91 00 – Painting. Protect weatherstrips from paint. Provide final finish, free of scratches or other blemishes.

3.8 ADJUSTING

- .1 Adjust doors for smooth, easy, free swinging operation and balanced door movement.

3.9 CLEANING

- .1 Clean doors, frames, and screens.

END OF SECTION

Part 1 General

1.1 SUMMARY

- .1 Section Includes: Aluminum-framed glass doors, aluminum swing doors, hardware and aluminum brakeshapes as indicated on Drawings.
- .2 Related Requirements:
 - .1 Section 05 50 00 – Metal Fabrications.
 - .2 Section 06 10 00 – Rough Carpentry.
 - .3 Section 07 27 13 – Modified Bituminous Air and Vapour Barrier
 - .4 Section 07 27 19 – Sheet Membrane Air and Vapour Barrier
 - .5 Section 07 62 00 – Sheet Metal Flashing and Trim
 - .6 Section 07 92 00 – Sealants
 - .7 Section 08 71 00 – Door Hardware.
 - .8 Section 08 80 50 – Glazing
 - .9 Division 26 – Wire and Box Connectors - 0-1000 V, Outlet Boxes, Conduit Boxes and Fittings, Conduits, Conduit Fastenings and Conduit Fittings, Wiring Devices, and Electrical connections for security systems and sensors.

1.3 ADMINISTRATIVE REQUIREMENTS

- .1 Pre-Installation Meetings: convene pre-installation meeting one week prior to beginning work of this Section and on-site installation, with contractor's representative and Consultant in accordance with Section 01 31 19 – Project Meetings to:
 - .1 Verify project requirements.
 - .2 Review manufacturer's installation instructions and warranty requirements.

1.4 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Submit product data in accordance with Section 01 33 00 – Submittal Procedures:
 - .1 Submit manufacturer's printed product literature, specifications and data sheets.
 - .2 Submit WHMIS SDS - Safety Data Sheets. WHMIS SDS acceptable to Labour Canada and Health and Welfare Canada. Indicate VOC's for caulking materials during application and curing.
- .2 Submit shop drawings in accordance with Section 01 33 00 – Submittal Procedures:
 - .1 Indicate materials and profiles and provide full-size, scaled details of components for each type of door and frame. Indicate:
 - .1 Interior trim and exterior junctions with adjacent construction.
 - .2 Junctions between combination units.
 - .3 Elevations of units.
 - .4 Core thicknesses of components.
 - .5 Type and location of exposed finishes, method of anchorage, number of anchors, supports, reinforcement, and accessories.
 - .6 Location of caulking.
 - .7 Each type of door system including location.
 - .8 Arrangement of hardware and required clearances.
 - .9 Detail continuity of air, vapour, and thermal barriers at changes in plane, at transitions, and at penetrations.

- .2 Submit catalogue details for each type of door and frame illustrating profiles, dimensions and methods of assembly.
- .3 Include schedule of U-values, SHGC, and VLT for all products in the form of a site label certificate to show compliance with the specified energy performance requirements
- .4 Submit copies of test reports to establish that the products assembled by this manufacturer comply with the specified Performance Class, Performance Grade, Water Test Pressure, and Air Infiltration/Exfiltration Level as tested to NAFS-11 and the Canadian Supplement.
- .3 Manufacturer's Instructions: Submit manufacturer's installation instructions.
- .4 Testing: provide water penetration field testing to ASTM E1105. Build air tight chamber of steel or wood studs and gypsum or sheathing to withstand the required air pressure differential. Locate test at location as directed by Consultant completed on mock-up prior to moving forward with remaining installations. Access, water, and electricity to be provided by contractor to the testing location on the day of testing. Alterations, retests, repairs, or additions necessary to achieve acceptable performance are to be paid by the Contractor.
- .5 Manufacturers' Field Reports: Submit two copies of manufacturers field reports.
- .6 LEED Submittals: provide LEED submittals in accordance with Section 01 61 01 - LEED Product Requirements.

1.5 CLOSEOUT SUBMITTALS

- .1 Provide maintenance data for cleaning and maintenance of aluminum finishes for incorporation into manual specified in Section 01 78 00 - Closeout Submittals.

1.6 QUALITY ASSURANCE

- .1 Obtain door and curtainwall materials from single manufacturer and/or ensure materials ordered and supplied are compatible with one another.
- .2 Product Labels:
 - .1 All products shall be supplied with factory applied performance rating labels showing Primary and Secondary designators and attesting to conformance with NAFS-11 and CSA A440S1. Alternatively, NAFS performance ratings and test specimen descriptions may be shown on the fenestration shop drawings.
 - .2 All products shall be supplied with factory applied energy performance labels showing product U-values. Energy performance ratings must be certified and labels must bear the mark of one of the agencies recognized as follows: CSA, QAI, Intertek, or NFRC.
- .3 Qualifications:
 - .1 Fabricator shall have minimum of five years successful experience in fabrication and erection of metal entrances of similar sizes, shapes and finishes to units required for this project and shall have ample facilities to produce, furnish and supply units as required for installation without delay to Work.
- .4 Certifications:

- .1 Product certificates signed by manufacturer certifying materials comply with specified performance characteristics and criteria and physical requirements.
- .5 Preconstruction Testing:
 - .1 Certified test reports showing compliance with specified performance characteristics and physical properties.
- 1.7 DELIVERY, STORAGE, AND HANDLING**
 - .1 Storage and Protection:
 - .1 Apply temporary protective coating to finished surfaces. Remove coating after erection. Do not use coatings that will become hard to remove or leave residue.
 - .2 Leave protective covering in place until final cleaning of building.
 - .2 Packaging Waste Management
 - .1 Separate and recycle waste materials in accordance with Section 01 74 19 – Construction Waste Management.
- 1.8 WARRANTY**
 - .1 Provide manufacturer's written guarantee, signed and issued in name of Owner, to replace following items for defective material and workmanship for time stated from date of Substantial Performance:
 - .1 Framing, panels and glazing: failure of performance requirements; two years.
 - .2 Sealed glass units: misting, dusting and seal failure; ten years.
 - .3 Sealants, caulking: failure to maintain seal; two years.
 - .4 Aluminum brakeshapes: oil canning and delaminating; two years.
 - .5 Finishes: failure specified finishes not attributable to normal weathering: 20 years.
 - .2 Anodized Aluminum: Provide 2 year for Class II finishes and 5 years for Class 1 Finishes that metal will not change colour more than 5 DEcmc per AAMA 611 and finished metal will not crack, blister, check, or peel.

Part 2 Products

2.1 PERFORMANCE / DESIGN CRITERIA.

- .1 Design glass, framing members, and anchorage to the requirements of the Ontario Building Code for wind, seismic, guard, and human impact loads.
- .2 Where flush threshold doors are required, 330 Pa water resistance is unlikely. For these locations, "Limited water" (LW) rated doors are appropriate provided there is minimum 2:1 door height to overhang ratio protection extending in all directions from door frame.
- .3 Design frames and doors in exterior walls to:

- .1 Accommodate expansion and contraction within service temperature range of -35 to +35 degrees C.
- .2 Limit deflection of mullions to maximum 1/175th of clear span when tested to ASTM E330/E330M under wind load of 1.2 kPa. Submit certificate of tests performed.
- .3 Air Infiltration: For single acting offset pivot or butt hung entrances in the closed and locked position, the test specimen shall be tested in accordance with ASTM E283/E283< at a pressure differential of 75 Pa for single doors and 75 Pa for pairs of doors. A single 915 mm x 2134 mm entrance door and frame shall not exceed 0.2 L/s/sq m for fixed and 0.5 L/s/sq m for operable doors per NECB requirements.
- .4 Water Penetration Resistance: no leakage when tested to ASTM E331 or ASTM E547 to 500 Pa for fixed units and 300 Pa for doors.
- .4 Size glass thickness and glass unit dimensions to limits.
- .5 Provide continuous air barrier and vapour retarder through door system. Primarily in line with inside pane of glass and heel bead of glazing compound.

2.2 MATERIALS

- .1 Aluminum extrusions: Aluminum Association alloy AA6063-T5, T6, or T54 anodizing quality.
- .2 Sheet aluminum: Alloy 1100, F temper, 3 mm minimum thickness exposed sheet finished to match frames as specified.
- .3 Steel reinforcement: to CSA-G40.20/G40.21, grade 300 W, shop painted with zinc chromate primer, thickness as required to support imposed loads and in no case less than 4.8 mm thick.
- .4 Fasteners: aluminum, non-magnetic stainless steel, or other materials warranted by manufacturer to be non-corrosive and compatible with aluminum components of suitable size to sustain imposed loads. Do not use exposed fasteners except where unavoidable for application of hardware. Match finish of adjoining metal. Provide Phillips flat-head machine screws for exposed fasteners.
- .5 Door bumpers: black neoprene, entrance manufacturer's standard.
- .6 Door bottom seal: adjustable door seal of anodized extruded aluminum frame and vinyl weather seal, recessed in door bottom, closed ends, automatic retract mechanism when door is open.
- .7 Isolation coating: bituminous paint, acid and alkali resistant asphaltic paint in accordance with MPI Architectural Painting Specification Manual approved product listing.
- .8 Glazing materials: refer to Section 08 80 50 - Glazing.
- .9 Glass Gaskets: silicone as specified in Section 08 80 50 - Glazing.
- .10 Spacers for glazing, backpans/aluminum spandrels to be full length, purpose made, aluminum channels.
- .11 Sealant: Including primer, joint filler, as specified in Section 07 92 00 - Sealants.
- .12 Thermal separator: Polyvinylchloride, 50 Shore A durometer hardness +5.

2.3 ALUMINUM FRAMES

- .1 Exterior Aluminum Frame: As specified in Section 08 44 13 – Glazed Aluminum Curtain Walls.
- .2 Interior Aluminum Frame: As specified in Section 08 44 13 – Glazed Aluminum Curtain Walls.

2.4 ALUMINUM SWING DOORS

- .1 Aluminum doors fabricated of rigid extruded rectangular aluminum tube cut and welded together and with internal reinforcing at corners. Some manufacturers may have to modify their standard system to meet the minimum bottom rail size noted for standard door construction.
- .2 Doors 57.2 mm thickness with 88.9 mm top rail and 165.1mm bottom rail, standard interlock, meeting and 88.9 mm jamb stiles with triple glazed sealed unit safety glass, door sizes as scheduled. Door adapter shall be thermally broken.
 - .1 U-factor:
 - .1 combined door: 0.42 BTU/hr/ft²/F
 - .2 centre of glass: 0.23 BTU/hr/ft²/F
 - .2 Acceptable Materials:
 - .1 350T Insulpour, Kawneer Canada Ltd.
 - .2 Other materials are acceptable as long as they meet the minimum performance requirements provided by the door listed above.

2.5 HARDWARE MATERIALS

- .1 The following list of materials is intended to establish product quality and acceptable materials. Product substitutions will be considered when submitted in accordance with Section 01 62 00 –Product Options and Substitutions.

Hardware Item	Acceptable Manufacturers	Acceptable Materials
Locklatch: Lock function appropriate to room type listed in Schedule.	Adams Rite	4510
Cylinders	AR CAM	985 x 29 mm
Automatic Entrance Operator (All systems shall include switching network for card reader device, door locking interface, and push button actuator)	Besam Horton Gyro Tech Horton Hunter Keanne Munro Stanley	Power Swing 4000 LE GT-500 x SA1 4000 LE HA-8 360 Series Magic-Swing Visible LS

Hardware Item	Acceptable Manufacturers	Acceptable Materials
<hr/>		
Closers: Aluminum doors	Arrow	7000
	LCN	4040
	Norton	1601
	Sargent	350
Pull	Kawneer	Classic CO-12
Push	Kawneer	Classic CP-2
Butt Hinges	NRP	114 x 144 mm
	Kawneer	114 x 101 mm
Threshold	Kawneer	Butt Hung
Floor Stop		
Dome type to suit floor finish	Standard Metal	S100/S102
	Hagar	243F/241F
	Gallery	218/200

Additional miscellaneous hardware as listed in Hardware Schedule at the end of this section shall be commercial quality, matching hardware requirements established by named products above.

- .2 Panic Exit Devices: In accordance with BHMA A156.3, Grade One, listed and labelled by a testing and inspecting agency acceptable to Authorities Having Jurisdiction for panic protection, type and function as listed in Section 08 71 00 - Door Hardware.
- .3 Weather Stripping: Manufacturer's standard replaceable components, and as follows:
 - .1 Compression Type: Moulded neoprene meeting ASTM D2000 or moulded PVC meeting ASTM D2287.
 - .2 Sliding Type: Wool, polypropylene, or nylon woven pile with nylon fabric or aluminum-strip backing meeting AAMA 701/702.
- .4 Weather Sweeps: Manufacturer's standard exterior door bottom sweep with concealed fasteners on mounting strip.
- .5 Provide full height astragals on all double doors.
- .6 Provide all hardware of each type from one manufacturer.
- .7 Keying as indicated in Section 08 71 00 - Door Hardware.

2.6 ALUMINUM FINISHES

- .1 Clear Anodized: Exposed aluminum surfaces shall be Aluminum Association (AA) Architectural Class I, AA-M12C22A41, clear anodized matching Kawneer #14.
- .2 Isolation Coating
 - .1 Isolate aluminum from the following components, by means of isolation coating:
 - .1 Dissimilar metals except stainless steel, zinc, or white bronze.
 - .2 Concrete, mortar and masonry.
 - .3 Wood.
 - .3 Unexposed aluminum: Mill finish.

2.7 STEEL FINISHES

- .1 Finish steel clips and reinforcing steel with steel primer to CGSB 1.40.

2.8 ALUMINUM BRAKESHAPES

- .1 Shop laminate sheet aluminum to treated plywood backing over rigid insulation to profiles and sizes as indicated; Conceal plywood backing with aluminum.
- .2 Brake aluminum to profiles prior to painting and/or anodizing (except clear anodized anodic oxide finish).
- .3 Finish: To match window exterior exposed aluminum.

2.9 FABRICATION GENERAL

- .1 Doors and framing to be by same manufacturer.
- .2 Fit and assemble all Work in the shop insofar as practical.
- .3 Reinforce members and joints with steel plates, bars, rods or angles for rigidity and strength as needed to fulfill performance requirements. Use concealed stainless steel fasteners for jointing which cannot be welded.
- .4 Fit joints tightly and secure mechanically.
- .5 Provide cut-outs and integral reinforcing as required to receive hardware.
- .6 Separate unlike metals or alloys with a heavy coating of bituminous paint, separator gaskets or slip gaskets as required to prevent galvanic action.
- .7 Provide weepholes in glazing recess and an airseal at interior glassline.
- .8 Glazing to be held by pressure plate system with snap-on covers.
- .9 Glass fabrication specified under Section 08 80 50 - Glazing.

Part 3 Execution

3.1 EXAMINATION

- .1 Inspect Work and conditions affecting the Work of this Section. Proceed only after deficiencies, if any, have been corrected.
- .2 Construct flashings built-in or integrated with system to divert moisture to exterior.

- .3 Verify that anchor blocks or inserts required to receive system are correctly located and installed.
- .4 Verify that anchors and setting or installing components provided by this Section to others for installation are properly located and installed.
- .5 Verify that building air and vapour retarding membranes can be sealed to entrance units to maintain building envelope system integrity.

3.2 PREPARATION

- .1 Obtain all dimensions from the job site.
- .2 Provide data, dimensions and components, anchors and assemblies to be installed in proper time for installation.

3.3 INSTALLATION

- .1 Compliance: comply with manufacturer's written data, including product technical bulletins, product catalogue installation instructions, product carton installation instructions, and data sheets.
- .2 Install in accordance with the manufacturer's written instructions and the contract documents, plumb, true, level and rigid.
- .3 Seal door threshold to back angle with liquid sill membrane to continue up jambs 150 mm, in line with door adapter, seal door adapter to curtain wall mullion. Seal thermally broken door thresholds with air seal compression gasket.
- .4 Gun-apply three continuous beads of sealant under extruded aluminum thresholds. Make bead diameter sufficient to ensure a full width seal. Remove excess sealant.
- .5 Conceal all anchors and fitments. Exposed heads of fasteners not permitted. All joints in exposed work to be flush hairline butt joints.
- .6 Use anchors that will permit sufficient adjustment for accurate alignment. Make allowance for deflection of building structure.
- .7 Build in and provide any supplementary reinforcing and bracing required by assembly loads and deflections.
- .8 Secure Work adequately to structure in a manner not restricting thermal and wind movement. Make allowances for deflection of structure to ensure that structural loads are not transmitted to frames.
- .9 Correctly locate and install flashings, deflectors and weep holes and verify proper drainage of moisture to exterior.
- .10 Maintain alignment with adjacent Work.
- .11 Isolate aluminum surfaces from adjacent dissimilar materials and metals with coatings of bituminous paint.
- .12 Verify all stops, gaskets, splines, seals, etc. are perfectly aligned and ready to receive glazing and insulated panels as specified herein.
- .13 Install glazing to details and instruction, using material specified.
- .14 When a full mullion is used at perimeter framing, glazing, pocket may be stabilized for pressure plate with a block of rigid insulation.

- .15 Glazing stops, snap covers and pressure plates shall be of a continuous length from corner to corner, and be fitted at corners.
- .16 All preformed tapes or gaskets shall be of a continuous length corner to corner and shall be cut over length to prevent stretching. Joints, splices and corners shall be mitred and sealed.
- .17 Clean all contact surfaces of glazing with solvent and wipe dry. Verify all glazing channels are clean, true to line, and free of dirt or debris and that weep and drainage vents are open.
- .18 Rest glazing on setting blocks at 1/4 points.
- .19 Seal full perimeter of door lights to provide and maintain the designed air/vapour/thermal barrier integrity and weather tightness.
- .20 Pack fibrous insulation or low expansion foamed-in-place insulation in shim spaces at perimeter of assembly to maintain continuity of thermal barrier.
- .21 Hang doors using hardware scheduled. Adjust as required for proper operation.
- .22 Install weatherstrip to provide positive contact.
- .23 Install sealants and back-up materials in strict accordance with manufacturer's written instruction.
- .24 Make cut-outs for hardware i.e.: card readers and push buttons.

3.4 CLEANING

- .1 Perform cleaning of aluminum components in accordance with AAMA 609.1 - Voluntary Guide Specification for Cleaning and Maintenance of Architectural Anodized Aluminum.
- .2 Perform cleaning as soon as possible after installation to remove construction and accumulated environmental dirt.
- .3 Clean aluminum with damp rag and approved non-abrasive cleaner.
- .4 Remove traces of primer, caulking, epoxy and filler materials; clean doors and frames.
- .5 Clean glass and glazing materials with approved non-abrasive cleaner.
- .6 Upon completion of installation, remove surplus materials, rubbish, tools and equipment barriers.

END OF SECTION

Part 1 General

1.1 SUMMARY

- .1 Section Includes:
 - .1 Sectional door assembly.
 - .2 Standard duty industrial hardware.
 - .3 Windows.
 - .4 Electrical operator.
 - .5 Tracks and accessories.
- .2 Related Requirements:
 - .1 Section 05 50 00 – Metal Fabrications.
 - .2 Section 07 27 13 – Modified Bituminous Air and Vapour Barrier.
 - .3 Section 07 27 19 – Sheet Membrane Air and Vapour Barriers.
 - .4 Section 07 62 00 – Sheet Metal Flashing and Trim.
 - .5 Section 08 71 00 – Door Hardware.
 - .6 Section 09 91 00 – Painting.
 - .7 Division 26: Electrical power supply.

1.2 REFERENCES

- .1 Reference Standards:
 - .1 American Society for Testing and Materials International (ASTM):
 - .1 ASTM A653/A653M-23, Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.
 - .2 ASTM A1008/A1008M-23e1, Standard Specification for Steel, Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low-Alloy, High-Strength Low-Alloy with Improved Formability, Solution Hardened, and Bake Hardenable.
 - .3 ASTM D523-14 (2018), Standard Test Method for Specular Gloss.
 - .4 ASTM D822-23, Standard Practice for Filtered Open-Flame Carbon-Arc Exposures of Paint and Related Coatings.

- .5 Underwriters Laboratory (UL):
 - .1 UL 325, Door, Drapery, Gate, Louver, and Window Operators and Systems -2017.
 - .2 UL Subject 2985, Sustainability Outline Thermal Insulation. (Outline, 10/26/2015).
- .6 Underwriters Laboratory ECOLOGO Certification Program (UL):
 - .1 UL 2768, Architectural Surface Coatings (formerly CCD-047).
 - .2 UL 2760, Recycled Water-Borne Surface Coatings (formerly CCD-048).

1.3 ADMINISTRATIVE REQUIREMENTS

- .1 Pre-installation meeting: one week prior to beginning work of this Section and on-site installation, with Contractor, Consultant, installer, manufacturer's representative to:
 - .1 Verify project requirements.
 - .2 Review installation and substrate conditions.
 - .3 Co-ordination with other building subtrades.
 - .4 Review manufacturer's installation instructions and warranty requirements.

1.4 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Submit product data in accordance with Section 01 33 00 – Submittal Procedures:
 - .1 Submit manufacturer's printed product literature, specifications and datasheet.
 - .2 Door operator motor information indicating nameplate data and ratings, characteristics, and mounting arrangements.
 - .3 Provide electronic copy of WHMIS SDS - Safety Data Sheets in accordance with WHMIS acceptable to Labour Canada, and Health and Welfare Canada. Indicate VOC's:
 - .1 For caulking materials during application and curing.
 - .2 For door materials and adhesives.
- .2 Submit shop drawings in accordance with Section 01 33 00 – Submittal Procedures:
 - .1 Indicate sizes, service rating, types, materials, operating mechanisms, glazing locations and details, hardware and accessories, required clearances and electrical connections.
- .3 Manufacturer's Instructions: Submit manufacturer's installation instructions.
- .4 Manufacturer's Field Reports: submit copies of manufacturer's field reports.

- .5 LEED Submittals: provide LEED submittals in accordance with Section 01 61 01 - LEED Product Requirements.

1.5 CLOSEOUT SUBMITTALS

- .1 Provide operation and maintenance data for overhead door hardware for incorporation into manual specified in Section 01 78 00 - Closeout Submittals.

1.6 QUALITY ASSURANCE

- .1 Regulatory Requirements: electrical components, devices and accessories are listed and labelled by Canadian Standards Association (CSA).
- .2 Qualifications:
 - .1 Installer Qualifications: Company or person specializing in installation of sectional overhead doors with five years documented experience and approved by door manufacturer.
 - .2 Manufacturer: Obtain sectional overhead doors and component materials through one source from single manufacturer and as follows:
 - .1 Obtain operators from sectional overhead door manufacturer.
 - .2 Obtain controls from sectional overhead door manufacturer.
- .3 Certificates: product certificates signed by manufacturer certifying materials comply with specified performance characteristics and criteria and physical requirements.
- .4 Test Reports: certified test reports showing compliance with specified performance characteristics and physical properties.

1.7 DELIVERY, STORAGE, AND HANDLING

- .1 Packaging Waste Management
 - .1 Separate and recycle waste materials in accordance with Section 01 74 19 – Construction Waste Management.

1.8 WARRANTY

- .1 Provide manufacturer's ten year warranty against delamination of panels and three year warranty for operator (material and workmanship)

Part 2 Products

2.1 MANUFACTURERS

- .1 Basis-of-Design Materials:
 - .1 Thermatite T175, Richards-Wilcox Canada Inc.
- .2 Alternatives:
 - .1 Subject to compliance with requirements specified in this section and as established by the Basis of Design materials, manufacturers offering similar products that may be incorporated into the Work include the following:
 - .1 Assa Abloy.

- .2 Creative Door Services Ltd.
- .3 Cornell Iron.
- .4 Overhead Door Company.
- .5 Steel-Craft Door Products Ltd.

2.2 PERFORMANCE/DESIGN CRITERIA

- .1 Design Requirements:
 - .1 Design exterior door assembly to withstand windload of 1 kPa with a maximum horizontal deflection of 1/240 of opening width.
 - .2 Air Infiltration: Maximum rate not more than 0.25 L/s/m² at 25 kph and 0.4 L/s/m² at 40 kph when tested in accordance with ASTM E283/E283M.
 - .3 Design door assembly to withstand minimum 25 000 cycles per annum, and 5 years total life cycle.

2.3 MATERIALS

- .1 Overhead Door Panels: galvanized steel sheet to ASTM A653/653M commercial quality Z180 zinc coating.
- .2 Tracks and Accessories: coated (galvanized), cold rolled, commercial steel (CS) sheet, in accordance with ASTM A653/A653M, Z180 coating designation.
- .3 Primer: to CAN/CGSB-1.105-M91 for steel surfaces.
- .4 Insulation: rigid polyurethane containing no ozone depleting substances including CFC (Chlorofluorocarbon) or HCFC (Hydrochlorofluorocarbon).
- .5 Cable: multi-strand galvanized steel aircraft cable.

2.4 DOORS

- .1 Sectional Door Assembly: Metal/foam/metal sandwich panel construction, with EPDM thermal break and ship-lap design. Units shall have the following characteristics:
 - .1 Exterior Face Sheets: 0.48 mm core metal thickness:
 - .1 Colour: silver
 - .2 Surface: Manufacturer's standard ribbed.
 - .2 Interior Face Sheets: 0.41 mm core metal thickness:
 - .1 Colour: silver
 - .2 Surface: Manufacturer's standard ribbed.
 - .3 Panel Thickness: 45 mm
 - .4 End Stiles: 1.6 mm core metal thickness.
- .2 Install glazing for vision panels. Sizes and number of vision panels as indicated.
- .3 Assemble components by means of spot or arc welding or coated rivet system or adhesive and self tapping screws to manufacturer's recommendations.
- .4 Apply shop coat of primer after fabrication of door. Fabricate doors from prepainted steel stock.

2.5 HEAVY DUTY INDUSTRIAL HARDWARE

- .1 Track: standard lift hardware with 80 mm size minimum 2.66 mm core thickness galvanized steel track.
- .2 Track Supports: 2.3 mm core thickness continuous galvanized steel angle track supports.
- .3 Spring counter balance: heavy duty oil tempered torsion spring with manufacturers standard brackets.
 - .1 Drum: sized according to door size by manufacturers requirements, die cast aluminum.
 - .2 Shaft: 25 mm diameter galvanized steel.
- .4 Top roller carrier: galvanized steel minimum 3.04 mm thick adjustable.
- .5 Rollers: Steel rollers 73 mm diameter, with ten, 8 mm diameter ball bearings, 11 mm diameter roller axles and both inner and outer ball races of hardened steel. Length of roller stem as required.
- .6 Roller brackets: adjustable, galvanized steel, minimum 2.7 mm thick.
- .7 Hinges: heavy duty industrial 2.75 mm thick galvanized steel as recommended by manufacturer.
- .8 Cable: minimum 6 mm diameter galvanized steel aircraft cable.

2.6 WINDOWS

- .1 Windows: Double glazed insulating windows fabricated in accordance with CAN/CGSB 12.8, set in EPDM rubber or neoprene glazing channel, and as follows:
 - .1 Stops: Removable stops of same material as door section frames.
 - .2 Layout: Type and size indicated and in arrangement shown on Drawings.
 - .3 Glass:
 - .1 Clear Polycarbonate Plastic: to CAN/CGSB 12.12, Category II - 540 J impact resistance having a minimum light transmission of 80%.

2.7 PREFINISHED STEEL SHEET

- .1 Prefinished steel with factory applied silicone modified polyester (SMP).
 - .1 Class F1S.
 - .2 Colour: as indicated on Drawings.
 - .3 Specular gloss: 25-35 units +/-5 to ASTM D523 for matte finish.
 - .4 Coating thickness: dry film thickness not less than 0.9 mil to ASTM D4138.
 - .5 Resistance to accelerated weathering for chalk rating of eight, colour fade five units or less and erosion rate less than 20% to ASTM D2244 and ASTM D659.

2.8 ELECTRICAL OPERATOR

- .1 Electrical jack shaft side mounted operator.

- .2 Electrical motors, controller units, remote pushbutton stations, relays and other electrical components: to CSA approval.
- .3 Motor: Industrial Duty with horsepower as recommended by manufacturer, 208/230 volt three phase and as recommended by door manufacturer; with automatic reset thermal overload protection, high starting torque, continuous duty motor; separate from reduction mechanism; factory pre-wired motor controls, starter; rated for door size and usage classification.
- .4 Controller units with integral motor reversing starter, solenoid operated brake three heater elements for overload protection, including three pushbuttons and control relays as applicable.
- .5 Operation:
 - .1 Openers: 3 pre-programmed visor clip-on style operators per door, with one button to open and one button to close the door.
 - .2 Remote pushbutton stations: surface mounted, in two locations indicated on interior and exterior of building for each door, with "OPEN-STOP-CLOSE" designations on pushbuttons in English.
 - .3 Radio Control Station: One button radio control with three channel, universal coaxial receiver to open, close, and stop door; one per operator and remote antenna mounting kit.
 - .4 Cable control: pendant hung control to open and electric eyes to close.
- .6 Safety switch: in accordance with UL325, combination roll rubber with limit switches for full length of bottom rail of bottom section of door, to reverse door to open position when coming in contact with object on closing cycle.
- .7 For jack shaft operators:
 - .1 Provide floor level disconnect device to allow for manual operation in event of power failure.
 - .2 Equip Operator with:
 - .1 Electrical interlock switch to disconnect power to operator when in manual operation.
 - .2 Built-in chain hoist for manual operation in event of power failure.
- .8 Electrical Enclosures: Hinged enclosure cover, lockable in closed and open position and as follows:
 - .1 Location: wet areas.
 - .2 NEMA 4 enclosure rating in accordance with NEMA 250.
- .9 Automatic illumination complete with time delay, self extinguishing.
- .10 Door speeds: 300 mm per second.
- .11 Control transformer: for 24 VAC control voltage.
- .12 Mounting brackets: galvanized steel, size and gauge to suit conditions.
- .13 Obstruction Detection Device: Equip each motorized door with external automatic safety sensor capable of protecting full width of door opening; activation of sensor immediately stops and reverses downward door travel, in accordance with UL325 and as follows:

- .1 Pressure Sensor Edge: Self monitoring electrically actuated located within astragal or weather stripping mounted to bottom bar; contact with sensor immediately stops and reverses downward door travel, connect to control circuit using manufacturer's standard take up reel or self coiling cable.
- .2 Photoelectric Sensor: Reflective type system designed to detect an obstruction in door opening without contact between door and obstruction; interfaced with door operator control circuit to detect damage to or disconnection of sensing device; non-responsive to ambient light.
- .14 Acceptable Materials:
 - .1 Chamberlain Lift-Master, Inc.
 - .2 Doorlec Corporation.
 - .3 Lynx Industries Inc.
 - .4 Manaras Commercial Operators.

2.9 ACCESSORIES

- .1 Overhead horizontal track and operator supports: galvanized steel, type and size to suit installation.
- .2 Track guards: 5 mm thick formed sheet 1500 mm high track guards.
- .3 Pusher springs.
- .4 Handles: operated from inside.
- .5 Weather stripping: heavy duty, factory installed continuous top seal to seal against header, continuous co-polymer joint bulb seal between sections and vinyl bulb shaped astragal on the bottom edge of the door
- .6 Finish ferrous hardware items with minimum zinc coating of 300 g/m² to CSA G164.

Part 3 Execution

3.1 INSTALLATION

- .1 Compliance: comply with manufacturer's written data, including product technical bulletins, product catalogue installation instructions, product carton installation instructions, and data sheets.
- .2 Install doors and hardware in accordance with manufacturer's instructions.
- .3 Rigidly support rail and operator and secure to supporting structure. Provide steel/metal support components to connect to structure shown on detailed drawings.
- .4 Touch-up steel doors with primer where galvanized finish damaged during fabrication.
- .5 Install operator including electrical motors, controller units, pushbutton stations, relays and other electrical equipment required for door operation.
- .6 Lubricate and adjust door operating components to ensure smooth opening and closing of doors.
- .7 Adjust weatherstripping to form a weather tight seal.

- .8 Adjust doors for smooth operation.

3.2 FIELD QUALITY CONTROL

- .1 Have manufacturer of products supplied under this Section review Work involved in handling, installation/application, protection and cleaning of its products, and submit written reports in acceptable format to verify compliance of Work with Contract.
- .2 Manufacturer's field services: provide manufacturer's field services consisting of product use recommendations and periodic site visits for inspection of product installation in accordance with manufacturer's instructions.
- .3 Schedule site visits to review Work at stages listed:
 - .1 After delivery and storage of products, and when preparatory Work on which Work of this Section depends is complete, but before installation begins.
 - .2 Twice during progress of Work at 25% and 60% complete.
 - .3 Upon completion of Work, after cleaning is carried out.
- .4 Obtain reports within three days of review and submit.

3.3 CLEANING

- .1 Perform cleaning after installation to remove construction and accumulated environmental dirt.
- .2 Remove traces of primer, caulking; clean doors and frames.
- .3 Clean glass and glazing materials with approved non-abrasive cleaner.
- .4 Upon completion of installation, remove surplus materials, rubbish, tools and equipment barriers.

END OF SECTION

Part 1 General

1.1 SUMMARY

- .1 Section Includes conventionally glazed aluminum curtain walls installed as stick built systems consisting of; but not limited to, the following:
 - .1 Fixed, clear, low emissivity (Low E) sealed glass units.
 - .2 Full length pressure plate system
 - .3 Dry glazed from exterior with screw on pressure plate, keyed-in neoprene gasket and thermal break.
 - .4 Internal weep drainage and compartmentalization in accordance with established design principles for rain screen and pressure equalization in curtain wall systems.
 - .5 Snap-On covers.
- .2 Drawings contain details that suggest directions for solving some of the major design requirements; these details can be developed further by the Contractor provided that the final installation adheres to aesthetic criteria established by the drawings and specified dimensions with all elements in planes as drawn, maintaining their relationships with all other building elements.
- .3 Related Requirements:
 - .1 Section 01 35 00 – Delegated Design.
 - .2 Section 05 50 00 – Metal Fabrications: Metal fabricated attachment devices, and framed openings.
 - .3 Section 06 10 00 – Rough Carpentry.
 - .4 Section 07 21 19 – Foam-In-Place Insulation.
 - .5 Section 07 27 13 – Modified Bituminous Air and Vapour Barrier.
 - .6 Section 07 27 19 – Sheet Membrane Air and Vapour Barriers.
 - .7 Section 07 62 00 – Sheet Metal Flashing and Trim.
 - .8 Section 07 92 00 – Sealants.
 - .9 Section 08 11 16 – Aluminum Doors and Frames.
 - .10 Section 08 80 50 – Glazing.
 - .11 Section 09 21 16 – Gypsum Board Assemblies.

1.3 ADMINISTRATIVE REQUIREMENTS

- .1 Coordination: Coordinate installation of system with work specified in other Sections to ensure proper placement and installation of vapour barrier, insulation and flashing in order that air, vapour and thermal barrier of building is intact and moisture will be diverted to the exterior, and as follows:
 - .1 Coordinate installation of sealants so that ambient and surface temperatures are greater than 5°C from time of application until sealants have cured.
 - .2 Coordinate connection of curtain wall system structural connections at floor slabs to vertical members.
 - .3 Coordinate Work of this Section with installation of firestopping, installation of ductwork to rear of louvres, and adjacent components or materials.

- .2 Pre-installation Meetings: Convene pre-installation meeting one week prior to beginning work of this Section and on-site installation, with Contractor, Consultant, installer, manufacturer's representative in accordance with Section 01 31 19 – Project Meetings to:
 - .1 Verify project requirements, substrate conditions, manufacturer's installation instructions, and manufacturer's warranty requirements;
 - .2 Review location and alignment of vertical and horizontal elements as they relate to the aesthetic criteria indicated on the Drawings, and the technical requirements indicated on the shop drawings.

1.4 ACTION SUBMITTALS / INFORMATION SUBMITTALS

- .1 Submit product data in accordance with Section 01 33 00 – Submittal Procedures:
 - .1 Submit manufacturer's printed product literature, specifications and technical data sheet.
 - .2 Submit product data indicating construction details, material descriptions, dimensions of individual components and profiles, finishes, anchorage and fasteners, glass and infill, internal drainage details.
 - .3 Provide electronic copy of WHMIS SDS - Safety Data Sheets.
- .2 Submit shop drawings in accordance with Section 01 33 00 – Submittal Procedures:
 - .1 Delegated Design: Submit shop drawings, signed and sealed by the delegated design engineer, detailing fabrication and assembly of glazed aluminum curtain wall systems clearly indicating all construction details including; but not limited to, the following:
 - .1 Fully dimensioned layouts for positioning of secondary support members and anchorage of tie-back devices to structures;
 - .2 Large scale details of members and materials, of brackets and anchorage devices and of connection and jointing details;
 - .3 Include thermal values and weathertightness rating data.
 - .4 Fully dimensioned layouts for positioning of brackets and anchorage devices to structures;
 - .5 Dimensions, gauges, thicknesses;
 - .6 Type, size and spacing of fastening devices;
 - .7 Glazing details;
 - .8 Air/vapour barrier details, acoustic control details, aluminum alloy and temper designations, metal finishing specifications and other pertinent data and information;
 - .9 Internal drainage;
 - .10 Show details of perimeter and interface connecting work of this section with work of adjacent sections.
- .3 Submit samples in accordance with Section 01 33 00 – Submittal Procedures:
 - .1 Submit samples of materials for Consultant's verification of specified finishes including; but not limited to, the following:
 - .1 300 mm x 300 mm for sheets, plates and glass;

- .2 300 mm long for extrusions and formed or rolled shapes;
 - .3 300 mm long for tapes and gaskets;
 - .4 150 mm long for sealants;
 - .5 Samples shall fully represent physical and chemical properties, finish, and colours of materials to be supplied.
- .2 Submit a sample of each finish hardware item that is to be supplied under this section.
- .3 Submit two samples 610 x 610 mm in size illustrating window frame section, insulation, vapour barrier, glass, spandrel panels, vents and sealant.
- .4 Delegated Design Submittals: Submit letters of commitment and compliance in accordance with Section 01 35 00 – Delegated Design Submittals as follows:
 - .1 Provide Letter of Commitment in conjunction with shop drawings, signed and sealed by the professional engineer required by the Work of this Section indicating the following are designed to the intent of the Building Code:
 - .1 Curtain wall connections to building structure.
 - .2 Curtain wall reinforcement.
 - .3 Deflection of members.
 - .4 Glass thickness as it relates to glass area.
 - .2 Provide Letter of Compliance, signed and sealed by the professional engineer required by the Work of this Section indicating that connections, reinforcement and deflection criteria, and glass thickness of installed system is in compliance with the intent of the Building Code and reviewed shop drawings before declaration of Substantial Performance.
 - .3 Calculations:
 - .1 Submit complete design study calculations, certified by a professional engineer licensed to design structures and registered in the jurisdiction of the Place of the Work, including pertinent information affecting design, wind reactions, shading effects and failure probability for thermal glazing units and spandrel panels, to Consultant as evidence of compliance with design criteria, prior to manufacture.
 - .2 Pressure equalized rain screen (PER) design: calculations to include the following:
 - .1 Pressure equalization during exposure to the design wind pressures and gusts;
 - .2 PER design provides pressure equalization of the cavity compartments within 0.5 seconds.
 - .4 Sealant Data:
 - .1 Submit product information on the sealants to be used, complete with all recommendations and installation instructions, including cleaning and priming procedures.
 - .2 Submit sealant manufacturer's test reports on adhesion to metal and glass production samples tested in accordance with ASTM

- C794, seven day cure and seven day water submersion, tensile strength at 100% elongation and bite size of sealants.
- .3 Submit sealant manufacturer's statement and test data indicating that stress on the sealants when exposed to maximum load does not exceed 38 kPa and a safety factor of 5:1.
- .4 Submit sealant manufacturer's compatibility statement that all materials in contact with the sealants are compatible with the sealants in accordance with procedures of ASTM C1087.
- .5 Submit sealant manufacturer's verification that sealants are suitable for purposes intended.
- .5 Submit copies of test reports to establish that products used comply with air leakage and water penetration performance requirements. Submit test reports or calculations to establish that products used comply with energy performance criteria. Submit test reports to establish that products used comply with condensation resistance criteria. Energy and condensation calculation reports to be submitted under the seal of a Professional Engineer in the Province of the Work.

1.5 CLOSEOUT SUBMITTALS

- .1 Provide operation and maintenance data for incorporation into manual specified in Section 01 78 00 - Closeout Submittals and as follows:
 - .1 Submit data for cleaning of aluminum finishes and maintenance of operational hardware.
 - .2 Instruction for replacement of glass units (insulating and structural glass).
- .2 LEED Submittals: provide LEED submittals in accordance with Section 01 61 00.

1.6 QUALITY ASSURANCE

- .1 Obtain door and curtainwall materials from single manufacturer and/or ensure materials ordered and supplied are compatible with one another.
- .2 Qualifications: The firm producing and executing the Work of this Section shall have a minimum of five years successful experience in the fabrication and erection of systems of similar sizes, shapes and finishes to the units required for this project and shall have ample facilities to produce, furnish and supply the units as required for installation without delay to the Work.
- .3 Delegated Design Professional: Retain a Professional Engineer, registered in the Province of the Work, to design fabrication and erection of the Work of this Section in accordance with applicable Building Code and Contract Documents requirements including, but not limited to, the following:
 - .1 Seal and signature to shop drawings and design submittals.
 - .2 Site review of installed components.
- .4 Provide Tests in Accordance with Section 01 45 00 – Quality Control:
 - .1 Initial Test: Complete diagnostic water leakage field checks of the primary gasket and wet seals of the curtain wall systems to AAMA 501.2, prior to application of secondary seals and caps.

- .2 Static Pressure Air Exfiltration Smoke Test to ASTM E283, Standard test method for Rate of Air Leakage (6.24 psi with a leakage rate of <0.03 cfm/ft²), provide one test.
- .3 Static Pressure Water Infiltration: ASTM E331 Standard Test Method for Water Penetration by Uniform Static Air Pressure Difference. A minimum 15 minute wait period shall be included after this and each subsequent water penetration test.
- .4 Pressure differential for water field testing to ASTM E1105 at 750 Pa.
- .5 Dynamic Pressure Water Infiltration: AAMA 501.1 Standard Test Method for Exterior for Water Penetration using Dynamic Pressure. Include two setups.
- .5 Mock-Ups
 - .1 Construct mock-ups in accordance with Section 01 45 00 - Quality Control.
 - .2 Provide 3000 x 3000 mm mock-up including intermediate mullion, corner mullion, sill muntin, vision glass light, and insulated infill panel glass. Assemble to illustrate component assembly including glazing materials, weep drainage system, attachments, anchors, and perimeter sealant.
 - .3 Mockup to include sloped glazed system and junction with vertical curtain wall and other vertical work mullions, muntins, structural member covers, vision glass light, and insulated panel and glass. Assemble to illustrate component assembly including glazing materials, weep drainage system, attachments, anchors, and perimeter sealant.
 - .4 Locate where directed.
 - .5 Allow 24 hours for review of mock-up by Consultant before proceeding with work.
 - .6 When accepted, mock-up will demonstrate minimum standard for this work. Mock-up may remain as part of finished work.

1.7 DELIVERY, STORAGE, AND HANDLING

- .1 Comply with AAMA CW-10 for care and handling of all aluminum Products through the entire manufacturing, finishing, fabrication, delivery and installation phases.
- .2 Protect metal and metal finishes to prevent damage during fabrication, storage, shipping, handling and installation.
- .3 Protect insulating glass units during shipment. Repair or replace damaged components or units as required to meet Contract requirements, and replace any gas leakage during shipping to specified concentrations.
- .4 Deliver, handle and store units by methods approved by manufacturer. Store units at site on wood platforms raised above grade or in enclosures protected from elements and corrosive materials. Stack units vertically in manner to prevent racking. Do not remove from crates or other protective covering until ready for installation.
- .5 Packaging Waste Management
 - .1 Separate and recycle waste materials in accordance with Section 01 74 19 – Construction Waste Management.

1.8 SITE CONDITIONS

- .1 Site Measurements: Verify dimensions of other construction by site measurements before fabrication and indicate measurements on shop drawings where aluminum curtain wall systems are indicated to fit to other construction.
- .2 Established Dimensions: Establish dimensions and proceed with fabricating aluminum curtain wall without site measurements where site measurements cannot be made without delaying the Work, coordinated with other construction to ensure that actual dimensions correspond to established dimensions.
- .3 Ambient Conditions: Confirm installation requirements for ambient and surface temperatures of sealants with manufacturer and apply sealants when temperatures are greater than manufacturer's stated minimum from time of application until sealants have cured.

1.9 WARRANTY

- .1 Provide manufacturers written guarantee, signed and issued in the name of Owner, to replace the following items for defective material and workmanship for the time stated from date of Substantial Performance:
 - .1 Framing, panels and glazing: failure of performance requirements specified in Contract Documents; ten years.
 - .2 Sealed glass units: misting, dusting and seal failure; ten years.
 - .3 Sealants, caulking: failure to maintain seal; two years.
 - .4 Aluminum brake shapes: oil-canning and delaminations; two years.
- .2 Anodized Aluminum: Provide 2 year for Class II finishes and 5 years for Class 1 Finishes that metal will not change colour more than 5 DEcmc per AAMA 611 and finished metal will not crack, blister, check, or peel.
- .3 Provide Warranty for aluminum windows to include in maintenance manuals as specified in Section 01 78 00 – Closeout Submittals.

Part 2 Products

2.1 MANUFACTURERS

- .1 Acceptable Manufacturers: Subject to compliance with requirements specified in this Section and as established by the Basis-of-Design Materials, manufacturers offering products that may be incorporated into the Work include; but are not limited to, the following:
 - .1 Alumicor
 - .2 Aluprof
 - .3 Schüco

2.2 PERFORMANCE/DESIGN CRITERIA

- .1 General Performance: Comply with performance requirements specified, as determined by testing of glazed aluminum curtain walls representing those indicated for this Project without failure due to defective manufacture, fabrication, installation, or other defects in construction.

- .1 Glazed aluminum curtain walls shall withstand movements of supporting structure including, but not limited to, story drift, twist, column shortening, long-term creep, and deflection from uniformly distributed and concentrated live loads. Failure also includes the following:
 - .1 Thermal stresses transferring to building structure.
 - .2 Glass breakage.
 - .3 Loosening or weakening of fasteners, attachments, and other components.
- .2 Retain a professional engineer registered in province of Work, experienced in structural design in glass and aluminum window units, connections to door units and connections to building, to ensure the adequacy of the structural aspects of the design, manufacture, and installation of complete assembly. Verify site specific thermal values and weather tightness data.
- .3 Design and size components to withstand dead and live loads caused by pressure and suction of wind, acting normal to plane of system as calculated in accordance with Climatic Data for one/50 year occurrence included in Building Code as measured in accordance with AAMA CW 11 and ASTM E330/E330M.
- .4 Design and size components to withstand seismic loads and sway displacement as calculated in accordance with NBC.
- .5 Limit mullion deflection to flexure limit of glass; with full recovery of glazing materials.
- .6 Size glass units and glass dimensions to limits established in CAN/CGSB-12.20.
- .7 Provide system to accommodate, without damage to components or deterioration of seals:
 - .1 Movement within system.
 - .2 Movement between system and perimeter framing components.
 - .3 Dynamic loading and release of loads.
 - .4 Deflection of structural support framing.
 - .5 Shortening of building concrete structural columns.
 - .6 Creep of concrete structural members.
- .8 Limit air infiltration through assembly to 0.15 L/sm² of wall area, measured at a reference differential pressure across assembly of 300 Pa as measured in accordance with ASTM E283/283M.
- .9 Vapour seal with interior atmospheric pressure of 25 mm sp, 22 degrees C, 40% RH: No failure.
- .10 Water leakage: none, when measured at a test pressure of 750 Pa in accordance with ASTM E331.
- .11 System to provide for expansion and contraction within system components caused by a cycling temperature range of -25 to 70 degrees C over a twelve hour period without causing detrimental affect to system components.
- .12 Drain water entering joints, condensation occurring in glazing channels, or migrating moisture occurring within system, to the exterior by a weep drainage network.

- .13 Maintain continuous air barrier and vapour retarder throughout assembly, primarily in line with inside pane of glass and heel bead of glazing compound. Position thermal insulation on exterior surface of air barrier and vapour retarder.
- .14 Ensure no vibration harmonics, wind whistles, noises caused by thermal movement, thermal movement transmitted to other building elements, loosening, weakening, or fracturing of attachments or components of system occur.
- .15 Reinforce curtain wall system to accommodate window washing guide rails. Provide anchors sufficiently rigid to resist loads caused by equipment platform, without damage to wall system.
- .16 Tolerances:
 - .1 Design and install the curtain wall to accommodate tolerances of related work not included in this section. This requirement is in addition to building structure movements and deflections.
 - .2 Fabricate components to provide a plumb, square, level and true installation, and to accommodate allowable tolerances for work of other sections upon which work of this section depends.
 - .3 Erection tolerances for frame assemblies relate to the structural grid of the building, and apply to each individual assembly as follows:
 - .1 vertical position: +3 mm;
 - .2 horizontal position: +3 mm;
 - .3 deviation from plumb: 3 mm maximum each plane;
 - .4 racking of face: 6 mm maximum;
 - .5 racking in elevation: Nil;
 - .6 offset from true alignment between two identical members abutting end to end in line: 0.8 mm;
 - .7 tolerances shall not be accumulative;
 - .8 erection tolerances for operable elements: consistent with smooth operation and weatherproof performance.

2.3 MATERIALS

- .1 Extruded aluminum: Alloy and temper recommended by glazed aluminum curtain wall manufacturer for strength, corrosion resistance, application of required finish and complying with ASTM B221, Aluminum Association (AA) alloy 6063-T5 or 6063-T6.
- .2 Aluminum sheet (exposed): to ASTM B209/B209M, Aluminum Association (AA) alloy 1100, anodizing quality.
- .3 Aluminum sheet (unexposed): utility sheet to CSA HA-Series 6063 alloy, T5 temper.
- .4 Steel Reinforcement: to CSA G40.20/G40.21, 300W hot dipped galvanized after fabrication to ASTM A653/A653M, minimum coating of 600 g/m² shapes to suit mullion sections.
- .5 Aluminum welding: to CSA W59.2.
- .6 Stainless steel: to ASTM A480/A480M, Type 304 or 316; of one type throughout.

- .7 Anchors: adjustable T-anchors located top and/or bottom of mullions. Anchors cannot interfere with membrane to tube face connection.
- .8 Pressure Plate: aluminum plate, fastened to the mullion with stainless steel screws.
- .9 Glass: Clear, as indicated in window schedule, sealed glass units as specified under Section 08 80 50 – Glazing.
- .10 Fasteners: Fasteners: aluminum, non-magnetic stainless steel, or other materials warranted by manufacturer to be non-corrosive and compatible with aluminum components of suitable size to sustain imposed loads. Do not use exposed fasteners except where unavoidable for application of hardware. Match finish of adjoining metal.
- .11 Anti-Rotation Channels: non-metallic anti-rotation channel designed to mechanically retain air seal membrane to the face of the tubular back section.
- .12 Anti-Rotation Blocking: 40 psi high density polyurethane foam cut to fit.
- .13 Primer for adhesives: as recommended by the adhesive manufacturer for the materials to be adhered.
- .14 Thermal separators (thermal break): of size to conform to the extruded aluminum members or other locations where required, neoprene, EPDM or polyvinyl chloride and having a minimum tensile strength of (14 MPa) (2000 psi) and Durometer A Hardness of 60, +/- 5.
- .15 Concealed Flashing: Manufacturer's standard corrosion resistant, non-staining, non-bleeding flashing compatible with adjacent materials.
- .16 Gaskets: silicone or manufacturers standard gasket.
- .17 Isolation coating: alkali resistant bituminous paint.
- .18 Insulation for packing into voids and cavities: Lightweight resilient, inorganic fibrous glass having a nominal density of 11 kg/cu.m.
- .19 Waterproofing sheet membrane at coping: as indicated in Section 07 27 13 – Modified Bituminous Air and Vapour Barriers.
- .20 Flexible flashing, flexible air/vapour retarder: silicone sheet
 - .1 Basis-of-Design Materials:
 - .1 Dowsil 123, Dow
- .21 Setting Blocks: silicone to 50-80 durometer A hardness.
- .22 Glazing Tape: continuous polyurethane bond breaker tape compatible with silicone sealant.
 - .1 Basis-of-Design Materials:
 - .1 Thermabond V-2100, Norton.
- .23 Sheet metal air/vapour barrier to be bonded to glazing frame and extended behind mounting frame. Seal to maintain continuity of seal. Install flexible flashing with continuous metal retaining strip to lap to interior wall assembly.

- .1 Sheet metal for metal air/vapour barriers and air seals:
ASTM A653 / A653M, minimum 0.91 mm sheet steel, galvanized,
stretcher-levelled, minimum coating weight 380 g/m². Provide stiffeners
as required.
- .24 Provide insulated interior mullion extensions to fit to interior partitions and
columns.
- .25 Sealants (including primer, joint filler): as specified in section 07 92 00 - Sealants
and as follows:
 - .1 Sealants used in structural joints shall have adequate strength to retain
insulating units to the metal framing under design conditions.
 - .2 Sealants shall be from the same manufacturer for all work of this section.
 - .3 Materials used in the work shall be resistant to rodents, vermin, mildew,
fungus and algae.
 - .4 Components in contact with opacifying coat at spandrel panels:
 - .1 Contact the opacifying coating manufacturer for confirmation of
compatibility of sealant to the coating;
 - .2 Use neutral cure silicone components only in spandrel cavity. Do
not use neoprene gaskets or setting blocks etc;
 - .3 Contact the opacifying coat manufacturer for a list of approved
compatible list of sealants and materials, and tapes and gaskets;

2.4 FRAMING SYSTEM: STICK BUILT

- .1 Exterior Fixed Window Frame: To profiles indicated and as required to fulfill
performance requirements, nominal thickness 2.5 mm, suitable alloy and proper
temper for extruding and adequate structural characteristics; and suitable for
finishing as specified:
 - .1 Back Frame Profile: Nominal 186 mm, mullion depth as indicated.
 - .2 Cap Profile: nominal 19 mm snap cap depth and nominal 63.5 mm high.
 - .3 Total Frame Depth: Mullion depth profile and snap cap depth added to
glazing throat/thermal break width.
- .1 Acceptable Materials:
 - .1 [ThermaWall 2600 Series, Alumatic.](#)
 - .2 [HP3253 Series, triple glazed, CRL/US Aluminum.](#)
 - .3 [7550 Series](#), Kawneer Canada Ltd.

2.5 OPERABLE UNITS

- .1 Provide thermally broken operable windows with screw adjustable opening
restrictors to limit swing of ventilators, set to a maximum 100 mm opening.
 - .1 Acceptable Materials:
 - .1 Alumatic
 - .2 [GLASSvent UT](#), Kawneer Canada Ltd.
 - .3 [7600 Series, CRL/US Aluminum](#)

2.6 GLAZING AND ACCESSORIES

- .1 Triple Pane Insulating Glass Units: Refer to Section 08 80 50 – Glazing.

2.7 INSULATED SPANDREL PANELS

- .1 Spandrel Glass: triple glazed in accordance with Section 08 80 50 - Glazing.
- .2 Back Pan: Galvanized steel in accordance with ASTM A653/A653M, 0.91 mm base metal thickness, formed into a pan shape to fit into glazing throat with back of pan flush with inside face of back section.
- .3 Insulation: Semi-rigid mineral fibre insulation with reinforced foil facing, held in place with manufacturer's standard fixing system to back face of back pan.
 - .1 Basis-of-Design Materials:
 - .1 Curtainrock 80, Rockwool Inc.

2.8 FABRICATION: GENERAL

- .1 Do not start fabrication until samples, shop and erection drawings have been reviewed and have been approved.
- .2 Execute fitting and assembly in the shop, insofar as practical, with the various parts or assemblies ready for erection at the building site.
- .3 Where possible, take field measurements and levels required to verify or supplement those shown on the drawings for the proper layout and installation of the work. Coordinate dimensional tolerances in adjacent building elements and confirm prior to the commencement of the Work.
- .4 Weld aluminum, where required, with inert metal arc equipment. Welders to qualify according to CSA W47.2. Make exposed welds continuous and flush with adjacent surface. Do not mar surface finishes with welds in back of exposed aluminum. Do not deform the exposed metal and finish way by welding.
- .5 Weld steel, where required, to CSA W59. Welded joints to be of adequate strength and durability with jointing tight and flush. Welders to be fully approved by the Canadian Welding Bureau and to comply with CSA W47.1. Where it is necessary to weld components already galvanized, remove galvanizing for 50 mm around weld.
- .6 In locations where curtain wall framing extends up to top of roof parapets, the headrail and glazing cap shall be reinforced to withstand force from window cleaner's suspension chair ropes, which will extend over the top of the parapet and down the face of the building.
- .7 Make provisions in doors and frames to suit requirements of electrically operated hardware and security devices, as applicable, provided under other trades or sections. Blank, drill, reinforce and tap to receive hardware, security and electrical devices. Provide removable plates or knockouts for electrical contacts. Provide fish wires as required.
- .8 Visible manufacturer's identification labels not permitted.

2.9 FABRICATION: FRAMING MEMBERS

- .1 Fabricate members to the profiles shown on the Drawings. Wall thickness of extrusions to be as required to meet the design requirements. Frames that are to receive insulating glass units shall have a continuous thermal break.
- .2 Accurately machine file and fit, and rigidly frame together joints, corners and mitres. Match components carefully to produce perfect continuity of line and design. Make exterior joints weathertight and interior joints airtight in accordance with specified allowances. Metal in contact to have hairline joints. Locations of exposed joints to be subject to the approval of the Consultant.
- .3 Sill Trim: Provide continuous extruded "U" trim to inside of bottom rail at each level with provision for receiving steel base and convector covers, as detailed
- .4 Reinforce frames and assemblies by concealed means as necessary to meet the specified design requirements and as shown. Reinforcing to be hot-rolled mild steel and be securely anchored to horizontal and vertical members by approved positive mechanical means.
- .5 Seal hairline joints at junctions of frame members. Gun-inject sealant from inside ensuring a continuous seal of the joint. Ensure that bead in the glazing space does not impair seating of glazing materials. Remove excess sealant which is forced onto face of frame assembly.
- .6 Location of joints and pressure equalizing drain vents to be subject to consultant's acceptance.
- .7 Provide sheet continuous air/vapour barrier between framing and building structure. Overlap corner joints. Apply barriers and retain with continuous aluminum or galvanized steel plates or bars and non-corrosive mechanical fasteners. Where indicated, fill void between frame and other building components solid with foamed in place polyurethane foam insulation.
- .8 Develop drainage holes with moisture path to exterior.
- .9 Prepare components to receive anchor devices. Fabricate anchorage items.
- .10 Arrange fasteners, attachments, and jointing to ensure concealment from view.
- .11 Cope, notch and drill so as to provide minimum tolerance throughout system and to fit with hairline joints.
- .12 Conceal interconnecting members and fastenings in completed assembly. Provide pressure equalizing holes in members and condensation drains.
- .13 Backup panels, framing members and associated sealing shall combine to form air tight vapour barrier for entire interior skin of curtain wall system. Cooperate and coordinate with other sections to ensure continuous thermal and air barrier seal at interfaces with adjacent materials. Insulate backpans with 75 mm thick semi-rigid mineral wool insulation.
- .14 Provide for vertical expansions and construction joints as necessary and install air cut-offs in continuous vertical members to prevent stack effect of enclosed air columns.
- .15 Jointing and intersections of metals shall be accurately cut, fitted to a tolerance of 0.8 mm, in true planes with adequate concealed beads where required.

- .16 Fabricate expansions joints between mullion sections with formed extruded aluminum internal sleeve sections, secure to permit joint function and maintain true alignment of sections.
- .17 Fabricate sections to accommodate and interface with work of other sub-contractors by means of rabbets, interlocks, miscellaneous angles, trim and filler sections as required.
- .18 Fabricate mullions not less than one storey height with fully fashioned expansion joints adequate for expansion and contraction required. Avoid chimney effect inside mullions by stopping voids at each floor level with packing consisting of rigid insulation.
- .19 Brake form parapet caps and sills out of 3 mm thick aluminum sheet.
- .20 Reinforce mullions with structural steel sections where required with adequate anchorage to structure.
- .21 Provide internal reinforcement in horizontal window mullions to satisfy wind loads and to maintain rigidity.
- .22 Perform fitting and assembly of component parts in shop insofar as practicable. Work that cannot be permanently shop assembled shall be fitted, assembled, marked and disassembled to assure proper fitting in field. Identify shop assembled components on shop drawings for location and erection at site.
- .23 Isolate aluminum in contact with other metals, masonry, concrete, plaster or mortar to prevent corrosion.
- .24 Verify wall openings and adjoining air and vapour seal materials are ready to receive work of this section.
- .25 Beginning installation means acceptance of site conditions.
- .26 Provide airtight vapour seals in curtain wall framing.

2.10 FABRICATION: SPANDREL PANELS/FLASHING/ACCESSORIES

- .1 Refer to Drawings for size type and location of glass spandrel panels.
- .2 Spandrels to have insulated backup panels, complete with 75 mm thick insulation consisting of two layers. Secure insulation to metal liner with adhesive and "spindle" clips with black retainer discs, minimum two per board.
- .3 First layer of insulation to be 50 mm thick impaled on clips and secured with retainer discs. Second layer to be black-faced, secured to first with adhesive, uniformly spread over opposing faces. Align panels symmetrically with joints in line and tight together. Cut off ends of spindles just above discs, It is imperative that joints are tight so that edges do not show, if misaligned, caulk with black sealant. Similarly caulk perimeter edges. Appearance from outside shall be a consistent black colour.
- .4 Provide 3 mm thick aluminium shadow box sheet secured to framing in front of insulation.
- .5 Seal perimeter of liner panels with non-permeable sealant to maintain vapour barrier. Install weatherseal, rain deterrent and vent where detailed and required.
- .6 Reinforce liner panels where necessary to prevent undue deflection.

- .7 Provide sloping sills with high backs, to terminate curtain wall system at bottom. Brake form to detailed profiles.
- .8 Fabricate panels in manner to maintain complete thermal and vapour barrier seal at inner panel, yet to ensure moisture is drained to exterior.
- .9 Form aluminum flashing, parapet coping and cap flashing as detailed and to locations indicated. Prevent damage by window washing equipment, ladders, etc., by reinforcing edges of copings and caps.
- .10 Provide sound baffles within spandrels to reduce noise transmission vertically between floors.

2.11 FINISHES

- .1 Clear Anodized: Exposed aluminum surfaces shall be Aluminum Association (AA) Architectural Class I, AA-M12C22A41, clear anodized matching Kawneer #14.
- .2 Steel exposed to exterior conditions that is on cold-in-winter side of air/vapour barrier, but not exposed to view, shall be blast cleaned and hot dip galvanized in accordance with CSA G164, minimum coating mass 381 g/m². Thread dimensions to be such that nuts will thread over bolts without re-threading or chasing galvanized threads.
- .3 Galvanize after fabrication where possible. Follow standard precautions to avoid making the base metal brittle by over pickling, overheating or during galvanizing.
- .4 Shop and touch-up primer for steel components: SSPC 25 Paint red oxide.
- .5 Touch-up primer for galvanized steel surfaces: SSPC 20 Paint zinc rich.
- .6 Concealed steel items: galvanized in accordance with CSA G164 to 600 gm/m².
- .7 Isolation Coating
 - .1 Isolate aluminum from the following components, by means of isolation coating:
 - .1 Dissimilar metals except stainless steel, zinc, or white bronze.
 - .2 Concrete, mortar and masonry.
 - .3 Wood.

Part 3 Execution

3.1 EXAMINATION

- .1 Inspect Work and conditions affecting the Work of this Section. Proceed only after deficiencies have been corrected.
- .2 Ensure that flashings built-in or integrated with system to divert moisture to exterior.
- .3 Ensure that all anchor blocks or inserts required to receive system are correctly located and installed.
- .4 Ensure that all anchors and setting or installing components provided by this Section for installation are properly located and installed.

- .5 Ensure that building air and vapour retarding membranes can be sealed to window units to maintain system integrity. Coordinate with materials installation specified in Section 07 21 19 – Foam-In-Place Insulation and Section 07 27 13 – Modified Bituminous Air and Vapour Barrier.

3.2 PREPARATION

- .1 Coordinate dimensions, tolerances, and method of attachment with other work.
- .2 Supply anchorage devices and inserts to the appropriate sections where required for building in or casting-in-place and instruct as to proper location and position. Anchors shall have three-way adjustments.
- .3 Remove dust and other loose material from openings.
- .4 Verify that surfaces are ready to receive work and floor to floor dimensions are as indicated on shop drawings.

3.3 INSTALLATION: CURTAIN WALL

- .1 Install curtain wall systems to AAMA CWM, and manufacturer's written instructions, as required to meet or exceed specified performance criteria.
- .2 Use only concealed fasteners, type 304 stainless steel unless otherwise specified.
- .3 Erect all work plumb and true and in proper alignment and relationship to established lines and grades.
- .4 Devices for anchoring the frame assemblies shall have sufficient adjustment to permit correct and accurate alignment. After alignment, positively secure anchorage devices to prevent movement other than those designed for expansion and contraction. Take into consideration climatic conditions prevailing at time of installation.
- .5 Perform welding and drilling of concrete as required to install fixings. Repair, concrete chipped by drilling or fixing operations.
- .6 Group components with shop applied finishes so that those that relate most closely to one another, with regard to colour and appearance, shall be installed adjacent to each other.
- .7 Coordinate work of this section with, and provide connection for, compartmentalization of air spaces provided under other sections.
- .8 Provide thermal insulation and air/vapour barriers compatible and continuous with adjacent thermal and air/vapour barrier systems.
- .9 Apply continuous butyl sealing tape between sheets at lap and between steel and other materials. Screw sheets to each other and metal framing with type 304 stainless steel sheet metal screws, 150 mm o.c. maximum. Continuously seal perimeter of panels with tape and sealant. Place type 304 stainless steel washers over rubber washers under screw heads and cover with sealant to make fastenings air and vapour tight.
- .10 Seal joints of metal, apertures and protrusions of any kind with specified sealant to produce homogeneous air/vapour barrier seal. Joints shall be air, water and weathertight.

- .11 Apply a continuous bead of sealant to all joints and air/vapour barrier junctions with adjacent construction. Liberally butter screw fastenings with sealant.
- .12 Supply and install flexible, continuous gasket air/vapour barrier seals between work of this section and adjacent construction, and at deflection and expansion connections, where required. Prime substrates, apply gaskets to framing and to concrete and masonry with adhesive and retain with continuous aluminum or stainless steel plates or bars and non-corrosive mechanical fasteners. Ensure a continuous permanent seal at joints.
- .13 Provide air tight seals at penetrations in air/vapour barriers.
- .14 Support adhesive-applied clips in place until adhesive has set.
- .15 Isolate metal air/vapour barriers with thermal breaks and spacers.
- .16 Locate vapour barrier on the warm-in-winter side of the insulation.
- .17 Ensure a uniform, continuous thermal and vapour barrier effect. Where adjacent insulation and vapour barriers are to be provided under other sections, coordinate the work such that thermal and vapour barrier continuity is achieved. Ensure compatibility with adjacent thermal and air/vapour barrier systems. Ensure compatibility between tapes, sealants and air/vapour barriers.
- .18 Cut insulation as required and fit snugly to penetrations, obstructions, openings and corners. Butt insulation boards tightly. Cut out back of board insulation as required to accommodate substrate irregularities and build up over cut out areas on the other side as required to ensure thermal barrier uniformity unless otherwise approved.
- .19 Install insulation to thicknesses shown on the Drawings.
- .20 Press insulation boards firmly to barrier or substrate impaling them on clips without bending clips. Butt insulation boards tightly. Install retainers to clips.
- .21 Fill irregular shaped voids within assemblies with fibrous glass packing insulation to maintain continuity of thermal barrier.
- .22 Protect exterior finished surfaces by installing snap-on caps only when building is closed in, and when the possibility of damage due to construction has been minimized, to the approval of the Consultant.
- .23 Secure snap-on caps with concealed stainless steel fasteners, minimum two per cap.
- .24 Install operable windows and related hardware, at locations indicated and ensure weathertight, rattle-free closure when units are in the closed and locked position. Perform drilling required to install stops and other hardware items fixed to adjacent construction.
- .25 Protect exterior finished surfaces by installing snap-on caps when the possibility of damage due to construction has been minimized.
- .26 Provide structural steel framing and supports required to support work of this Section unless indicated to be supplied under other Sections. Provide structural steel support or reinforcement for anchorage of railings.
- .27 Supply and install galvanized formed steel coping supports.

- .28 Supply and install sheet waterproofing membrane at copings and parapets as indicated. Lap, adhere, and seal joints in membrane in accordance with recommendations of the membrane manufacturer to provide a watertight, continuous membrane.

3.4 INSTALLATION GLAZING: FIELD

- .1 Install windows, vents, doors and skylights to AAMA/WDMA/CSA 101/I.S.2/ and CSA A440.
- .2 Install glass and insulating glass units to GANA Glazing Manual recommendations, minimum, and as required to meet or exceed specified performance criteria.
- .3 Provide triple-glass insulating vision lights and spandrel glass panels, as indicated on the drawings, throughout the curtain wall cladding.
- .4 Fabricate units accurately to size allowing 6 mm clearance between frame and glass edge. Butt joints shall be plumb and square, uniformly spaced. Ensure that glass rebates/glazing surfaces are clean and dry before placing glass and glazing gaskets and in place.
- .5 Apply structural glazing tape to faces of back-up mullions and setting blocks to top of horizontal rails, to evenly distribute weight.
- .6 Clean edges of glass units with recommended cleaner and lift them in place. Press into place to assure good contact between glazing gaskets/structural glazing tape and glass, and secure with temporary pressure plates/clamps. Align glass, as necessary; butt joints to be aligned and plumbed and centred on back-up mullion. Vertical joints shall be aligned top to bottom of curtain wall.
- .7 Run a continuous bead of structural sealant into void space between glass and backup mullion filling same completely. Tool/wipe flush with face of mullion. Install insulated back-pans behind spandrel panels. Fit flanges tight to frames and seal junctions.
- .8 Face seal butt joint behind horizontal pressure plates.
- .9 Remove temporary clamps/plates after silicone has set. Apply pressure plates and caps to horizontals to secure glass.
- .10 Excepting corner joints, open faces of vertical joints shall be covered with a snap-in-place, neoprene face seal gasket, colour matched to glass spandrels. Cut and fit ends tight to glazing caps. Corner joints shall be packed and sealed with structural silicone; tool surface and wipe off excess each side of joint.

3.5 SEALANT

- .1 General:
 - .1 Seal joints between frame assemblies and adjacent construction except where specified to be done under other sections, and within glazed assemblies where required to maintain weather tightness and integrity of air/vapour barrier. Seal junctions in sheet metal air/vapour barriers and between air/vapour barriers and adjacent construction.
- .2 Preparation:
 - .1 Ensure that joint conditions are suitable for the materials to be installed.

- .2 Ensure that surfaces to be sealed are sound, dry, free from dirt, water, frost, loose scale, corrosion, or other contaminants which may adversely affect the performance of the sealant materials. Remove protective oil coatings and other oil or grease films.
 - .3 Perform cleaning to the extent required to achieve acceptable joint surfaces.
 - .4 Protect cleaned and primed surfaces from further contamination by oil, dust, rain, condensation and other materials detrimental to sealant bonding strength. Re-clean and re-prime contaminated surfaces.
 - .5 Install joint filler strips as backup for sealant to provide optimum joint profile, but not less than 6 mm depth of sealant bead. Provide bond breaker tapes where required.
 - .6 Mask areas adjacent to the joints to prevent contamination of adjacent surfaces. Remove masking promptly after the joint has been completed.
 - .7 If recommended by the manufacturer of the sealant materials, prime joints to prevent staining, or to assist the bond.
 - .8 Apply primer with a brush which will permit all joint surfaces to be primed. Perform priming immediately before installation of sealant.
- .3 Installation:
- .1 Obtain approval from the sealant manufacturer for the priming, cleaning and application techniques at commencement of the sealant installation.
 - .2 Before sealant installation is commenced, test the sealant for adhesion to substrates.
 - .3 Install materials in compliance with the recommendations of their manufacturers.
 - .4 Do not exceed shelf life and pot life of materials, nor installation times, as stated by the manufacturer. Ensure sealant manufacturer's on-site quality control procedures are maintained.
 - .5 Be familiar with the work life of the sealant to be used. Do not mix multiple component materials until required for use.
 - .6 Mix sealants thoroughly with a mechanical mixer without mixing air into the materials. Continue mixing until the material is a uniform colour and free from streaks of unmixed material.
 - .7 Before any sealing is commenced, test the materials for indications of staining or poor adhesion.
 - .8 Sealants shall be of gun grade or knife grade consistency to suit the joint condition. Use gun nozzles of the proper sizes to suit the joints and the sealant material.
 - .9 Install sealant with pressure operated guns.
 - .10 Use sufficient pressure to fill all voids and joints full. Sealants shall bond to all sides of joint except where filler or bond breaker material is used. Where filler or bond break material is used, sealant shall bond to both sides of joints and shall not adhere to the filler or bond break material.
 - .11 Ensure that the correct sealant depth is maintained. Superficial painting with a skin bead will not be accepted.

- .12 Sealant installations shall be a full bead free from air pockets and embedded impurities and having smooth surfaces, free from ridges, wrinkles and sags.
- .13 After joints have been completely filled, tool them neatly to a slightly concave surface.
- .14 If joints are masked, remove masking immediately after tooling and before sealants begin to cure.
- .15 Install exposed structural silicone sealants at glazing so that top surfaces of the beads are formed to drain water away from the glass.
- .16 Clean excess sealants from glass and framing surfaces immediately after installation.
- .17 Cover all fasteners penetrating the air/vapour barriers with sealant.
- .18 Immediately clean adjacent surfaces which have been soiled and leave work in a neat, clean condition. Remove excess materials and droppings using recommended cleaners and solvents.

3.6 FIELD QUALITY CONTROL

- .1 Inspection will monitor quality of installation and glazing.
- .2 Test to ASTM E1105, and AAMA 501.
- .3 Evaluate installed system by infrared thermographic scan.
- .4 Manufacturer's Field Services:
 - .1 Curtain wall product manufacturers to provide field surveillance of installation of their Products.
 - .2 Monitor and report installation procedures, unacceptable conditions.

3.7 FIELD TESTING REQUIREMENTS

- .1 Conduct window performance testing on 5% of the installed curtain wall windows (minimum of five windows) by a testing agency designated by the Consultant.
- .2 Provide full wall assembly and seals to window opening in area of all tests (for a minimum distance of 1m beyond rough opening). Plywood may be used as a temporary exterior cladding for the tests, otherwise the specified cladding is to be in place at the time of testing.
- .3 Test one (1) curtain wall module at 10%, 25%, 50%, and 75% of aluminum work installation completion Testing selection shall include:
 - .1 Water Penetration: Field testing to be in accordance with AST E1105, by using AAMA 502-02 Test Method B.
 - .2 Field calibrated nozzle testing done to AAMA 501.2-03 standard. (Minimum 100 linear feet of joints interfacing with curtain wall).
 - .3 Chamber Air/Water penetration testing done to ASTM E783 and E1105 standards, respectively
 - .4 Test levels shall be as noted under performance requirements of Clause 1.5.
 - .5 Assemblies which fail to pass the performance requirements, the costs to repair/replace/adjust the assemblies and the costs for subsequent testing to confirm conformance shall be borne by the subcontractor.

- .6 All modifications required to pass field test shall be performed on all other affected or similar windows.
- .7 Test levels shall be as noted under performance requirements of Clause 1.7.
- .8 In the event that wall assemblies fail to pass the performance requirements initially, the costs to repair/replace/adjust the assemblies and the costs for subsequent testing to confirm conformance shall be borne by the Contractor. Location of air barrier imperfections shall be performed in accordance with ASTM E1186-03.

3.8 ADJUSTING

- .1 Replace defective materials and materials damaged due to faulty installation, careless handling or other causes resulting from work of this section.
- .2 Upon completion of the work and just prior to final review, or at a time as directed, inspect units for damage and correct same immediately.
- .3 Test and adjust hardware and replace or repair faulty items.
- .4 Adjust weather-stripping to leave each opening unit in its most weathertight position.
- .5 Test operable elements and ensure easy and smooth operation.

3.9 CLEANING

- .1 Remove protective material from pre-finished aluminum surfaces, interior and exterior.
- .2 Remove, as work progresses, corrosive and foreign materials that may set or become difficult to remove at time of final cleaning or that may damage members. Inspect minimum monthly to ensure cleanliness.
- .3 Wash exposed surfaces with a pre-approved cleaning solution approved by manufacturers of glass and aluminum. Take care to remove dirt from corners. Wipe surfaces clean.
- .4 Select, apply and maintain cleaning and protective methods to ensure finishes will not become uneven or impaired as a result of unequal exposure to light and weathering conditions.
- .5 Perform final cleaning after completion of entire installation when approved by the Consultant. Remove dirt and stains where such does not respond to the washing or cleaning specified in Section 01 74 11 - Cleaning, refer the condition to the Consultant, with recommendations as to the remedial action required; but do not undertake any cleaning procedure of a more severe nature without the written approval.
- .6 Cleaning shall include the interior/exterior surfaces of materials installed under this section.
- .7 Remove excess sealant by moderate use of mineral spirits or other solvent acceptable to sealant manufacturer.
- .8 Upon completion of the work of this section, remove debris, equipment and excess material resulting from the work of this section from the site.

- .9 Provide the Owner with instructions for proper method and materials to be used in maintenance cleaning of finished surfaces.

3.10 PROTECTION

- .1 Protect finished Work from damage.

END OF SECTION

Part 1 General

1.1 SUMMARY

- .1 Section includes conventionally glazed aluminum windows installed as systems consisting of, but not limited to, the following:
 - .1 Fixed, clear, low emissivity (Low E) sealed glass units.
 - .2 Internal weep drainage and compartmentalization in accordance with established design principles for rain screen and pressure equalization in curtain wall systems.
- .2 Drawings contain details that suggest directions for solving some of the major design requirements; these details can be developed further by the Contractor provided that the final installation adheres to aesthetic criteria established by the drawings and specified dimensions with all elements in planes as drawn, maintaining their relationships with all other building elements.
- .3 Related Requirements:
 - .1 Section 06 10 00 – Rough Carpentry
 - .2 Section 07 27 13 – Modified Bituminous Air and Vapour Barrier
 - .3 Section 07 27 19 – Sheet Membrane Air and Vapour Barriers
 - .4 Section 07 62 00 – Sheet Metal Flashing and Trim
 - .5 Section 07 92 00 – Sealants
 - .6 Section 08 44 13 – Glazed Aluminum Curtain Walls
 - .7 Section 08 80 50 – Glazing
 - .8 Section 09 21 16 – Gypsum Board Assemblies

1.3 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Submit product data in accordance with Section 01 33 00 – Submittal Procedures:
 - .1 Submit manufacturer's printed product literature, specifications and datasheet.
 - .2 Submit WHMIS SDS - Safety Data Sheets acceptable to Labour Canada, and Health and Welfare Canada. Indicate VOC's for sealant materials.
- .2 Submit copies of test reports to establish that the products assembled by this manufacturer comply with the specified Performance Class, Performance Grade,

Water Test Pressure, and Air Infiltration/Exfiltration Level as tested to NAFS-11 and the Canadian Supplement. Submit complete test reports showing all component drawings.

- .3 Submit shop drawings in accordance with Section 01 33 00 – Submittal Procedures:
 - .1 Submit shop drawings signed and sealed by the Manufacturer's Engineer clearly indicating:
 - .1 Components, materials, finishes, and locations of anchorage.
 - .2 Section details showing all window perimeter conditions.
 - .3 Mullion details and frame corner connections.
 - .4 Sill flashing terminations, in isometric view, including coordination with wall cladding materials.
 - .5 Frame anchorage details.
 - .6 Details showing sealing techniques within and around perimeter of framing and operable sash.
 - .7 Connection to building sheet membrane air and vapour retarder.
 - .8 Required sizes and tolerance of openings.
- .4 Submit samples in accordance with Section 01 33 00 – Submittal Procedures:
 - .1 Submit one representative model of each type window.
 - .2 Include frame, sash, sill, glazing and weatherproofing method, insect screens, surface finish and hardware. Show location of manufacturer's nameplates.
 - .3 Include 150 mm long samples of head, jamb, sill to indicate profile.
- .5 Provide Tests in Accordance with Section 01 45 00 – Quality Control:
 - .1 Static Pressure Air Exfiltration Smoke Test, provide one test.
 - .2 Static Pressure Water Infiltration: ASTM E331 Standard Test Method for Water Penetration by Uniform Static Air Pressure Difference. A minimum 15 minute wait period shall be included after this and each subsequent water penetration test.
 - .3 Dynamic Pressure Water Infiltration: AAMA 501.1 Standard Test Method for Exterior for Water Penetration using Dynamic Pressure. Include two setups.
 - .4 Test and Evaluation Reports:
 - .1 Submit test reports from approved independent testing laboratories, certifying compliance with specifications.
 - .2 All test reports that reference the NAFS must include, on the first page, a summary of the results including, at minimum:
 - .1 The product manufacturer.
 - .2 The type of product.
 - .3 The model number/series number.
 - .4 The primary product designation.
 - .5 The secondary product designation.
 - .1 Positive design pressure.

- .2 Negative design pressure.
 - .3 Water penetration resistance test pressure.
 - .4 Canadian air infiltration and exfiltration levels.
 - .6 The test completion date.
 - .3 The report will also contain the following information:
 - .1 Test dates.
 - .2 Report preparation dates.
 - .3 Test information retention period.
 - .4 Location of testing facilities.
 - .5 Full description of test samples, including:
 - .1 Anodized finish, weathering characteristics.
 - .2 Condensation resistance.
 - .3 Forced entry resistance.
 - .4 Mullion deflection - combination and composite windows.
 - .6 Complete description of amendments, as applicable.
 - .7 Conclusion.
 - .8 Drawings signed by the testing laboratory, if provided.
- .6 LEED Submittals: provide LEED submittals in accordance with Section 01 61 01 – LEED Product Requirements.

1.4 CLOSEOUT SUBMITTALS

- .1 Provide operation and maintenance data for windows for incorporation into manual specified in Section 01 78 00 - Closeout Submittals.

1.5 QUALITY ASSURANCE

- .1 Window fabricator shall have a minimum of five years successful experience in the fabrication and erection of metal windows of similar sizes, shapes and finishes to the units required for this project and shall have ample facilities to produce, furnish and supply the units as required for installation without delay to the Work.
- .2 Retain a professional engineer registered in the Province of the Work experienced in structural design in glass and aluminum window units, connections to door units and connections to building, to ensure the adequacy of the structural aspects of the design, manufacture, and installation of complete assembly. This Engineer is called the "Manufacturer's Engineer" elsewhere in this Section.
- .3 Only fabricators approved by Manufacturer shall fabricate and install products of this Section.

1.6 DELIVERY, STORAGE, AND HANDLING

- .1 Deliver, handle and store units in accordance with manufacturer's directions.
- .2 Store units at site on raised wood pallets protected from the elements and corrosive materials. Do not remove from crates or other protective covering until ready for installation.

- .3 Store all glass units vertically on end with solid bearing full thickness of insulating units.
- .4 Store pre-fabricated frame assemblies blocked off the ground to prevent warping, twisting, undo strain on assembly or physical abuse and damage.
- .5 Packaging Waste Management
 - .1 Separate and recycle waste materials in accordance with Section 01 74 19 – Construction Waste Management.

1.7 SITE CONDITIONS

- .1 Protect aluminum finishes and glazing during erection against disfiguration, contamination or damage by abuse of harmful materials. Install protective cover where exposure to damage is critical.
- .2 After glass is installed, mark each light with large cross or other symbol to make glass obvious and noticeable to other trades. Use substance which will not stain, mark or "Shadow" glass either by itself or by reaction with sunlight, moisture or the environment. Do not use masking tape.
- .3 Co-ordinate installation of windows with Work specified in other Sections to ensure proper placement and installation of vapour barrier, insulation and flashing in order that air/vapour/thermal barrier of building is intact and moisture will be diverted to the exterior.

1.8 WARRANTY

- .1 Provide manufacturer's written guarantee, signed and issued in the name of Owner, to replace the following items for defective material and workmanship for the time stated from date of Substantial Performance:
 - .1 Framing, panels and glazing: failure of performance requirements specified in Contract Documents; ten years.
 - .2 Sealed glass units: misting, dusting and seal failure; ten years.
 - .3 Sealants, caulking: failure to maintain seal; two years.
 - .4 Aluminum brake shapes: oil-canning and delaminations; two years.
- .2 Anodized Aluminum: Provide 2 year for Class II finishes and 5 years for Class 1 Finishes that metal will not change colour more than 5 DEcmc per AAMA 611 and finished metal will not crack, blister, check, or peel.
- .3 Provide Warranty for aluminum windows to include in maintenance manuals as specified in Section 01 78 00 – Closeout Submittals.

Part 2 Products

2.1 WINDOW TYPE AND CLASSIFICATION

- .1 Types:
 - .1 Fixed: with removable triple glazing insulating glass.
 - .1 Basis-of-Design Materials:
 - .1 AWS 90 SI+ optimized (PHI cool-temperate certified), Schüco.

- .2 Acceptable Manufacturer:
 - .1 Aluprof
- .2 Tilt and turn: with removable triple glazing insulated glass.
 - .1 Basis-of-Design Materials:
 - .1 AWS 90 SI+ optimized (PHI cool-temperate certified), Schüco.
 - .2 Acceptable Manufacturer:
 - .1 Aluprof
 - .3 Screens: on windows as indicated.
- .2 Classification rating: to AAMA/WDMA/CSA 101/I.S. 2/A440-11 (NAFS-11) AND CSA A440S1-19 CANADIAN SUPPLEMENT TO NAFS-11.
 - .1 Performance Class: AW.
 - .2 Performance Grade: PG60.
 - .3 Air Leakage: Fixed and A3.
 - .4 Water Penetration Test Pressure: minimum 580 Pa.
 - .5 Design Pressure: 2880 Pa.
 - .6 Forced Entry: F2.
 - .7 Insect Screens: S2.

2.2 PERFORMANCE/DESIGN CRITERIA

- .1 Performance Requirements: Provide assemblies able to withstand positive and negative pressures normal to the plane of window in accordance with Building Code climatic requirements based on one in 30 year criteria in accordance with CSA A440.
- .2 Provide aluminum framed window systems, including anchorage, capable of withstanding, without failure, the effects of the following:
 - .1 Thermal movements.
 - .2 Movements of supporting structure including, but not limited to, deflection from uniformly distributed and concentrated live loads.
 - .3 Dimensional tolerances of building frame and other adjacent construction.
- .3 Provide drainage from all spaces around insulating glass units, including each horizontal space created by setting blocks.
- .4 Provide baffles or other protection at drainage openings to prevent direct entrance of wind-driven rain.

2.3 MATERIALS

- .1 Aluminum: Aluminum Association (AA) alloy 6063-T5 or 6063-T6 for aluminum extrusions and AA 1100, anodizing quality, for aluminum sheet, minimum 3 mm thickness.
- .2 Fasteners: To ASTM A480/A480M, stainless steel, type 304 selected to prevent galvanic action with the components fastened, of suitable size to sustain imposed loads.

- .3 Gaskets: silicone with dimensional tolerances and durometer hardness and of suitable size and shape to meet the requirements of the specifications and their specific application.
- .4 Supporting angles, plates, bars, rods, and other steel accessories: Mild steel CSA G40.20/G40.21, shop painted with zinc chromate primer, thickness as required to sustain imposed loads and in no case less than 5 mm thick.
- .5 Sealant: Including primer, joint filler, as specified in Section 07 92 00 - Sealants.
- .6 Isolation coating: alkali resistant bituminous paint.
- .7 Thermal separator: Polyvinylchloride, 50 Shore A durometer hardness +5.
- .8 Glazing Tape: Refer to Section 08 80 50 - Glazing.
- .9 Metal air seal/vapour barrier (by window supplier) to be bonded to window frame and extend behind mounting frame. Seal all corners to maintain air seal vapour retarder. Install flexible flashing with continuous metal retaining strip to lap to interior wall assembly.
- .10 Exterior Aluminum Frame: Thermally broken frame to profiles indicated and as required to fulfill performance requirements, nominal thickness 3 mm, suitable alloy and proper temper for extruding and adequate structural characteristics; and suitable for finishing as specified, and as follows:
 - .1 Glazing Throat: to suit thickness of sealed glass unit.
 - .2 Back Frame Profile: 50 mm x depth as indicated on Drawings.
 - .3 Cover: Nominal 50 mm x depth as indicated on Drawings.
 - .4 Basis-of-Design Materials:
 - .1 AWS 90 SI, Schüco.

2.4 GLAZING AND ACCESSORIES

- .1 Triple Pane Insulating Glass Units: as specified in Section 08 80 50 – Glazing.
- .2 Clean sealing surfaces at perimeter of glass and sealing surfaces of rabbets and stop beads before applying splines or gaskets. Use solvents and cleaning agents recommended by manufacturer of sealing materials.
- .3 Install glazing gaskets uniformly with accurately formed corners and bevels. Ensure that proper contact is made with glass and rabbet interfaces.
- .4 Support lites of glass thermal units on leveled setting blocks, 4 or 6 mm minimum, spaced as recommended by glass manufacturer. Provide at least one setting block at quarter points from each corner. For casement windows, locate setting blocks closer to corners as recommended by manufacturer.
- .5 Centre glass thermal units in glazing rabbet to maintain 6 mm minimum clearance between edges of glazing and plastic framing at sill or 4 mm minimum clearance between edges of glazing and plastic framing at sill if glazing bite incorporates a drainage channel with a depth of 3 mm minimum.
- .6 Size glass thermal units to ensure exposed face of spacer is in line with glazing stops.
- .7 Use spacers and shims in accordance with glass manufacturer's recommendations.

2.5 FABRICATION

- .1 Fabricate in accordance with CSA A440 supplemented as follows:
- .2 Fabricate units square and true with maximum tolerance of plus or minus 1.5 mm for units with a diagonal measurement of 1800 mm or less and plus or minus 3 mm for units with a diagonal measurement over 1800 mm.
- .3 Face dimensions detailed are maximum permissible sizes.
- .4 Brace frames to maintain squareness and rigidity during shipment and installation.
- .5 Finish steel clips and reinforcement with 380 g/m² zinc coating to CSA G164.

2.6 ALUMINUM FINISHES

- .1 Finish exposed surfaces of aluminum components in accordance with Aluminum Association Designation System for Aluminum Finishes.
 - .1 Coloured Anodized Finish: Exposed aluminum surfaces shall be Aluminum Association (AA) Architectural Class I, AA-M12C22A44, colour to match anthracite grey as indicated on Drawings.
 - .2 Unexposed aluminum: Mill finish.
- .2 Isolation Coating
 - .1 Isolate aluminum from the following components, by means of isolation coating:
 - .1 Dissimilar metals except stainless steel, zinc, or white bronze.
 - .2 Concrete, mortar and masonry.
 - .3 Wood.

2.7 HARDWARE

- .1 Hardware: Manufacturer's standard sash locks and aluminum handles to provide security and permit easy operation of units.
- .2 Locks: provide operating sash with spring loading locking device, to provide automatic locking in closed position.
- .3 Provide special keyed opening device for windows normally locked.
- .4 Weatherstripping at Operable Sash: neoprene, thermoplastic rubber or EPDM, flexible at minimum design temperature, and as follows:
 - .1 Profiled to mechanically key into window frame and operable sash.
 - .2 Removable without special tools and without dismantling of sash or frame.
 - .3 Designed to maintain pressure contact against sash through design temperature range.
- .5 Where windows latching devices are located in excess of 1900 mm above floor level:
 - .1 Equip tilt and turn units with roto operators with locking handle.
- .6 Force to operate locking devices shall not exceed 20 N.

2.8 AIR BARRIER AND VAPOUR RETARDER

- .1 Equip window frames with site installed air barrier and vapour retarder material for sealing to building air barrier and vapour retarder as indicated in Section 07 27 13 – Modified Bituminous Air and Vapour Barrier.

Part 3 Execution

3.1 EXAMINATION

- .1 Inspect Work and conditions affecting the Work of this Section. Proceed only after deficiencies have been corrected.
- .2 Ensure that flashings are built-in or integrated with system to divert moisture to exterior.
- .3 Ensure that all anchor blocks or inserts required to receive system are correctly located and installed.
- .4 Ensure that all anchors and setting or installing components provided by this Section for installation are properly located and installed.
- .5 Ensure that building air and vapour retarding membranes can be sealed to window units to maintain system integrity. Coordinate with materials installation specified in Section 07 21 19 – Foam-In-Place Insulation and Section 07 27 19 – Sheet Membrane Air and Vapour Barrier.

3.2 PREPARATION

- .1 Obtain all dimensions from the job site.
- .2 Provide data, dimensions and components, anchors and assemblies to be installed in proper time for installation.

3.3 INSTALLATION

- .1 Erect Work in strict accordance with manufacturer's written instructions.
- .2 Conceal all anchors and fitments. Exposed heads of fasteners not permitted. All joints in exposed work to be flush hairline butt joints.
- .3 Use anchors that will permit sufficient adjustment for accurate alignment. Make allowance for deflection of building structure.
- .4 Build in and provide any supplementary reinforcing and bracing required by assembly loads and deflections.
- .5 Secure Work adequately to structure in a manner not restricting thermal and wind movement.
- .6 Correctly locate and install flashings, deflectors and weep holes to ensure proper drainage of moisture to exterior.
- .7 Maintain alignment with adjacent Work.
- .8 Isolate aluminum surfaces from adjacent dissimilar materials and metals with coatings of bituminous paint.

- .9 Fill shim spaces at perimeter of assembly to maintain continuity of thermal barrier with foam-in-place insulation and seal with materials specified in Section 07 92 00 – Sealants.

3.4 GLAZING INSTALLATION

- .1 Ensure all stops, gaskets, splines, seals etc., are aligned and ready to receive glazing and insulated panels as specified herein.
- .2 Install glazing to approved details and instruction, using material specified in accordance with manufacturer's instructions.
- .3 Glazing stops shall be of a continuous length from corner to corner, and be fitted at corners.
- .4 All preformed tapes or gaskets shall be of a continuous length corner to corner and shall be cut over length to prevent stretching. Joints, splices and corners shall be mitred and sealed.
- .5 Clean all contact surfaces of glazing with solvent and wipe dry. Ensure all glazing channels are clean, true to line, and free of dirt or debris and that weep and drainage vents are open.
- .6 Rest glazing on setting blocks at 1/4 points.
- .7 Install shims at sides to align glass units.
- .8 Apply a full heel bead of non-drying non-skinning sealant to the interior perimeter of each glass unit to provide positive air/vapour seal to warm light of glass.

3.5 SEALANTS

- .1 Caulk and seal full perimeter of windows to building air/vapour retarder to provide and maintain the designed air/vapour/thermal barrier integrity and weather tightness.
- .2 Install sealants and back-up materials in strict accordance with manufacturer's written instruction.

3.6 TESTING

- .1 Test one (1) punched window at 10%, 25%, 50%, and 75% of aluminum work installation completion.
- .2 Field calibrated nozzle testing to AAMA 501.2-03 standard. (Minimum 50 linear feet of joints interfacing with punched window).
- .3 Chamber Air/Water penetration testing to ASTM E783 and E1105 standards, respectively.

3.7 CLEANING

- .1 Remove surplus materials, rubbish, tools, and equipment barriers upon completion of installation.

- .2 Remove all protective surface covering film and wrappings at completion of Work. Clean glass, panels and frames using mild soap or other cleaning agent approved by manufacturer.
- .3 Remove excess glazing or joint sealing materials from exposed surfaces. Clean and polish glass.

END OF SECTION

Part 1 General

1.1 SUMMARY

- .1 Section Includes:
 - .1 Door Hardware
 - .2 Fastenings.
- .2 Related Requirements:
 - .1 Section 08 11 13 – Steel Doors and Frames.
 - .2 Section 08 11 16 – Aluminum Doors and Frames
 - .3 Division 26: Electrical wiring for magnetic strikes, electric releases and electric locks.

1.2 REFERENCES

- .1 Reference Standards:

1.3 ADMINISTRATIVE REQUIREMENTS

- .1 Pre-Installation Meetings: convene pre-installation meeting in accordance with Section 01 31 19 – Project Meetings to:
 - .1 Verify project requirements.
 - .2 Review installation and substrate conditions.
 - .3 Co-ordination with other building subtrades.
 - .4 Review manufacturer's warranty requirements.

1.4 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Submit product data in accordance with Section 01 33 00 – Submittal Procedures:
 - .1 Submit manufacturer's printed product literature, specifications and data sheets.
- .2 Submit samples in accordance with Section 01 33 00 – Submittal Procedures:
 - .1 Identify each sample by label indicating applicable specification paragraph number, brand name and number, finish and hardware package number.
 - .2 After approval samples will be returned for incorporation in the Work.
- .3 Hardware List:
 - .1 Submit contract hardware list in accordance with Door Hardware Schedule.
 - .2 Indicate specified hardware, including make, model, material, function, size, finish and other pertinent information.
 - .3 Coordinate Division 28 Security Contractor, Division 26 Electrical Contractor and Division 8 Door and Hardware Contractors to jointly prepare, submit, and obtain certified approval from the Consultant shop drawings for work related to door access control systems prior to undertaking the on-site work. The joint submission will clarify and assign responsibility between these Divisions for labour and materials associated with the supply and installation of electronic and physical components for doors and access control. An individual drawing shall be submitted in Cadd format for each door within the project scope depicting both public and secure side of door and arrangement of access control and security components, conduit, and cabling.
- .4 Keying Schedule:
 - .1 Submit keying schedule prepared by or under the supervision of qualified Architectural Hardware Consultant (AHC), detailing Owner's final keying instructions for locks, including schematic keying diagram and index each key set to unique door designations.

- .5 Manufacturer's Instructions:
 - .1 Submit manufacturer's installation instructions.
- .6 LEED Submittals: provide LEED submittals in accordance with Section 01 61 01 – LEED Product Requirements.

1.5 CLOSEOUT SUBMITTALS

- .1 Provide operation and maintenance data for door closers, locksets, door holders electrified hardware and fire exit hardware for incorporation into manual specified in Section 01 78 00 - Closeout Submittals.

1.6 MAINTENANCE MATERIAL SUBMITTALS

- .1 Extra Materials:
 - .1 Provide maintenance materials in accordance with Section 01 78 00 - Closeout Submittals.
 - .2 Supply two sets of wrenches for door closers, locksets, and fire exit hardware.

1.7 QUALITY ASSURANCE

- .1 Regulatory Requirements:
 - .1 Hardware for doors in fire separations and exit doors certified by a Canadian Certification Organization accredited by Standards Council of Canada.
- .2 Certificates: product certificates signed by manufacturer certifying materials comply with specified performance characteristics and criteria and physical requirements.
- .3 Test Reports: certified test reports showing compliance with specified performance characteristics and physical properties.

1.8 DELIVERY, STORAGE, AND HANDLING

- .1 Packing, Shipping, Handling and Unloading:
 - .1 Deliver, store, handle and protect materials in accordance with Section 01 61 00 - Common Product Requirements.
 - .2 Package each item of hardware including fastenings, separately or in like groups of hardware, label each package as to item definition and location.
- .2 Storage and Protection:
 - .1 Store finishing hardware in locked, clean and dry area.
- .3 Packaging Waste Management
 - .1 Separate and recycle waste materials in accordance with Section 01 74 19 – Construction Waste Management.

1.9 WARRANTY

- .1 Provide written warranty, executed by manufacturer agreeing to repair or replace components of door hardware that fail in materials or workmanship within specified warranty period.

- .2 Failures include, but are not limited to, the following:
 - .1 Structural failures including excessive deflection, cracking, or breakage.
 - .2 Faulty operation of operators and door hardware.
 - .3 Deterioration of metals, metal finishes, and other materials beyond normal weathering.
- .3 Warranty Period: From date of Substantial Performance, and as follows:

Hardware Type	Warranty Term
Locks, latches and cylinders	Two years
Closers	25 years
Hinges	One year
Panics	Three years
Miscellaneous	One year
Electrical Hardware:	Five years

Part 2 Products

2.1 HARDWARE -GENERAL

- .1 Use one manufacturer's products only for similar items.

2.2 DOOR HARDWARE

- .1 Door Hardware as per attached schedule.

2.3 AUTOMATIC SWING DOOR OPERATORS

- .1 Coordinate the work of all trades, including glass and glazing, masonry, and electrical requirements covered in manufacturer's details and appropriate sections of the specifications.
- .2 The electrical contractor shall provide 117 volt, 60 cycle, single phase 15 ampere service for one-two operators, 30 ampere service for three-four operators, and as follows:
 - .1 Coordinate with electrical contractor for provision of service to each operator from junction box for multiple operators.
 - .2 Coordinate with electrical contractor shall provide electrical conduit and wiring from specified controls to operators as outlined on manufacturer's drawings.
- .3 Finish hardware supplier shall provide and install surface mounted electro-mechanical swing door operator, consisting of electro-mechanical swinging door operator and electronic control, aluminum header, connecting hardware, and power on/off switch and actuator switches.
- .4 Automatic entrance equipment: comply with BHMA A156.10 or A156.19.
- .5 Aluminium header extrusions: minimum nominal 4 mm wall thickness with finish anodized AA-M12-C22-A31 clear.
- .6 Equipment must operate between -35°C and +55°C in all climate conditions.

- .7 Operator: Electro-mechanical system installed in a header to resist dust, dirt and corrosion; entire operator shall be removable from the header as a unit.
- .8 Bearings: Fully lubricated and sealed to minimize wear and friction.
- .9 Operator shall open the door with a 1/8 HP motor through reduction gears, door arm, and linkage assembly, and as follows:
- .10 Low energy operator:
 - .1 Door opening time: not less than four seconds.
 - .2 Door closing time: not less than four and a half seconds.
- .11 The drive train shall have a positive, constant engagement. The operator shall stop the door in the open position by electrically reducing the motor voltage and stalling against a 90° stop.
- .12 Close the door by spring energy; controlled by employing the motor as a dynamic brake.
- .13 Pre-load closing spring for positive closing action at a low material stress level for long spring life.
- .14 The operator shall function as a manual door closer in the direction of swing with or without electrical power.
- .15 The door forces and speeds generated during power opening, and manual opening in both directions of swing, and spring closing in both directions of swing shall conform to the requirements of BHMA A156.10 or A156.19.
- .16 Verify that no defects or errors are present in completed phases of the work that would result in poor application or installation, or cause latent defects of the automatic door equipment.
- .17 Installation and warranty adjustments shall be performed by authorized distributors factory trained technician.

2.4 FASTENINGS

- .1 Use only fasteners provided by manufacturer. Failure to comply may void warranties and applicable licensed labels.
- .2 Supply screws, bolts, expansion shields and other fastening devices required for satisfactory installation and operation of hardware.
- .3 Exposed fastening devices to match finish of hardware.
- .4 Where pull is scheduled on one side of door and push plate on other side, supply fastening devices, and install so pull can be secured through door from reverse side. Install push plate to cover fasteners.
- .5 Use fasteners compatible with material through which they pass.

2.5 KEYING

- .1 Doors, padlocks and cabinet locks to be keyed as directed. Prepare detailed keying schedule in conjunction with Consultant.
- .2 Provide keys in duplicate for every lock in this Contract.
- .3 Stamp keying code numbers on keys and cylinders.

- .4 Provide construction keying.

Part 3 Execution

3.1 INSTALLATION GENERAL

- .1 Compliance: comply with manufacturer's written data, including product technical bulletins, product catalogue installation instructions, product carton installation instructions, and data sheets.
- .2 Furnish metal door and frame manufacturers with complete instructions and templates for preparation of their work to receive hardware.
- .3 Furnish manufacturers' instructions for proper installation of each hardware component.

3.2 HARDWARE

- .1 Install hardware to standard hardware location dimensions in accordance with Canadian Metric Conversion Guide for Steel Doors and Frames (Modular Construction) prepared by Canadian Steel Door and Frame Manufacturers' Association.
- .2 Where door stop contacts door pulls, mount stop to strike bottom of pull.
- .3 Install key control cabinet.
- .4 Use only manufacturer's supplied fasteners. Failure to comply may void manufacturer's warranties and applicable licensed labels. Use of quick type fasteners, unless specifically supplied by manufacturer, is unacceptable.
- .5 Mounting Heights: Mount door hardware units at heights indicated in following applicable publications, unless specifically indicated or required to comply with governing regulations:
 - .1 Standard Steel Doors and Frames: DHI TDH-009 Recommended Locations for Architectural Hardware for Standard Steel Frame.
 - .2 Wood Doors: DHI WDHS.3, Recommended Locations for Architectural Hardware for Wood Flush Doors.
 - .3 Where indicated to comply with accessibility requirements, comply with ICC A117.1 Accessible and Usable Buildings and Facilities.
 - .4 Provide blocking in drywall partitions where wall stops or other wall mounted hardware is located.
- .6 Remove construction cores when directed by Owner, install permanent cores and check operation of locks.

3.3 INSTALLATION: AUTOMATIC SWING DOOR OPERATOR

- .1 Install components as indicated on drawings and as scheduled to manufacturer's recommendations.
- .2 Install door holders to limit doors to opening swing specified.
- .3 Install operators on interior side of exterior entrances.
- .4 Install rubber dampening devices to sound isolate operators from door frames.

- .5 Isolate aluminum surfaces from contact with cementitious materials, using thick coating of bituminous paint. Let paint dry before installation of aluminum component.
- .6 Conceal wiring between activating devices, electric locking system, and operators.
- .7 Coordinate and confirm mechanical systems are balanced to ensure proper closing of doors.

3.4 ADJUSTING

- .1 Adjust door hardware, operators, closures and controls for optimum, smooth operating condition, safety and for weather tight closure.
- .2 Lubricate hardware, operating equipment and other moving parts.
- .3 Adjust door hardware to provide tight fit at contact points with frames.

3.5 CLEANING

- .1 Perform cleaning after installation to remove construction and accumulated environmental dirt.
- .2 Clean hardware with damp rag and approved non-abrasive cleaner, and polish hardware in accordance with manufacture's instructions.
- .3 Remove protective material from hardware items where present.
- .4 Upon completion of installation, remove surplus materials, rubbish, tools and equipment barriers.

3.6 CLOSEOUT ACTIVITIES

- .1 Demonstration:
 - .1 Keying System Setup and Cabinet:
 - .2 Set up key control system with file key tags, duplicate key tags, numerical index, alphabetical index and key change index, label shields, control book and key receipt cards.
 - .3 Place file keys and duplicate keys in key cabinet on their respective hooks.
 - .4 Lock key cabinet and turn over key to Owner.
- .2 Maintenance Staff Briefing:
 - .1 Brief maintenance staff regarding:
 - .1 Proper care, cleaning, and general maintenance of projects complete hardware.
 - .2 Description, use, handling, and storage of keys.
 - .3 Use, application and storage of wrenches for door closers, locksets, and fire exit hardware.
- .3 Demonstrate operation, operating components, adjustment features, and lubrication requirements.

3.7 SCHEDULE

- .1 As per attached Door Hardware Schedule.

Door Handing's

Abbreviations

RH = Right Hand	RHA = Right Hand Active	SS = Single Slider
LH = Left Hand	LHA = Left Hand Active	BP = Bi-Parting Slider
RHR = Right Hand Reverse	RHA/LHA = Right & Left Hands Active	BF = Bi-Folding Slider
LHR = Left Hand Reverse	RHRA/LHRA = Right & Left Hand Reverse Active	TS = Telescopic Slider
RHRA = Right Hand Reverse Active	DA = Double Acting	PKT = Pocket Slider
LHRA = Left Hand Reverse Active	DE = Double Egress	

NOTE: The handing of a swing door is determined by placing yourself on the secured or keyed side of the door.

Products & Alternatives

NOTE: Only those products / brands listed here are acceptable and should be used to form a bid price. No unsolicited products will be considered. If acceptable alternates are listed here those too can be used to form a bid price provided, they are exactly the same as the specified item. If using an alternate product to form a price it is the bidder's responsibility to ensure that product is identical in every way to the specified item. If no alternates are listed, no alternate products are acceptable.

Product Type	Product#	Manufacturer	Alternate Manufacturer 1	Alternate Manufacturer 2
Butt Hinge	TA386 / TA786	McKinney		
Cont. Hinge	661HD	Best		
Exit Device	PE8000 series	Sargent		
Lockset	8200 series	Sargent		
Electric Strike	1500C / 9600	HES		
Coordinator	F7600	Standard Metal		
Power Transfer	CEPT	Securitron		
Flush Bolt	F65UL	Standard Metal		
Dust Proof Strike	F68	Standard Metal		
Overhead Stop	690 series	Sargent		
Door Closer	351 series	Sargent		
Latch Guard	150	HES		
Push / Pull Set	2012-2 x K11A-5	Standard Metal		
Auto Door Operator	ED100	Dormakaba		
Touchless Actuator	CM-325	Camden		
Touchless Restroom Control Kit	CX-WC16	Camden		
Emergency Call System	CX-WEC10K2	Camden		
Relay	CX-33	Camden		
Kick Plate	K10A	Standard Metal		
Threshold	CT-74	KN Crowder		
Weatherstrip	W-23	KN Crowder		
Door Sweep	W24-S	KN Crowder		
Smoke / Sound Seal	W-66	KN Crowder		

Symbols

- Door has a fire rating and all associated hardware must have a fire label to suit. Must comply with local requirements.

- Door is automatic and is equipped with an auto operator. Door must meet local barrier free codes

- Door has an electrical requirement and requires power to be brought to the appropriate location above the door or to the latch, for either security or barrier free applications. Refer to security & electrical drawings for further information.

- Door requires security card access. Refer to security / electrical drawings for further information.

Abbreviations

Door:

HMD = Hollow Metal Door
IHMD = Insulated Hollow Metal Door
ALD = Aluminum Door
SSD = Stainless Steel Door
ISSD = Insulated Stainless Steel Frame
STL = Steel Door
IC-ALD = Insulated Clad Aluminum Door
SCWD = Solid Core Wood Door
HCWD = Hollow Core Wood Door
FGD = Frameless Glass Door
FRP = Fiberglass Reinforced Plastic Door
OHD = Overhead Door

Frame:

HMF = Hollow Metal Frame
ALF = Aluminum Frame
Cased Open HMF = Cased Open Hollow Metal Frame
SSF = Stainless Steel Frame
STL = Steel Frame
WDF = Wood Frame
Cased Open WDF = Cased Open Wood Frame
Cased Open Drywall = Cased Open Drywall

Fire Ratings:

0 HR – Zero Hour Fire Rating / Smoke Barrier
20 MIN – 20 Minute Fire Rating
¾ HR – 45 Minute Fire rating
1 ½ HR – 90 Minute Fire Rating
2 HR – 120 Minute Fire Rating
3 HR – 180 Minute Fire Rating

---	--------------------------	-----------------------------------	----------------------------	--	--	--------------------------

Notes:

- 120VAC is required at the head of the door for all barrier free door operators, 15A dedicated circuit. Wall/Frame must be reinforced for automatic operator mounting, all conduit and back boxes with pull cords are to be provided by the electrical contractor.
- Electrician to confirm wire locations with auto door operator supplier prior to pulling wires.

Method of Operation:

Ingress: Push door for manual entry. Alternatively, the actuator can engage the auto door operator. Once inside the washroom, the 'wave to lock' actuator locks the outside actuator and engages the electric strike. The outside actuator changes colour to indicate the washroom is in use. In the event of an emergency, push the emergency button and audible / visual signals will activate and the door will unlock for access.

Egress: Rotate lever for manual egress, alternatively the actuator can engage the auto door operator.

-----End of Heading-----

End of Door Hardware Schedule

Part 1 General

1.1 SUMMARY

- .1 Section Includes:
 - .1 Tempered safety glass.
 - .2 Laminated safety glass.
 - .3 Spandrel glass.
 - .4 Fire rated glass.
 - .5 Low emissivity (low e) glass.
 - .6 Sealed insulating glass.
 - .7 Accessories.: Sealant, setting blocks, spacer shims, Glazing tape, glazing compound for fire rated glazing materials, glazing splines, glazing clips, Screws, bolts, fasteners, Lock-strip gaskets and accessories:
- .2 Related Requirements:
 - .1 Section 07 92 00 – Sealants
 - .2 Section 08 11 13 – Steel Doors and Frames
 - .3 Section 08 11 16 – Aluminum Doors and Frames
 - .4 Section 08 44 13 – Glazed Aluminum Curtain Walls
 - .5 Section 08 50 13 – Aluminum Windows
 - .6 Section 08 87 53 – Glazing Film

1.2 REFERENCES

- .1 Reference Standards:

 - .2 NFPA (Fire) 252, Fire Tests of Door Assemblies, 2022 Edition.
 - .3 NFPA (Fire) 257, Fire Test for Window and Glass Block Assemblies, 2022 Edition.
- .10 Underwriters Laboratories ECOLOGO Certification Program (UL):
 - .1 UL 2761, Sealants and Caulking Compounds (formerly CCD-045) 2011.

1.3 ADMINISTRATIVE REQUIREMENTS

- .1 Convene pre-installation meetings: one week prior to beginning work of this Section.
 - .1 Verify project requirements.
 - .2 Review installation conditions.
 - .3 Co-ordinate with other building subtrades.
 - .4 Review manufacturer's instructions and warranty requirements.

1.4 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Submit product data in accordance with Section 01 33 00 – Submittal Procedures.
 - .1 Submit manufacturer's printed product literature, specifications and data sheet.

- .2 Submit product data that provides performance data of IGU assemblies, including CoG U-value, SHGC, STC etc.
- .3 Submit electronic copy of WHMIS SDS - Safety Data Sheets. Indicate VOC's:
 - .1 For glazing sealant materials during application and curing.
- .2 Submit shop drawings in accordance with Section 01 33 00 – Submittal Procedures.
 - .1 Delegated Design: Submit shop drawings, signed and sealed by the delegated design engineer, detailing fabrication and assembly of glazed aluminum curtain wall systems clearly indicating all construction details including; but not limited to, the following:
 - .1 Fully dimensioned layouts for positioning of secondary support members and anchorage of tie-back devices to structures;
 - .2 Large scale details of members and materials, of brackets and anchorage devices and of connection and jointing details;
 - .3 Include thermal values and weathertightness rating data.
 - .4 Fully dimensioned layouts for positioning of brackets and anchorage devices to structures;
 - .5 Dimensions, gauges, thicknesses;
 - .6 Type, size and spacing of fastening devices;
 - .7 Glazing details;
 - .8 Air/vapour barrier details, acoustic control details, aluminum alloy and temper designations, metal finishing specifications and other pertinent data and information;
 - .9 Internal drainage;
 - .10 Show details of perimeter and interface connecting work of this section with work of adjacent sections.
- .3 Submit samples in accordance with Section 01 33 00 – Submittal Procedures.
 - .1 Submit 300 mm x 300 mm size of each glazing type. Consultant reserves the right to change type and colour of glass after review of submitted samples.
- .4 Certificates: Submit proof of FGIA (formerly IGMAC) certification for insulating glass units, including component codes.
- .5 Manufacturer's Instructions: Submit manufacturer's installation instructions.
- .6 LEED Submittals: provide LEED submittals in accordance with Section 01 61 01 - LEED Product Requirements.

1.5 CLOSEOUT SUBMITTALS

- .1 Provide maintenance data including cleaning instructions for incorporation into manual specified in Section 01 78 00 - Closeout Submittals.

1.6 QUALITY ASSURANCE

- .1 Manufacturer's technical recommendations:

- .1 Perform glazing work in accordance with written recommendations from the glass manufacturer or glass fabricator.
- .2 Certify glass compatibility with glazing materials (i.e. insulating glass sealants, structural sealants and silicones, gaskets, setting blocks, etc.).
- .3 Designs to be analyzed for thermal stress and wind/snow loads.
- .4 Provide shop inspection for glass.
- .2 Window fabricator qualifications: shall be a member in good standing of the Ontario Glass And Metal Association (OGMA) and adhere to the rules and regulations for workmanship, training and personnel as set forth by the association.
- .3 Test Reports: certified test reports showing compliance with specified performance characteristics and physical properties.
 - .1 Provide testing and analysis of glass under provisions of Section 01 45 00 - Quality Control.
 - .2 Provide shop inspection and testing for glass.
- .4 Certificates: product certificates signed by manufacturer certifying materials comply with specified performance characteristics and criteria and physical requirements.
- .5 Glass panels in doors, lites and windows shall have a permanent label located in the lower right-hand side of the glass unit in accordance with CAN/CGSB-12.1
- .6 Glazing for Fire-Rated Door and Window Assemblies: Glass tested per NFPA (Fire) 252 and NFPA (Fire) 257, as applicable, for assemblies complying with NFPA 80 and listed and labelled per requirements of authorities having jurisdiction.
- .7 Tempered glass shall be heat soaked in accordance with EN 14179-1 and EN 14179-2 for the following applications: railings, balustrades, exposed overhead locations, exterior exposures one or more storeys above pedestrian areas, heavy tempered glass, fabricated glass with cut outs, notches, holes or countersinks. Provide manufacturer's factory label on each unit confirming tempered glass has been heat soaked.

1.7 SITE CONDITIONS

- .1 Install glazing when ambient temperature is 4 degrees C minimum. Maintain ventilated environment for 24 hours after application.
- .2 Maintain minimum ambient temperature before, during and 24 hours after installation of glazing compounds.

1.8 DELIVERY, STORAGE, AND HANDLING

- .1 Section 01 61 00 - Common Product Requirements.
- .2 Coordinate Work of this Section with Work of other Sections so as not to delay construction schedule.
- .3 Deliver, store and handle all components to prevent damage.
- .4 Provide secure, temporary, dry enclosed structure for storage of glass units.
- .5 All individual cases of glass to be secured, blocked and braced to prevent falls.

- .6 Replace any broken, scratched, or damaged materials at Contractor's expense.
- .7 Protect all exposed surfaces from stain, discolouration, corrosion, and other abuse.
- .8 Packaging Waste Management
 - .1 Separate and recycle waste materials in accordance with Section 01 74 19 – Construction Waste Management.

1.9 WARRANTY

- .1 Provide manufacturers guarantee for the following types of glass listed, against defects in materials and workmanship for the period indicated, commencing from the date of Substantial Performance of Work.
 - .1 Sealed Glass Units: Replace units that exhibit failure of hermetic seal under normal use evidenced by the obstruction of vision by dust, moisture, or film on interior surface of glass: Ten Years.
 - .2 Coated- Glass: Replace units that display peeling, cracking, and other deterioration in metallic coating under normal use: Ten Years.
 - .3 Laminated Glass: Replace units that display edge separation, delamination, and blemishes exceeding those allowed by ASTM C1172: 5 Years.
 - .4 Provide warranty for glazing to include in maintenance manuals as specified in Section 01 78 00 – Closeout Submittals.

Part 2 Products

2.1 MANUFACTURERS

- .1 Basis of Design products are named in this Section; additional manufacturers offering similar setting systems may be incorporated into the work provided they meet the performance requirements established by the named products.
- .2 Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - .1 Vision Glass:
 - .1 AGC Flat Glass North America (formerly AFG or AFGD).
 - .2 AHC Glass (formerly Visteon).
 - .3 Cardinal Glass Industries Inc.
 - .4 Guardian Glass.
 - .5 Hartung Glass Industries
 - .6 Pilkington Glass of Canada.
 - .7 Prelco Inc.
 - .8 Vitro Architectural Glass (formerly PPG Industries).
 - .9 Schott Glass AG.

2.2 PERFORMANCE / DESIGN CRITERIA

- .1 Provide continuity of building enclosure vapour and air barrier using glass and glazing materials as follow:

- .1 Utilize inner light of multiple light sealed units for continuity of air and vapour seal.
- .2 Size glass to withstand wind loads, dead loads and positive and negative live loads as measured in accordance with ANSI/ASTM E330/E330M and in accordance with CAN/CGSB-12.20.
- .3 Limit center-of-glass deflection to the smallest of:
 - .1 Displacement associated with the structural capacity of the glazing unit.
 - .2 $L/100$, where L is the shortest side dimension of the unit measured in inches.
 - .3 Or 19 mm.

2.3 MATERIALS

- .1 Tempered Safety Glass: to CAN/CGSB-12.1, transparent, 6 mm minimum thickness.
 - .1 Type: 2-tempered.
 - .2 Class: B-float.
 - .3 Category: II – 540 J impact resistance.
- .2 Laminated Safety Glass: to CAN/CGSB-12.1, transparent, thickness as directed.
 - .1 Type: 1-laminated, tempered.
 - .2 Class: B-float.
 - .3 Category: II – 540 J impact resistance.
 - .4 Laminating Film:
 - .1 Material: Polyvinyl Butyral (PVB)
 - .2 Minimum film thickness: 1.14 mm
 - .3 Colour: Clear as indicated on Drawings.
- .3 Spandrel glass: to CAN/CGSB-12.9, minimum 6 mm thick.
 - .1 Type: 1-Tempered
 - .2 Class: A-Float
 - .3 Style: 3-Organic – applied silicone elastomeric coated.
 - .4 Form: I-Insulating glass unit
 - .5 Colour: as indicated on Drawings.
 - .6 Acceptable Materials:
 - .1 Opaci-Coat 300, ICD.
 - .2 Span-Kote.
- .4 Fire Rated Glass: Comprised of multiple layers of tempered glass ceramic, laminated with transparent intumescent materials, providing distortion free viewing through pane and as follows:
 - .1 Thickness: As required by manufacturer to meet structural requirements for performance range specified.
 - .2 Impact Safety Rating: Category I, 665 J/m in accordance with ANSI Z97.1.
 - .3 Temperature Rise Rating: Not required.

- .4 Fire Rating: As indicated in door and frame schedule.
- .5 Labelled: Permanent logo listing name of product, manufacturer, testing laboratory, fire rating period and safety requirements.
- .6 Acceptable Manufacturers:
 - .1 InterEdge Technologies.
 - .2 SAFTI Fire and Safety Rated Glass.
 - .3 Saint-Gobain Glass Solutions.
 - .4 Technical Glass Products.
- .5 Frit Glass Coating: In accordance with CAN/CGSB-12.13 and as follows:
 - .1 Tempered glass unit with Duranar DTG 2-coat system, on second surface, pattern and colour as indicated on Drawings with high opacity white frit factory applied oven baked Fluoropolymer finish as supplied by PPG Canada Inc.
 - .2 Acceptable Applicators:
 - .1 Durapaints Inc.
 - .2 Goldray Corporation.
 - .3 Garibaldi Glass Industries Inc.
- .6 Low Emissivity (Low E) Glass: to CAN/CGSB-12.10, thickness as indicated and as follows:
 - .1 Metallic coating: soft, sputtered.
 - .2 Basis-of-Design Materials:
 - .1 Planitherm XN II, Saint-Gobain Glass.

2.4 MATERIALS: SEALED INSULATING GLASS

- .1 Drawings and Specifications for insulated glass units are intended to show design concept, configuration, components and arrangement; they are not intended to identify nor solve completely the problems from thermal stress. Insulating glass units shall withstand thermal stresses created by shadowing of exterior components or assembly and elevated interstitial space temperatures. Glass thermal stress analysis shall be provided by Contractor.
- .2 Triple Pane Insulating Glass Units: meet or exceed requirements of CAN/CGSB-12.8. Units shall be certified by the Fenestration and Glazing Industry Alliance (FGIA), (formerly Insulated Glass Manufacturers Alliance (IGMA)). Overall unit thickness shall be 54 mm using 6 mm glass thickness for individual panes. Use two stage seal method of manufacture, as follows:
 - .1 Primary Seal: polyisobutylene sealing compound between glass and metal spacer/separator, super spacer bar or TDSE Intercept.
 - .2 Secondary Seal: silicone base sealant, completely filling gap between the two lites of glass at the edge up to the spacer/separator and primary seal.
- .3 Spacer/separator to provide continuous vapour barrier between interior of sealed unit and secondary seal.
- .4 Clear Float Glass: to CAN/CGSB-12.3, glazing quality, for inner lite and exterior lite above 2133 mm a.f.f. and as indicated on Drawings.

- .5 Clear Safety Glass: to CAN/CGSB-12.1 for outer lite below 2133 mm above floor finish, as indicated on Drawings and as follows:
 - .1 Type: Two-tempered.
 - .2 Class: B-float.
- .6 Provide low-E coating on No.2 and No.5 surfaces of triple glazed insulating glass units.
- .7 Gas: 95% Argon filled.
- .8 Other Glazing Accessories: setting blocks to CAN/CSA-A440.

2.5 ACCESSORIES

- .1 Sealant: in accordance with Section 07 92 00 – Sealants.
- .2 Setting blocks: Neoprene, EPDM, or Silicone, 80-90 Shore A durometer hardness to ASTM D2240, to suit glazing method, glass light weight and area.
- .3 Spacer shims: Neoprene or Silicone, 50-60 Shore A durometer hardness to ASTM D2240, 75 mm long x one half height of glazing stop x thickness to suit application. Self adhesive on one face.
- .4 Glazing tape:
 - .1 Preformed butyl compound with integral resilient tube spacing device, ten-fifteen Shore A durometer hardness to ASTM D2240; coiled on release paper; black colour.
 - .2 Closed cell polyvinyl chloride foam, coiled on release paper over adhesive on two sides, maximum water absorption by volume 2%, designed for compression of 25%, to effect an air and vapour seal.
- .5 Glazing compound for fire rated glazing materials:
 - .1 Glazing Tape: Closed cell polyvinyl chloride foam, coiled on release paper over adhesive on two sides, maximum water absorption by volume of 2%, designed for compression of 25% to effect an air and vapour seal.
 - .2 Silicone Sealant: One-part neutral curing silicone, medium modulus sealant, Type S; Grade NS; Class 25 with additional movement capability of 50% in both extension and compression (total 100%); Use (Exposure) NT; Uses (Substrates) G, A, and O as applicable.
 - .1 Acceptable materials:
 - .1 Dow Corning 795, Dow Corning Corp.
 - .2 Silglaze-II 2800, General Electric Co.
 - .3 Spectrum 2, Tremco Inc.
 - .3 Setting Blocks: Hardwood, glass width by 100 mm x 5 mm thick.
 - .4 Spacers: Neoprene or other resilient blocks of 40 to 50 Shore A durometer hardness, adhesive-backed on one face only, tested for compatibility with specified glazing compound.
 - .5 Cleaners, Primers, and Sealers: Type recommended by manufacturer of glass and gaskets.
- .6 Glazing splines: resilient polyvinyl chloride or silicone, extruded shape to suit glazing channel retaining slot, black colour.

- .7 Glazing clips: manufacturer's standard type.
- .8 Screws, bolts and fasteners: Type 304 stainless steel.
- .9 Glass presence markers: easily removable, non-residue depositing.
- .10 Lock-strip gaskets: to ASTM C542.

2.6 FABRICATION

- .1 Verify glazing dimensions on Site.
- .2 Clearly label each glass light with maker's name, weight, quality, type and certification number. Do not remove labels until after work has been reviewed by Engineer.
- .3 Accurately size glass to fit openings allowing the clearances shown on the following tables:

.1 Minimum glass clearances:

	Thickness	Edge Clearance	Face Clearance
(1)	2 mm	3 mm (a)	1.5 mm
(2)	3 mm	3 mm (a)	3 mm
(3)	4 mm	3 mm (a)	3 mm
(4)	5 mm	3 mm (a)	3 mm
(5)	6 mm	5 mm	3 mm
(6)	6 mm	6 mm	3 mm
(7)	over 6 mm	6 mm or 3/4 times the glass thickness, whichever is greater	

(a) where any dimension of glass exceeds 760 mm increase minimum edge clearance by 1.5 mm.

- .4 Bite of glass edge on stop:
 - .1 Up to 1270 mm united size: 6 mm minimum.
 - .2 1270 mm to 2540 mm united size: 10 mm minimum.
 - .3 Over 2540 mm united size: 13 mm minimum.

Part 3 Execution

3.1 EXAMINATION

- .1 Verify that openings for glazing are correctly sized and within tolerance.
- .2 Verify that surfaces of glazing channels or recesses are clean, free of obstructions, and ready to receive glazing.

3.2 PREPARATION

- .1 Ensure all wood backing rebates and stops properly primed and finished, coordinate with Section 06 40 00 – Architectural Woodwork.
- .2 Ensure all glazing rebates smooth and true, free of projections nails, screws, fastenings properly set to prevent contact with glass.

- .3 Ensure all stops, splines, glazing accessories provided are accurately cut to length and proper size and type for specific glazing.
- .4 Clean contact surfaces with solvent and wipe dry.
- .5 Seal porous glazing channels or recesses with substrate compatible primer or sealer.
- .6 Prime surfaces scheduled to receive sealant.

3.3 GENERAL INSTALLATION

- .1 Install work in accordance with the Quality Management provisions specified in this section and manufacturer's written instructions.
- .2 Size glass to Code requirements and verify glass for openings are correctly sized and are within allowable tolerances. Install glass with full contact and adhesion at perimeter. Maintain edge clearance recommended by glass manufacturer.
- .3 Compliance: Comply with manufacturer's written data, including product technical bulletins, product catalogue installation instructions, product carton installation instructions, and data sheets.
- .4 Remove and replace glazing stops in original locations, using original fasteners, securely set and undamaged.
- .5 Use setting blocks, spacers and, for wet glazing, shims, as required to properly support the glass, centred in place in the glazing space independent of the glazing materials and to uniformly distribute its load.
- .6 Use a minimum of two setting blocks, located at the quarter points. Locate spacers at jamb edges of glass, uniformly spaced at 600 mm o.c. maximum, and 300 mm maximum from top to bottom.
- .7 Handle and install heat absorbing glass in accordance with manufacturer's directions.
- .8 Prevent nicks, abrasion and other damage likely to develop stress on edges.
- .9 Set glass properly centred with uniform bite and face and edge clearance, free from twist, warp or other distortion likely to develop stress.
- .10 Trim tape protruding more than 2 mm above stop.
- .11 Leave labels on glass until it has been set and inspected and accepted. Leave glass whole and without cracks, scratches or other defects and with settings in perfect condition at completion. Remove rejected, broken or damaged glass due to defective materials or improper setting and replace with acceptable materials. Units producing distorted vision shall be rejected and replaced at no cost to the Owner.
- .12 Remove, dispose of, and replace broken, cut and abraded glass.
- .13 Install glass presence markers in two cross stripes extending from diagonal corners. Maintain markers until final clean-up.

3.4 EXTERIOR

- .1 Arrange for installed glass to have labels facing the interior. Ensure that sufficient space is left within the glazing space to allow thermal movement of glass without imposing stress on the glass.

- .2 Install curtain wall glazing to Section 08 44 13 - Glazed Aluminum Curtain Walls, and as follows:
 - .1 Perform work in accordance with GANA Glazing Manual.
 - .2 Cut glazing spline to length; install on glazing light. Seal corners by butting spline and sealing junctions with sealant.
 - .3 Place setting blocks at one third points, with edge block maximum 150 mm from corners.
 - .4 Rest glazing on setting blocks and push against fixed stop with sufficient pressure to attain full contact.
 - .5 Install removable stops without displacing glazing spline. Exert pressure for full continuous contact.
 - .6 Trim protruding tape edge.
- .3 Install pressed steel frame and hollow steel door glazing as follows:
 - .1 Perform work in accordance GANA Glazing Manual.
 - .2 Cut glazing tape to length and set against permanent stops, 6 mm below sight line. Seal corners by butting tape and dabbing with sealant.
 - .3 Apply heel bead of sealant along intersection of permanent stop with frame ensuring full perimeter seal between glass and frame to complete continuity of air and vapour seal.
 - .4 Place setting blocks at one third points, with edge block maximum 150 mm from corners.
 - .5 Rest glazing on setting blocks and push against tape and heel head of sealant with sufficient pressure to attain full contact at perimeter of light or glass unit.
 - .6 Install removable stops with spacer strips inserted between glazing and applied stops, 6 mm below sight line.
 - .7 Fill gap between glazing and stop with sealant to depth equal to bite of frame on glazing, maximum 9 mm below sight line.
 - .8 Apply cap head of sealant along void between stop and glazing, to uniform line, flush with sight line. Tool or wipe sealant surface smooth.

3.5 INTERIOR

- .1 Glazing materials and installation to meet Ontario Building Code requirements for fire rated separations where required; refer to drawings for locations of fire-rated separations.
- .2 Arrange for installed glass to have labels facing the interior. Ensure that sufficient space is left within the glazing space to allow thermal movement of glass without imposing stress on the glass.
- .3 Provide insulating glass units in sound attenuated partitions.
- .4 Unless otherwise specified or indicated, interior glazing shall be dry glazing.
- .5 Install extruded resilient channel gasket around entire perimeter of glass. Make tight butt joint at corners of lights. Place setting blocks at sill and spacers at both jambs as required to centre the unit in the frame. Place the unit into the frames and apply the stops against the gaskets. Tighten the screws or clips to obtain positive uniform pressure avoiding excessive pressure.

- .6 Ensure rattle free cushioning.
- .7 Install spacer shims at 600 mm o.c. to centre balustrade glazing in rebate space. Install shims 6 mm below sight line. Apply cap bead of glazing sealant to uniform line, flush with rebate sightline and tool to smooth appearance, both sides.
- .8 Install two-sided frameless structural butt joint glass assemblies where indicated using tempered safety glass with slightly wet grinded kerf and polished butt-joint edges for aesthetics. Ensure precise levelling of sill member achieved and provision made at head to accommodate deflection of structure. For glazing at head and sill use wet, dry, or wet/dry glazing systems. Position glazing so vertical edges spaced slightly apart and seal with clear, colourless, or coloured silicone sealant. At framing or rebate locations, provide silicone sealant in clear, colourless, or colour selected by Consultant. Ensure sealant flush with and does not protrude above glazing stop or rebate.
- .9 Install wet glazing materials to obtain complete contact and adhesion over the full bite area of the unit and to be free from gaps, air bubbles and embedded foreign matter. Use primers where recommended by the glazing material manufacturer. Use sufficient bedding compound so that when glass is pressed into place, excess compound is forced well out around entire margin. Use shims to ensure maintenance of uniform face clearance. Where required on both sides of a unit, make shims coincident.
- .10 Install glazing tape to ensure complete contact and adhesion over the full bite area of the unit. Make joints only at corners of the unit. Use preshimmed glazing tape at glass installed with pressure plates. Fit tape accurately with tight joints, free from tension, gaps and cracks. After installation of the glass, the glazing tape shall not extend more than 3 mm above the line of the fixed stop. Remove and reglaze units where the glazing tape exceeds this tolerance.
- .11 Gun in a heel bead of glazing compound ensuring a continuous seal between glazed element and frame.
- .12 Finish gunned bead surfaces uniformly smooth and straight, to slope away from glass.

3.6 INSTALLATION - FIRE RATED GLASS

- .1 Comply with GANA standards and instructions of manufacturers of glass, glazing sealants, and glazing compounds.
- .2 Protect glass from edge damage during handling and installation. Inspect glass during installation and discard pieces with edge damage that could affect glass performance.
- .3 Place hardwood setting blocks located at quarter points of glass with edge block no more than 150 mm from corners.
- .4 Glaze vertically into labelled fire rated steel frames or partition walls with same fire rating as glass and push against tape for full contact at perimeter of pane or unit.
- .5 Place glazing tape on free perimeter of glazing in same manner described above.
- .6 Do not remove protective edge tape.
- .7 Install removable stop and secure without displacement of tape.

- .8 Do not pressure glaze.
- .9 Knife trim protruding tape.
- .10 Provide minimum 5 mm edge clearance.
- .11 Install vision panels in fire rated doors to requirements of NFPA (Fire) 80.
- .12 Install so that appropriate fire rating labels and markings remain permanently visible.

3.7 CLEANING

- .1 At completion of Work, remove and dispose of all protections, clean down all exposed aluminum surfaces, replace all damaged members, including members with damaged finishes.
- .2 Perform cleaning after installation to remove construction and accumulated environmental dirt.
- .3 Remove traces of primer, caulking.
- .4 Remove glazing materials from finish surfaces.
- .5 Remove labels after work is complete.
- .6 Clean glass using approved non-abrasive cleaner in accordance with manufacture's instructions.
- .7 Upon completion of installation, remove surplus materials, rubbish, tools and equipment barriers.

3.8 PROTECTION OF FINISHED WORK

- .1 After installation, mark light with an "X" by using removable plastic tape or paste. Do not mark heat absorbing or reflective glass units.

3.9 SCHEDULE

- .1 Aluminum Windows:
 - .1 GL-2 (54 mm):
 - .1 Exterior Lite: 6 mm Planiclear Tempered: Planitherm XN II (#2)
 - .2 Airspace: 18 mm Black Swisspacer Ultimate, with 90% Argon gas
 - .3 Middle Lite: 6 mm Parsol Grey Tempered
 - .4 Airspace: 18 mm Black Swisspacer Ultimate, with 90% Argon gas
 - .5 Interior Lite: 6 mm Planiclear Tempered: Planitherm XN II (#5).
 - .2 Spandrel: triple glazed same as above, grey back painted #5 glass, with mineral fibre in aluminum backpan.
- .2 Aluminum Doors:
 - .1 GL-1 (61 mm):
 - .1 Exterior Lite: 6 mm Planiclear Laminated Tempered: 4Bird Etch (4BE01) Planitherm XN II (#1) /PVB/ Planiclear Tempered: Planitherm XN II (#4).
 - .2 Airspace: 18 mm Black Swisspacer Ultimate, with 90% Argon gas
 - .3 Middle Lite: 6 mm Parsol Grey Tempered

- .4 Airspace: 18 mm Black Swisspacer Ultimate, with 90% Argon gas
- .5 Interior Lite: 6 mm Planiclear Tempered: Planitherm XN II (#7)
- .3 Hollow Steel Doors and Borrowed Lights:
 - .1 Interior Doors:
 - .1 Single pane 6 mm tempered safety glazing.
 - .2 Single 6 mm clear fire rated glazed light, as indicated.
 - .4 Borrowed Light in Pressed Steel Frames:
 - .1 Single 6 mm clear tempered safety glazed units.
 - .2 Single 6 mm clear fire rated glazed light, as indicated.
 - .5 Other glass types as indicated on Drawings.

END OF SECTION

Part 1 General

1.1 SUMMARY

- .1 Section Includes:
 - .1 Translucent glazing film.
 - .2 Glazing film accessories.
- .2 Related Requirements:
 - .1 Section 08 80 50 – Glazing
 - .2 Section 10 22 23 – Moveable Partition System

1.2 REFERENCES

- .1 Reference Standards:
 - .1 American National Standards Institute (ANSI):
 - .1 ANSI Z97.1-2015 (R2020), Safety Glazing Materials Used in Buildings - Safety Performance Specifications and Methods of Test.
 - .2 American Society for Testing and Materials International (ASTM):
 - .1 ASTM D1004-21, Standard Test Method for Tear Resistance (Graves Tear) of Plastic Film and Sheeting.
 - .2 ASTM D3330/D3330M-04(2018), Standard Test Method for Peel Adhesion of Pressure-Sensitive Tape.
 - .3 ASTM E84-23d, Standard Test Method for Surface Burning Characteristics of Building Materials.

 - .6 International Window Film Association (IWFA):
 - .1 IWFA Architectural Visual Inspection Standard Window Film.

1.3 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Submit product data in accordance with Section 01 33 00 – Submittal Procedures:
 - .1 Submit WHMIS SDS - Safety Data Sheets in accordance with WHMIS acceptable to Labour Canada, and Health and Welfare Canada.
- .2 Submit samples in accordance with Section 01 33 00 – Submittal Procedures:
 - .1 Submit one 500 x 500 mm sample of glazing film of each product colour specified.

- .3 LEED Submittals: provide LEED submittals in accordance with Section 01 61 01 - LEED Product Requirements.

1.4 CLOSEOUT SUBMITTALS

- .1 Submit Closeout Submittals in accordance with Section 01 78 00 - Closeout Submittals.
 - .1 Provide operation and maintenance data for window film for incorporation into manual specified in Section 01 78 00 - Closeout Submittals.
 - .2 Follow manufacturers written instructions for care and maintenance of security and safety film.
 - .3 Use only cleaning solution recommended by manufacturer for regularly scheduled cleaning of security film.

1.5 QUALITY ASSURANCE

- .1 Film installation Subcontractor to be factory approved and have a minimum of three years documented experience on not less than five similar installations.
- .2 Comply with requirements of the International Window Film Association (IWFA).
- .3 Use adequate numbers of skilled workmen, thoroughly trained and experienced in the installation of this film system.

1.6 DELIVERY, STORAGE, AND HANDLING

- .1 Deliver, store and handle materials in accordance with section 01 61 01 - LEED Product Requirements.
- .2 Provide and maintain dry, off-ground weatherproof storage.
- .3 Store rolls of film flat on cross supports. Do not stand rolls of film on end.
- .4 Remove from storage, in quantities required for same day use.
- .5 Store materials in accordance with manufacturers written instructions.
- .6 Packaging Waste Management
 - .1 Separate and recycle waste materials in accordance with Section 01 74 19 – Construction Waste Management.

1.7 WARRANTY

- .1 Contractor hereby warrants that Security and Safety Film will stay in place without delaminating, peeling or blistering in accordance with the Contract, but for ten years.
- .2 Ensure warranty includes items as follows:
 - .1 Maintaining adhesion properties without blistering, bubbling or delaminating from glass surface.
 - .2 Maintaining appearance without discolouration.
 - .3 Removing, replace and reapply defective materials.

Part 2 Products

2.1 MATERIALS

- .1 Translucent Glazing Film (WF1): Vinyl film, adhered to face of glass, computer generated and cut:
 - .1 Flammability: Surface burning characteristics when tested in accordance ASTM E84, demonstrating film applied to glass rated Class A for Interior Use:
 - .1 Flame Spread Index: no greater than 25.
 - .2 Smoke Developed Index: no greater than 55.
 - .2 Pattern and Colour: as indicated in Section 09 99 99 – Material List.
 - .3 Basis-of-Design Manufacturer: as indicated in Section 09 99 99 – Material List.

2.2 GLAZING FILM ACCESSORIES

- .1 Adhesive: pressure sensitive acrylic adhesive system.
- .2 Cleaners, primers and sealers: types as recommended by glazing film manufacturer.

Part 3 Execution

3.1 PREPARATION

- .1 Clean glass before beginning installation using neutral cleaning solution.
- .2 Ensure no deleterious material adheres to glass by scraping surface of glass using industrial razors.
- .3 Ensure dust, grease, and chemical residue are removed from surface of glass before installation of film.
- .4 Examine glass under natural daylight and identify cracks, blisters, bubbles, discolouration, edge defects or other anomalies that may cause film to delaminate or cause vision transparency or distortion problems. Report findings to Consultant.
- .5 Before beginning Work, place absorbent material on window sill or at sash frame to absorb moisture accumulation generated by film application.

3.2 INSTALLATION

- .1 Comply with glazing film manufacturer's written installation instructions.
- .2 Cut film edges straight and square.
- .3 Cut edges 3 mm maximum from edge of glass sealing device in accordance with manufacturers written instructions.
- .4 Apply and attach film to glass in accordance with manufacturer's written instructions.
- .5 Splicing:
 - .1 Splice film only when glass is greater in width than film.

- .2 Splice film only after receipt of written approval from Consultant.
- .3 Use butt factory edges only.
- .4 Install with no gaps or overlaps.
- .6 Use only water and film slip solution on glass to facilitate positioning of film.
- .7 Ensure removal of excess water from between film and glass.
- .8 Remove left over material from work area and return work area to original condition.

3.3 SITE QUALITY CONTROL

- .1 Installer's Inspection: Visual Inspection: in accordance with IWFA – Architectural Visual Inspection Standard Window Film.
- .2 Remove and replace film that continues to show blisters, bubbles, tears, scratches, edge defects or vision distortion in film when viewed under natural daylight from 2 m minimum after 30 day period.

3.4 CLEANING

- .1 Follow manufacturer's recommendations and instructions for all cleaning procedures.

END OF SECTION

Part 1 General

1.1 SUMMARY

- .1 Section Includes:
 - .1 Interior gypsum wallboard of all types.
 - .2 Exterior gypsum board panels for ceilings and soffits. Metal furring runners
 - .4 Drywall furring channels
 - .5 Resilient clips
 - .6 Mineral fiber acoustical insulation
 - .7 Fibrous Glass Acoustical Insulation
 - .8 Ceiling/wall access doors
 - .9 Accessories such as nails, screws, adhesives, casing beads, caps, mouldings, sealants, trims, gaskets and joint treatments.
- .2 Related Requirements:
 - .1 Section 06 10 00 – Rough Carpentry
 - .2 Section 07 27 19 – Sheet Membrane Air and Vapour Barrier
 - .3 Section 07 84 00 – Firestopping and Smoke seals
 - .4 Section 07 92 00 – Sealants
 - .5 Section 09 22 00 – Non-Structural Metal Framing
 - .6 Section 09 30 13 – Tiling
 - .7 Section 09 91 00 – Painting

 - .3 ULC 702.1, Standard for Thermal Insulation Mineral Fibre for Buildings, Part 1: Material Specification (ULC S702.1).

1.3 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Submit product data in accordance with Section 01 33 00 – Submittal Procedures:
 - .1 Submit manufacturer's printed product literature, specifications and data sheet for each product specified.
- .2 LEED Submittals: provide submittals in accordance with Section 01 61 01 – LEED Product Requirements.

1.4 DELIVERY, STORAGE, AND HANDLING

- .1 Deliver materials in original packages, containers or bundles bearing manufacturers brand name and identification.
- .2 Store materials inside, level, under cover. Keep dry. Protect from weather, other elements and damage from construction operations and other causes.
- .3 Handle gypsum boards to prevent damage to edges, ends or surfaces. Protect metal accessories and trim from being bent or damaged.

- .4 Packaging Waste Management
 - .1 Separate and recycle waste materials in accordance with Section 01 74 19 – Construction Waste Management.

1.5 SITE CONDITIONS

- .1 Ambient Conditions:
 - .1 Maintain temperature minimum 10 degrees C, maximum 21 degrees C for 48 hours prior to and during application of gypsum boards and joint treatment, and for at least 48 hours after completion of joint treatment.
 - .2 Apply board and joint treatment to dry, frost free surfaces.
 - .3 Ventilation: Ventilate building spaces as required to remove excess moisture that would prevent drying of joint treatment material immediately after its application.

Part 2 Products

2.1 MANUFACTURERS

- .1 Acceptable Manufacturers:
 - .1 Cabot Gypsum Company
 - .2 CertainTeed Gypsum Canada Inc.
 - .3 CGC Inc.
 - .4 Georgia-Pacific Canada, Inc.

2.2 GYPSUM MATERIALS

- .1 Standard board: to ASTM C1396/C1396M and as follows:
 - .1 Type: regular and fire resistant.
 - .2 Size: 1220 mm x maximum practical length.
 - .3 Thickness: as indicated on Drawings.
 - .4 Ends: square cut.
 - .5 Edges: tapered
 - .6 Acceptable Materials:
 - .1 Wallboard (Type X), CertainTeed.
 - .2 Sheetrock (Firecode), CGC Inc.
 - .3 Toughrock Gypsum Wallboard (Fireguard), Georgia-Pacific Canada, Inc.
- .2 Lightweight Fire Resistant board: to ASTM C1396/C1396M and as follows:
 - .1 Type: fire resistant.
 - .2 Size: 1220 mm x maximum practical length.
 - .3 Thickness: as indicated on Drawings.
 - .4 Ends: square cut.
 - .5 Edges: tapered.
 - .6 Basis-of-Design Materials:

- .1 Ultralight Panels Firecode X, CGC Sheetrock.
- .3 Sag Resistant Gypsum Board: to ASTM C1396/C1396M and as follows:
 - .1 Type: regular.
 - .2 Thickness: as indicated on Drawings.
 - .3 Acceptable Materials:
 - .1 Interior Ceiling Board, CertainTeed.
 - .2 Sheetrock Interior Ceiling Board, CGC Inc.
 - .3 CD Ceiling Board, Georgia-Pacific Canada, Inc.
 - .4 Cementitious backer board: to ASTM C1325 and as follows:
 - .1 Size: 1220 mm x maximum practical length.
 - .2 Thickness: as indicated on Drawings.
 - .3 Acceptable Materials:
 - .1 Durock, CGC Inc.
 - .2 Wonderboard, Custom Building Products Ltd.

2.3 FRAMING MATERIALS

- .1 Studs and Tracks: as indicated in Section 09 22 00 - Non-Structural Metal Framing.
- .2 Metal furring runners, hangers, tie wires, inserts, anchors.
- .3 Drywall furring channels: 0.75 mm core thickness galvanized steel channels for screw attachment of gypsum board.
- .4 Resilient drywall furring: 0.5 mm base steel thickness galvanized steel for resilient attachment of gypsum board.

2.4 INSULATION MATERIALS

- .1 Mineral Fiber Insulation for Fire and Smoke Rated Assemblies: Un-faced preformed GreenGuard™ or formaldehyde free binder stone wool insulation meeting the requirements of ULC 702.1; having maximum flame spread and smoke developed of 0/0 in accordance with ULC 102 and ASTM E84 and being non-combustible in accordance with ULC 114 and as follows:
 - .1 Type: 1 to ASTM C665.
 - .2 Width: to friction fit in stud spaces.
 - .3 Thickness: to fill a minimum of 90% of the cavity thickness.
 - .4 STC Ratings: as indicated on Drawings.
 - .5 Acceptable Materials:
 - .1 Thermafiber SAFB, Owens-Corning Canada Inc.,
 - .2 AFB Acoustical Fire Batt, Rockwool Inc.
- .2 Fibrous Glass Acoustical Insulation for Non-rated Assemblies: Un-faced, preformed GreenGuard™ or formaldehyde free binder fibrous insulation meeting the requirements of ASTM C423, ASTM E90, ASTM E413 and ULC 702.1 and as follows:
 - .1 Type: One.

- .2 Width: to friction fit in stud spaces.
- .3 Thickness: to fill a minimum of 90% of the cavity thickness.
- .4 Acceptable Materials:
 - .1 NoiseReducer, Sound Control Fibre Glass Batts, CertainTeed.
 - .2 Sound Shield Glass Fibre Batts, Johns Manville.
 - .3 Quietzone Acoustic Insulation, Owen-Corning Canada Inc.

2.5 CEILING/WALL ACCESS DOORS

- .1 Architectural, flush mounting access panels for gypsum board installation, thickness and fire rating to match wall assembly, manufacturer's standard sizes selected to suit access requirements, complete with extruded aluminum frame, concealed hinge and a removable door panel, air tight gasket and screwdriver slot latch mechanism. Confirm proposed location and number of access doors with Consultant prior to installation.
 - .1 Non-Rated Access Doors and Frames:
 - .1 Concealed Flange Access Panel: Flush design frame with a drywall bead taping flange, specifically for use with gypsum board.
 - .1 Frame: 1.90 mm (14 gauge) galvanized steel.
 - .2 Door Panel: 1.52 mm (16 gauge) galvanized steel.
 - .3 Hinge: Fully concealed pin type hinge with 175 degree opening.
 - .4 Latch: Screwdriver operated cam latch.
 - .2 Exterior Flange Stainless Steel Access Panel: Surface mounted with exposed flange frame design. No. 4 polished finish 304 stainless steel.
 - .1 Frame: 1.21 mm (18 gauge) stainless steel.
 - .2 Door Panel: 1.52 mm (16 gauge) stainless steel.
 - .3 Hinge: Fully concealed pin type hinge with 175 degree opening.
 - .4 Latch: Screwdriver operated cam latch.
 - .2 Fire-Rated Access Doors and Frames:
 - .1 Concealed Flange Fire-Rated Wall Access Panel: Flush design frame with a drywall bead taping flange, specifically for use with gypsum board.
 - .1 Frame: 1.61 mm (14 gauge) galvanized steel.
 - .2 Door Panel: 1.99 mm (16 gauge) galvanized steel, uninsulated.
 - .3 Hinge: Fully concealed pin type hinge with 90 degree opening, self-closing device. Latch: Allen key operated latch with interior latch release.
 - .4 Rating: as indicated.
 - .2 Concealed Flange Fire-Rated Ceiling Access Panel: Flush design frame with a drywall bead taping flange, specifically for use with gypsum board.
 - .1 Frame: 1.99 mm (16 gauge) galvanized steel.
 - .2 Door Panel: 1.31 mm (18 gauge) galvanized steel, with high temperature insulation and 0.85 mm (22 gauge) metal liner.

- .3 Hinge: Fully concealed pin type hinge with 90 degree opening, self-closing device.
- .4 Latch: Allen key operated latch with interior latch release.
- .5 Rating: as indicated.
- .3 Acceptable Manufacturers:
 - .1 Access Panel Solutions.
 - .2 Acudor Products, Inc.
 - .3 Bauco Access Panel Solutions
 - .4 Chicago Metallic/Rockfon Corporation.
 - .5 Nystrom Building Products Co.

2.6 FINISHES

- .1 Paint: in accordance with Section 09 91 00 – Painting.
- .2 Tiling: in accordance with Section 09 30 13 – Tiling.

2.7 ACCESSORIES

- .1 Nails: to ASTM C514.
- .2 Steel drill screws: to ASTM C1002.
- .3 Laminating compound: as recommended by manufacturer, asbestos-free.
- .4 Casing beads, corner beads, control joints and edge trim: to ASTM C1047, 0.5 mm base thickness galvanized metal to ASTM A653, perforated flanges, one piece length per location.
- .5 Strippable Edge Trim: Extruded PVC with pre-masked L-shaped tape on trim with tear away protective serrated strip for removal after compound and paint is applied, for use at areas where gypsum butts aluminum frames and where gypsum butts concrete or concrete block.
- .6 Sealants: in accordance with Section 07 92 00 - Sealants.
- .7 Acoustic sealant: in accordance with Section 07 92 00 – Sealants.
- .8 Firestopping: refer to Section 07 84 00 - Firestopping and Smoke seals for project as required for all new and existing surfaces, penetrations, irregular connections, and locations as described in Section 07 84 00 - Firestopping and Smoke seals.
- .9 Insulating strip (sill gasket): rubberized, moisture resistant 3 mm thick cork or foam strip, width to suit, with self sticking adhesive on one face, lengths as required.
- .10 Joint Treatment Materials: Provide joint compound and accessory materials in accordance with ASTM C475/C475M and as follows:
 - .1 Joint Tape:
 - .1 Interior Gypsum Board: Paper.
 - .2 Tile Backing Panels: As recommended by panel manufacturer.
 - .2 Joint Compound for Interior Gypsum Board: Vinyl based, non-asbestos, low dusting type compatible with other compounds applied on previous or for successive coats, and as follows:
 - .1 Pre-filling: Setting type taping compound.

- .2 Embedding and First Coat: Drying type compound.
- .3 Fill Coat: Drying type compound.
- .4 Finish Coat: Drying type, sandable topping compound.
- .5 Skim Coat: Drying type, sandable topping compound.
- .6 Acceptable Materials:
 - .1 CertainTeed Dust Away.
 - .2 CGC Dust Control.
- .3 Joint Compound for Tile Backing Panels:
 - .1 Gypsum based tile backing board: Use setting type taping and setting type, sandable topping compounds.

Part 3 Execution

3.1 ACOUSTIC ASSEMBLIES

- .1 Maintain continuity of acoustic rated assemblies, including at junction with dissimilar adjacent materials and components such as beams, slabs, columns above ceilings and the like.

3.2 ERECTION

- .1 Perform application and finishing of gypsum board in accordance with ASTM C840 except where specified otherwise.
- .2 Do not install gypsum based products where there will be direct exposure to water or continuous high humidity conditions.
- .3 Erect hangers and runner channels for suspended gypsum board ceilings in accordance with ASTM C840 except where specified otherwise.
- .4 Support light fixtures by providing additional ceiling suspension hangers within 150 mm of each corner and at maximum 600 mm around perimeter of fixture.
- .5 Install work level to tolerance of 1:1200.
- .6 Frame with furring channels, perimeter of openings for access panels, light fixtures, diffusers, grilles.
- .7 Install 19 x 64 mm furring channels parallel to, and at exact locations of steel stud partition header track.
- .8 Furr gypsum board faced vertical bulkheads within and at termination of ceilings.
- .9 Furr above suspended ceilings for gypsum board fire and sound stops and to form plenum areas as indicated.
- .10 Install gypsum 19 mm above finished floor at base of walls and seal joint for acoustic partitions to achieve STC rating as indicated.
- .11 Seal fire rated partitions with fire caulking as indicated in Section 07 84 00 - Firestopping and Smoke seals and authority having jurisdiction.
- .12 Install wall furring for gypsum board wall finishes in accordance with ASTM C840, except where specified otherwise.

- .13 Furr openings and around built-in equipment, cabinets, access panels, on four sides. Extend furring into reveals. Check clearances with equipment suppliers.
- .14 Furr duct shafts, beams, columns, pipes and exposed services where indicated.
- .15 Erect drywall resilient furring transversely across studs and joists spaced maximum 600 mm on centre and not more than 150 mm from ceiling/wall juncture. Secure to each support with 25 mm drywall screw.
- .16 Install 150 mm continuous strip of gypsum board along base of partitions where resilient furring installed.

3.3 APPLICATION

- .1 Do not apply gypsum board until bucks, anchors, blocking, sound attenuation, electrical and mechanical work are approved.
- .2 Apply single or double layer gypsum board to metal furring or framing using screw fasteners for first layer, screw fasteners for second layer. Maximum spacing of screws 300 mm on centre.
 - .1 Single-Layer Application:
 - .1 Apply gypsum board on ceilings prior to application of walls in accordance with ASTM C840.
 - .2 Apply gypsum board vertically or horizontally, providing sheet lengths that will minimize end joints.
 - .2 Double-Layer Application:
 - .1 Install gypsum board for base layer and exposed gypsum board for face layer.
 - .2 Apply base layer to ceilings prior to base layer application on walls; apply face layers in same sequence. Offset joints between layers at least 250 mm.
 - .3 Apply base layers at right angles to supports unless otherwise indicated.
 - .4 Apply base layer on walls and face layers vertically with joints of base layer over supports and face layer joints offset at least 250 mm with base layer joints.
- .3 Apply 12 mm diameter bead of acoustic sealant continuously around periphery of each face of partitioning to seal gypsum board/structure junction where partitions abut fixed building components in accordance with ASTM C919. Seal full perimeter of cut-outs around electrical boxes, ducts, in partitions where perimeter sealed with acoustic sealant.
- .4 Install ceiling boards in direction that will minimize number of end-butt joints. Stagger end joints at least 250 mm.
- .5 Install gypsum board on walls vertically to avoid end-butt joints. At stairwells and similar high walls, install boards horizontally with end joints staggered over studs, except where local codes or fire-rated assemblies require vertical application.
- .6 Install gypsum board with face side out.
- .7 Do not install damaged or damp boards.

- .8 Locate edge or end joints over supports. Stagger vertical joints over different studs on opposite sides of wall.

3.4 INSTALLATION

- .1 Erect accessories straight, plumb or level, rigid and at proper plane. Use full length pieces where practical. Make joints tight, accurately aligned and rigidly secured. Mitre and fit corners accurately, free from rough edges. Secure at 150 mm on centre or using contact adhesive for full length.
- .2 Install casing beads where ceilings abut dissimilar materials.
- .3 Install casing beads where gypsum board butts against surfaces having no trim concealing junction and where indicated. Seal joints with sealant.
- .4 Install insulating strips continuously at edges of gypsum board and casing beads abutting metal window and exterior door frames, to provide thermal break.
- .5 Install shadow mould at gypsum board/ceiling juncture as indicated. Minimize joints; use corner pieces and splicers.
- .6 Construct control joints of preformed units or two back-to-back casing beads set in gypsum board facing and supported independently on both sides of joint.
- .7 Provide continuous polyethylene dust barrier behind and across control joints.
- .8 Locate control joints where indicated and at changes in substrate construction at approximate 10 m spacing on long corridor runs at approximate 15 m spacing on ceilings.
- .9 Install control joints straight and true.
- .10 Construct expansion joints at building expansion and construction joints. Provide continuous dust barrier.
- .11 Install expansion joint straight and true.
- .12 Splice corners and intersections together and secure to each member with three screws.
- .13 Install access doors to electrical and mechanical fixtures specified in respective sections.
 - .1 Rigidly secure frames to furring or framing systems.
- .14 Finish face panel joints and internal angles with joint system consisting of joint compound, joint tape and taping compound installed according to manufacturer's directions and feathered out onto panel faces.
- .15 Gypsum Board Finish: finish gypsum board walls and ceilings to following levels in accordance with GA-214:
 - .1 Levels of finish (at locations below or as indicated on drawings)
 - .1 Level 0: No taping, finishing or accessories required for areas of temporary construction.
 - .2 Level One: Embed tape for joints and interior angles in joint compound. Surfaces to be free of excess joint compound; tool marks and ridges are acceptable. Use at plenum areas above ceilings, in attics, or in concealed spaces.

- .3 Level Two: Embed tape for joints and interior angles in joint compound and apply one separate coat of joint compound over joints, angles, fastener heads and accessories; surfaces free of excess joint compound; tool marks and ridges are acceptable. Use when gypsum is used as a substrate for tile.
- .4 Level Three: Embed tape for joints and interior angles in joint compound and apply two separate coats of joint compound over joints, angles, fastener heads and accessories; surfaces smooth and free of tool marks and ridges and where areas are to receive a heavy coating of textured material.
- .5 Level Four: Embed tape for joints and interior angles in joint compound and apply three separate coats of joint compound over joints, angles, fastener heads and accessories; surfaces smooth and free of tool marks and ridges and where light textures or wall coverings are to be applied.
- .16 Finish corner beads, control joints and trim as required with two coats of joint compound and one coat of taping compound, feathered out onto panel faces.
- .17 Fill screw head depressions with joint and taping compounds to bring flush with adjacent surface of gypsum board so as to be invisible after surface finish is completed.
- .18 Sand lightly to remove burred edges and other imperfections. Avoid sanding adjacent surface of board.
- .19 Completed installation to be smooth, level or plumb, free from waves and other defects and ready for surface finish.
- .20 Mix joint compound slightly thinner than for joint taping.
- .21 Apply thin coat to entire surface using trowel or drywall broadknife to fill surface texture differences, variations or tool marks.
- .22 Remove ridges by light sanding or wiping with damp cloth.
- .23 Provide protection that ensures gypsum drywall work will remain without damage or deterioration at time of Substantial Performance.

3.5 NON-CONFORMING WORK

- .1 Touch-up minor damage to finishes in accordance with manufacturer's instructions; remove and replace ceiling components that cannot be successfully cleaned and repaired.

3.6 CLEANING

- .1 Clean exposed surfaces of panels, including trim, edge mouldings, and suspension system members in accordance with manufacturer's instructions.

END OF SECTION

Part 1 General

1.1 SUMMARY

- .1 Section Includes:
 - .1 Non-load bearing channel stud framing.
 - .2 Runners.
 - .3 Metal channel stiffener.
 - .4 Sheet metal backing.
 - .5 Acoustical sealant.
 - .6 Insulating strip (sill gasket).
 - .7 Fasteners.
- .2 Related Requirements:
 - .1 Section 09 21 16 - Gypsum Board Assemblies.

1.3 ADMINSTRATIVE REQUIREMENTS

- .1 Convene pre-installation meetings one week prior to beginning work of this Section in accordance with Section 01 31 19 – Project Meetings to:
 - .1 Verify project requirements.
 - .2 Review installation conditions.
 - .3 Co-ordinate with other building subtrades.
 - .4 Review manufacturer's instructions.

1.4 ACTION SUBMITTALS / INFORMATIONALSUBMITTALS

- .1 Delegated Design:
 - .1 Professional engineers sealed and signed shop drawings and design submittals requiring structural engineering.
 - .2 Provide delegated design for the studs where heights or loads exceed manufacturers standard designs.
- .2 Evaluation Reports: Submit steel manufacturer evaluation reports certified under an independent third-party inspection program reviewed to the local building code.
- .3 Submit signed and sealed drawings stamped by a Professional Engineer registered in the Province of the work and as indicated in Section 01 35 00 – Delegated Design.
- .4 LEED Submittals: provide LEED submittals in accordance with Section 01 61 01 – LEED Product Requirements.

1.5 QUALITY ASSURANCE

- .1 Certificates: product certificates signed by manufacturer certifying materials comply with specified performance characteristics and criteria and physical requirements.
- .2 Test Reports: certified test reports showing compliance with specified performance characteristics and physical properties.
- .3 Retain a professional engineer, registered in the province of the Work, to design fabrication and erection of the Work of this Section in accordance with applicable Building Code and Contract Document requirements including, but not limited to, the following:

- .1 Submittals.
- .2 Site review and certification of installed components.
- .3 Completion of Letters or Commitment and Supervision specified in Section 01 35 00 – Delegated Design.
- .4 Verify stud thickness based on maximum deflections and loads from cladding on exterior walls.

1.6 DELIVERY, STORAGE, AND HANDLING

- .1 Packaging Waste Management
 - .1 Separate and recycle waste materials in accordance with Section 01 74 19 – Construction Waste Management.

Part 2 Products

2.1 PERFORMANCE REQUIREMENTS

- .1 System Design: Design and size components in accordance with CSA S136, to withstand dead loads, and live loads caused by wind loads acting normal to plane of wall as calculated in accordance with applicable code.
 - .1 Wind Loads: In accordance with Local Building Code with importance factors indicated on structural drawings.
- .2 Maximum deflections under specified wind loads shall conform to the following:
 - .1 Wall studs supporting masonry veneer shall meet the requirements of CSA S304, with veneer deflections limited to L/600 or with stud deflections limited to L/720.
 - .2 Wall studs supporting other finishes = L/360.
- .3 Design to provide for movement of components without damage, failure of joint seals, undue stress on fasteners, or other detrimental effects when subject to seasonal or cyclic day/night temperature ranges. Design wind bearing stud end connections to accommodate floor/roof deflections such that the studs are not loaded axially.
- .4 Conform to the requirements of specified fire rated and sound rated assemblies.
- .5 Provide bridging to prevent member rotation and member translation perpendicular to the minor axis. Provide for secondary stress effects due to torsion between lines of bridging. Do not rely on sheathing to resist torsion or minor axis buckling.
- .6 Design assembly to accommodate construction tolerances, deflection of building structural members, and clearances of intended openings.
- .7 Design door support assemblies to accommodate suspended loads, deflection of building structural members, and clearances of intended sliding door openings.
- .8 Connections between lightweight steel framing members shall be bolts, welding or sheet metal screws.
- .9 Resistances for sheet metal screws shall be based on the manufacturer's lower bound test values multiplied by the appropriate resistance factor given in CSA S136.

2.2 MATERIALS

- .1 Non-load bearing channel stud framing: to ASTM C645, stud sizes as indicated on Drawings, roll formed from 0.45 mm thickness hot dipped galvanized steel sheet complying with ASTM A653/A653M, Z120; or coating with equivalent corrosion resistance, for screw attachment of gypsum board. Use 0.75 mm heavy weight framing to support fire rated door frames. Knock-out service holes at 460 mm centres.
 - .1 Coating shall demonstrate equivalent corrosion resistance with an evaluation report acceptable to authorities having jurisdiction.
- .2 Runners: Width, gauge and galvanizing to match steel studs, and as follows:
 - .1 Double Runner Deflection Track: Outside runner using 50 mm flanges; inner runner 33 mm; maintaining 25 mm minimum deflection space.
 - .2 Deep Leg Deflection Track: Top runner having 50 mm down standing legs; maintaining 13 mm minimum deflection space.
 - .3 Slotted Deflection Track for Fire Separations: Premanufactured slotted top runner with 63 mm down standing legs and having 6 mm wide x 38 mm high slots spaced at 25 mm o/c along length of runner; tested and certified for use in fire rated wall construction:
 - .1 Acceptable Materials:
 - .1 Bailey Metal Products Ltd.
 - .2 SliptrackSystems, Brady Innovations LLC.
 - .3 BlazeFrame DSL Slotted Deflection Track, ClarkDietrich.
 - .2 Base Runner: Bottom track with 33 mm upstanding legs.
- .3 Metal channel stiffener: sizes as required, 1.4 mm thick cold rolled steel, coated with rust inhibitive coating.
- .4 Provide 20 gauge x 200 mm high sheet metal backing at all locations to support equipment, furniture, architectural woodwork, or casework.
- .5 Acoustical sealant: to Section 07 92 00 - Sealants.
- .6 Insulating strip (sill gasket): rubberized, moisture resistant 3 mm thick cork or foam strip, width to suit, with self sticking adhesive on one face, lengths as required.
- .7 Fasteners for Metal Framing: Type, material, size, corrosion resistance, holding power, and other properties required to fasten steel members to substrates.

Part 3 Execution

3.1 ERECTION

- .1 Align partition tracks at floor and ceiling and secure at 600 mm on centre maximum.
- .2 Install damp proof course under stud shoe tracks of partitions on slabs on grade.
- .3 Place studs vertically at 400 mm on centre and not more than 50 mm from abutting walls, and at each side of openings and corners. Position studs in tracks

at floor and ceiling. Cross brace steel studs as required to provide rigid installation to manufacturer's instructions.

- .4 Erect metal studding to tolerance of 1:1000.
- .5 Attach studs to bottom or ceiling track using screws, crimp method, or pop rivets.
- .6 Co-ordinate simultaneous erection of studs with installation of service lines. When erecting studs ensure web openings are aligned.
- .7 Co-ordinate erection of studs with installation of door/window frames and special supports or anchorage for work specified in other Sections.
- .8 Provide two studs extending from floor to ceiling at each side of openings wider than stud centres specified. Secure studs together, 50 mm apart using column clips or other approved means of fastening placed alongside frame anchor clips.
- .9 Install heavy gauge (1.52 mm thick) single jamb studs at openings if required.
- .10 Erect track at head of door/window openings and sills of sidelight/window openings to accommodate intermediate studs. Secure track to studs at each end, in accordance with manufacturer's instructions. Install intermediate studs above and below openings in same manner and spacing as wall studs.
- .11 Frame openings and around built-in equipment, cabinets, access panels, on four sides. Extend framing into reveals. Check clearances with equipment suppliers.
- .12 Provide 40 mm stud or furring channel secured between studs for attachment of fixtures behind lavatory basins, toilet and bathroom accessories, and other fixtures including grab bars and towel rails, attached to steel stud partitions.
- .13 Install steel studs or furring channel between studs for attaching electrical and other boxes.
- .14 Extend partitions to underside of roof except where noted otherwise on drawings.
- .15 Maintain clearance under beams and structural slabs to avoid transmission of structural loads to studs. Use 50 mm leg ceiling tracks. Use double track slip joint as indicated.
- .16 Install continuous insulating strips to isolate studs from uninsulated surfaces.
- .17 Install two continuous beads of acoustical sealant or continuous insulating strip under studs and tracks around perimeter of sound control partitions in accordance with ASTM C919.

3.2 CLEANING

- .1 Upon completion of installation, remove surplus materials, rubbish, tools and equipment barriers.

3.3 STEEL STUD HEIGHT SCHEDULE

- .1 Table below is a standard non-load bearing steel stud height table, provide delegated design as indicated in Section 01 35 00 – Delegated Design for anything not indicated below.

Maximum Stud Height (mm) based on lateral pressure of 240 Pa with deflection limit of L/240

Stud Spacing O.C.	300	400	600	300	400	600
Stud Depth (mm)	0.45 mm Steel Design Thickness			0.80 mm Steel Design Thickness		
64	3630	3430	3230	4240	3910	3530
92	4670	4370	4090	5440	5000	4500
102	5000	4670	4320	6070	5590	5000
152	6730	6020	5110	8150	7470	6580

Maximum Hard Board Stud Height (mm) based on lateral pressure of 240 Pa with deflection limit of L/240

Stud Spacing O.C.	305	406	610	305	406	610
Stud Depth (mm)	362S150-B18			600S150-B18		
5PSF						
L/120	7213	6553	5359	9779	8458	6908
L/240	5944	5385	4724	8407	7645	6680
L/360	5131	4674	4064	7290	6604	5766
10 PSF						
L/120	5359	4648	3785	6909	5994	4877
L/240	4724	4293	3734	6680	5994	4877
L/360	4064	3708	3150	5766	5258	4572

Based upon tests with 13 mm gypsum board both sides with screw fasteners spaced at 300 mm o.c. Heights also apply to greater gypsum board thickness and multiple gypsum board layers.

END OF SECTION

Part 1 General

1.1 SUMMARY

- .1 Section Includes:
 - .1 Wall tile.
 - .2 Grout.
 - .3 Membranes.
 - .4 Patching and levelling compound.
 - .5 Accessories including edge strips and tile sealer.
 - .6 Cleaning compounds.
- .2 Related Requirements:

1.3 ADMINISTRATIVE REQUIREMENTS

- .1 Preconstruction Meeting: Arrange a preconstruction meeting in accordance with Section 01 31 19 – Project Meetings attended by Contractor, Consultant, tile installer, tile supplier, and mortar and grout representative to discuss the following:
 - .1 Substrate and backing surfaces flatness requirements.
 - .2 Installation techniques associated with specified materials.
 - .3 Compatibility between specified materials and between adjacent materials.
 - .4 Concerns arising from site conditions.
 - .5 Concerns of installers or suppliers arising from as-constructed conditions.

1.4 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Submit product data in accordance with Section 01 33 00 – Submittal Procedures:
 - .1 Include manufacturer's information on:
 - .1 Ceramic tile, marked to show each type, size, and shape required.
 - .2 Chemical resistant mortar and grout (Epoxy and Furan).
 - .3 Cementitious backer unit.
 - .4 Dry-set cement mortar and grout.
 - .5 Divider strip.
 - .6 Elastomeric membrane and bond coat.
 - .7 Reinforcing tape.
 - .8 Levelling compound.
 - .9 Latex cement mortar and grout.

- .10 Commercial cement grout.
 - .11 Fasteners.
- .2 Submit shop drawings in accordance with Section 01 33 00 – Submittal Procedures:
 - .1 Indicate tile layout, patterns, colour arrangement, perimeter conditions, junctions with dissimilar materials, thresholds, and setting details.
 - .2 Locate and detail movement joints.
- .3 Submit samples in accordance with Section 01 33 00 – Submittal Procedures:
 - .1 Tile: Submit actual tile samples illustrating colour, texture, size and pattern for each type of tile specified.
 - .2 Grout: Submit manufacturer's full range of colours available for each type of grout specified.
 - .3 Trim shapes, bullnose cap and cove including bullnose cap and base pieces at internal and external corners of vertical surfaces, each type, colour, and size.
 - .4 Adhere tile samples to 11 mm thick plywood and grout joints to represent project installation.
- .4 LEED Submittals: provide LEED submittals in accordance with Section 01 61 01 – LEED Product Requirements.

1.5 MAINTENANCE MATERIAL SUBMITTALS

- .1 Extra Materials
 - .1 Provide maintenance materials in accordance with Section 01 78 00 - Closeout Submittals.
 - .2 Provide minimum 2% of each type and colour of tile required for project for maintenance use. Store where directed.
 - .3 Maintenance material same production run as installed material.

1.6 QUALITY ASSURANCE

- .1 Installer Qualifications: Specializing in tile work having minimum of five years successful documented experience with work comparable to that required for this project. Installer must be registered as a member in good standing with the Terrazzo, Tile and Marble Association of Canada.
- .2 Conform to requirements of Terrazzo, Tile and Marble Association of Canada (TTMAC) 2019-2021 Specification Guide 09 30 00 Tile Installation Manual.
- .3 Obtain each type of tile material required from single source. For colour consistency, ensure the supplier has capacity to provide products from the same production run, dye lot, calibre and batch number.
- .4 Obtain setting and grouting materials from one manufacturer to ensure compatibility.

1.7 DELIVERY, STORAGE, AND HANDLING

- .1 Deliver materials in containers with labels legible and intact and grade-seals unbroken.

- .2 Store materials to prevent damage or contamination.
- .3 Store materials in a dry area, protected from freezing, staining and damage.
- .4 Store cementitious materials on a dry surface.
- .5 Packaging Waste Management
 - .1 Separate and recycle waste materials in accordance with Section 01 74 19 – Construction Waste Management.

1.8 SITE CONDITIONS

- .1 Ambient Conditions:
 - .1 Maintain air temperature and structural base temperature at ceramic tile installation area above 12 degrees C for 48 hours before, during, and 48 hours after, installation. Tile and setting material stored at same conditions 48 hours before and seven days after application.
 - .2 Do not install tiles at temperatures less than 12 degrees C or above 38 degrees C.
 - .3 Do not apply epoxy mortar and grouts at temperatures below 15 degrees C or above 25 degrees C.

Part 2 Products

2.1 MATERIALS

- .1 Factory blend tile that exhibits colour variations within the ranges selected and package, therefore tile units taken from one package show the same range in colours as those taken from other packages.
- .2 Provide tile products manufactured in accordance with CAN/CGSB 75.1 or ANSI A108.1 as appropriate to the Basis-of-Design Materials.
 - .1 Provide Products used in exits having a flame spread rating of 25 or less when tested in accordance with ASTM E84 or ULC 102.2.

2.2 WALL TILE

- .1 Ceramic mosaic tile: to CAN/CGSB-75.1, and as follows:
 - .1 Type: 1
 - .2 Size: as indicated in Section 09 99 99 – Materials List
 - .3 Colour: as indicated in Section 09 99 99 – Materials List

2.3 MORTAR, GROUT, AND ADHESIVE MANUFACTURERS

- .1 Acceptable Manufacturers: Subject to compliance with requirements herein, provide products from one of the following manufacturers:
 - .1 Ardex Americas.
 - .2 Custom Building Products Ltd.
 - .3 Flextile Ltd.
 - .4 Laticrete International Inc.
 - .5 MAPEI Inc.

2.4 MORTAR AND ADHESIVE MATERIALS

- .1 Mortar to be of the following properties unless otherwise specified:
 - .1 Cement: Grey meeting requirements of CSA A3000.
 - .2 Sand: to ASTM C144, passing 16 mesh.
 - .3 Hydrated lime: to ASTM C207, Type N
 - .4 Latex additive: formulated for use in cement mortar and thin set bond coat.
 - .5 Water: potable and free of minerals and chemicals which are detrimental to mortar and grout mixes.
 - .6 Mortars and Adhesives:
 - .1 Maximum VOC limit 65 g/L to SCAQMD Rule 1168.
- .2 Thin Set Mortar: modified, non-sagging, dry-set lightweight cement mortar with polymer and complying with ANSI A118.4, A118.11 and ISO 13007 C2TES1P1.
 - .1 Acceptable Materials:
 - .1 ProLite Premium Blend LFT Mortar, Custom Building Products.
 - .2 66 FlexLite Mortar, Flextile Ltd.
 - .3 255 Multimax, Laticrete International Inc.
 - .4 Ultralite Mortar, MAPEI Inc.

2.5 GROUT

- .1 Colouring Pigments:
 - .1 Pure mineral pigments, limeproof and nonfading, complying with ASTM C979.
 - .2 Colouring pigments to be added to grout by manufacturer.
 - .3 Job coloured grout are not acceptable.
 - .4 Use in Commercial Cement Grout, Dry-Set Grout, and Latex Cement Grout.
- .2 Epoxy Grout: Multi-component, factory prepared, 100 percent epoxy resin and hardener with sand or mineral filler material; comply with ANSI A118.3 and ISO 13007 Classification R2/RG/ Classification RD for industrial grade.
 - .1 Colour: as indicated in Section 09 99 99 – Materials List
 - .2 Acceptable Materials:
 - .1 CEG-Lite, CEG-IG 100% Solid Commercial Epoxy Grout, Custom Building Products.
 - .2 FlexEpoxy 100 – 100% Solids 2-Component Epoxy Grout, Flextile Ltd.
 - .3 Latapoxy SpectraLOCK Pro Premium, Laticrete International Inc.
 - .4 SpectraLOCK 2000 IG, Laticrete International Inc.
 - .5 Kerapoxy CQ, Premium Epoxy Mortar and Grout, MAPEI Inc.

2.6 MEMBRANES

- .1 Waterproofing Membrane: Liquid rubber with fabric reinforcing.

- .1 Acceptable Materials:
 - .1 Custom 9240 Waterproofing and Crack Prevention Membrane, Custom Building Products.
 - .2 WP900 or WP980 WP/Crack Isolation Membrane, Flextile Ltd.
 - .3 9235 Waterproofing Membrane, Laticrete International Inc.
 - .4 Mapelastic AquaDefense, MAPEI Inc.

2.7 ACCESSORIES

- .1 Trim shapes (TS2):
 - .1 Conform to applicable requirements of adjoining wall tile.
 - .2 Use trim shapes sizes conforming to size of adjoining field wall tile, including existing spaces, unless specified otherwise.
 - .3 Internal and External Corners: provide trim shapes as follows where indicated.
 - .1 Material: brushed stainless steel
 - .2 Profile: Rounded reveal surface for edges and outside corners of tile surfaces.
 - .3 Basis of Design Materials:
 - .1 RONDEC, Schlüter
- .2 Sealant: in accordance with Section 07 92 00 - Sealants.
 - .1 Sealants: maximum VOC limit 250 g/L to SCAQMD Rule 1168.
- .3 Tile sealer and protective coating: to CAN/CGSB-25.20, Type one or two to tile and grout manufacturers recommendations.

2.8 CLEANING COMPOUNDS

- .1 Specifically designed for cleaning masonry and concrete and which will not prevent bond of subsequent tile setting materials including patching and leveling compounds and elastomeric waterproofing membrane and coat.
- .2 Materials containing acid or caustic material are not acceptable.

Part 3 Execution

3.1 EXAMINATION

- .1 Surfaces for tile installation must be clean, dimensionally stable, cured, level, plumb and free of contaminants such as oil, sealers and curing compounds.

3.2 PREPARATION

- .1 Protect surrounding work from damage or disfiguration arising from work of this Section.
- .2 Surfaces: Thoroughly clean substrate surfaces receiving tile finishes to remove grease, oil or dust films, and other contaminants affecting bond of materials within bonding systems and as follows:

- .1 Clean back of each tile before installation to remove surface contaminants and cutting residue, firing release dust and other debris detrimental to bond and final surface appearance.
- .3 Surface Levelling: apply self levelling compound to make backing surfaces flat and true to tolerances in plane listed in performance requirements above and as required by TTMAC.

3.3 INSTALLATION

- .1 Compliance: comply with manufacturer's written recommendations or specifications, including product technical bulletins, handling, storage and installation instructions, and datasheets.
- .2 Do tile work in accordance with TTMAC Tile Installation Manual except where specified otherwise.
- .3 Apply tile or backing coats to clean and sound surfaces.
- .4 Back Buttering: Obtain minimum 95% mortar coverage in accordance with applicable requirements for back buttering of tile in referenced TTMAC and ANSI A108 series of tile installation standards for the following applications:
 - .1 Tile having tiles 380 mm or larger in any direction.
 - .2 Tile installed with chemical resistant mortars and grouts.
 - .3 Tile having raised or textured backs.
 - .4 Tile having tile installation rated for Heavy or Extra Heavy Duty.
 - .5 All porcelain tiles with more than 20% of the tile backs covered with "white firing release" shall be "back buttered" so that 100% of the back is covered with adhesive mortar rated for C627, Extra Heavy Duty rating.
- .5 Fit tile around corners, fitments, fixtures, drains and other built-in objects. Maintain uniform joint appearance. Cut edges smooth and even. Do not split tiles.
- .6 Maximum surface tolerance 1:800.
- .7 Make joints between tile uniform, plumb, straight, true, even and flush with adjacent tile. Confirm joint width with Consultant. Ensure sheet layout not visible after installation. Align patterns.
- .8 Lay out tiles as indicated on drawings so perimeter tiles are minimum 1/2 size.
- .9 Sound tiles after setting and replace hollow-sounding units to obtain full bond.
- .10 Install divider strips at junction of dissimilar materials.
- .11 Allow minimum 24 hours after installation of tiles, before grouting.
- .12 Clean installed tile surfaces after installation and grouting cured.
- .13 Locate expansion, control, contraction, and isolation joints, as indicated in the TTMAC Installation manual to suit installation.

3.4 WATERPROOFING MEMBRANE INSTALLATION

- .1 Install waterproofing membrane in accordance with manufacturer's written instructions to produce membrane of uniform thickness bonded securely to substrate.

3.5 WALL TILE

- .1 Install tile on concrete walls to TTMAC details 302W.
- .2 Install tile on gypsum board to TTMAC details 305W.

3.6 TILE SEALER AND PROTECTIVE COATING

- .1 Apply manufacturer's recommended sealer in strict accordance with manufacturer's written instructions for the specific tile type being sealed.
- .2 Apply sealer to tiles before grouting in cases of absorbent biscuit tiles and again after completion and cleaning of grouting process.

3.7 FIELD QUALITY CONTROL

- .1 Manufacturer's Field Services:
 - .1 Provide manufacturer's field services consisting of product use recommendations and periodic site visits for inspection of product installation in accordance with manufacturer's instructions.

3.8 CLEANING

- .1 On completion of placement and grouting, clean all tile surfaces so they are free of foreign matter using Job Site Cleaner listed above:
 - .1 Remove grout residue from tile as soon as possible.
 - .2 Unglazed tile may be cleaned with acid solutions only when permitted by tile and grout manufacturer's written instructions, but no sooner than ten days after installation.
 - .3 Protect metal surfaces, cast iron, and vitreous plumbing fixtures from effects of acid cleaning.
 - .4 Flush surface with clean water before and after cleaning.

3.9 PROTECTION

- .1 Leave finished installation clean and free of cracked, chipped, broken, unbonded, or other tile deficiencies:
 - .1 Protect finished areas from traffic until setting materials have sufficiently cured in accordance with TTMAC requirements.
- .2 Provide protective covering until Substantial Performance of the Work.
- .3 Protect wall tiles and bases from impact, vibration, heavy hammering on adjacent and opposite walls for a minimum of 14 days after installation.

END OF SECTION

Part 1 General

1.1 SUMMARY

- .1 Section Includes:
 - .1 Non-Woven layered and formed Polyester felt fiber ceiling panels.
 - .2 Wire hangers, fasteners, main runners, cross tees, wall angle moldings and accessories.
- .2 Related Requirements:
 - .1 Section 09 21 16 – Gypsum Board Assemblies
 - .2 Section 09 51 13 – Acoustical Panel Ceilings
 - .3 Section 09 51 53 – Direct-Attached Acoustical Ceilings
 - .4 Section 09 22 00 – Non-Structural Metal Framing
 - .5 Section 09 99 99 – Materials List

1.2 REFERENCES

- .1 Reference Standards:
 - .1 American Society for Testing and Materials International (ASTM):
 - .1 ASTM C423-22, Standard Test Method for Sound Absorption and Sound Absorption Coefficients by the Reverberation Room Method.
 - .2 ASTM D3273-21, Standard Test Method for Resistance to Growth of Mold on the Surface of Interior Coatings in an Environmental Chamber.
 - .3 ASTM D3574-17, Standard Test Methods for Flexible Cellular Materials – Slab Bonded, and Molded Urethane Foams.
 - .4 ASTM E84-23d, Standard Test Method for Surface Burning Characteristics of Building Materials.
 - .5 ASTM F793/F793M-20, Standard Classification of Wall Covering by Use Characteristics.
 - .2 Canada Green Building Council (CaGBC):
 - .1 LEED Canada V4 – Building Design and Construction (BD+C).
 - .3 Underwriters Laboratories (UL):
 - .1 UL 181, Factory-Made Air Ducts and Connectors.
 - .4 Underwriters' Laboratories of Canada (ULC):
 - .1 ULC 102, Standard Method of Test for Surface Burning Characteristics of Building Materials and Assemblies. (ULC S102)

1.3 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Submit product data in accordance with Section 01 33 00 - Submittal Procedures:
 - .1 Product Data: Submit manufacturer's technical data for each type of panel and baffle including fire-resistive characteristics, finishes, details of installation, and the following:
 - .1 Manufacturer's installation instructions.

- .2 Certified test reports indicating compliance with Performance Requirements specified herein.
- .2 Submit shop drawings in accordance with Section 01 33 00 – Submittal Procedures:
 - .1 Layout of work.
 - .2 Sizes and details of components.
 - .3 Anchorage methods.
- .3 Submit samples in accordance with Section 01 33 00 - Submittal Procedures:
 - .1 Submit two full size samples of baffles to Consultant in specified colour selection for final approval prior to ordering.
- .4 LEED Submittals: provide LEED submittals in accordance with Section 01 61 01 – LEED Product Requirements.

1.4 CLOSEOUT SUBMITTALS

- .1 Closeout Submittals: Submit cleaning and maintenance instructions for incorporation into Operations and Maintenance Manual.

1.5 MAINTENANCE MATERIAL SUBMITTALS

- .1 Extra Materials
 - .1 Provide extra materials of acoustic units in accordance with Section 01 78 00 - Closeout Submittals.
 - .2 Provide baffles amounting to 5% of that installed in each pattern and type required for project.
 - .3 Ensure extra materials are from same production run as installed materials.
 - .4 Clearly identify each type of baffle, including colour and texture.
 - .5 Deliver to Consultant, upon completion of the work of this Section.

1.6 QUALITY ASSURANCE

- .1 Single Source Responsibility: Obtain baffles from a single manufacturer.
- .2 Installer: Use installers having a minimum of five years experience in successful application of acoustic baffles for projects of similar scope and complexity.
- .3 Mock-Ups:
 - .1 Construct mock-up 7 m² minimum of each type acoustical baffle including hangers.
 - .2 Verify spacing is adequate and as per design intent.
 - .3 Construct mock-up where directed.
 - .4 Allow 24 hours for inspection of mock-up by Consultant before proceeding with ceiling work.
 - .5 When accepted, mock-up will demonstrate minimum standard for this work. Mock-up may remain as part of the finished work.

1.7 DELIVERY, STORAGE, AND HANDLING

- .1 Deliver, store and handle materials in accordance with manufacturer's instructions.
- .2 Deliver and store materials in manufacturer's original unopened containers with brands, names, and production lot numbers clearly marked on these containers.
- .3 Store products in a cool, dry place out of direct sunlight.
- .4 Protect from elements and from damage.
- .5 Packaging Waste Management
 - .1 Separate and recycle waste materials in accordance with Section 01 74 19 – Construction Waste Management.

1.8 WARRANTY

- .1 Provide manufacturer's standard warranty in name of owner and include in Operations and Maintenance Manuals.

Part 2 Products

2.1 MANUFACTURERS

- .1 Basis-of-Design Materials:
 - .1 As indicated in Section 09 99 99 – Materials List.

2.2 MATERIALS

- .1 Baffles (C3): Prefabricated, sound absorptive, suspended ceiling blades.
 - .1 Material: Non-woven layered and formed Polyester felt (PET) fibre.
 - .2 Panel Size and Thickness: as indicated in Section 09 99 99 – Materials List.
 - .3 Colour: as indicated in Section 09 99 99 – Materials List.
 - .4 Edge Profile: Square.
 - .5 Fire Resistance: Class A in accordance with ASTM E84 and as follows:
 - .1 Flame Spread: 25 or less.
 - .2 Smoke Developed: 450 or less.
- .2 Suspension System: Manufacturer's recommended suspension system including connectors, cables and blade hanging assemblies.
 - .1 Basis-of-Design Materials:
 - .1 Aluminum Suspension System, Armstrong World Industries, Inc.

2.3 ACCESSORIES

- .1 1.6 mm steel cable to suit application as recommended by manufacturer.

Part 3 Execution

3.1 EXAMINATION

- .1 Verification of Conditions: Examine areas and conditions under which work is to be performed and identify conditions detrimental to proper and or timely completion.
- .2 Do not proceed until unsatisfactory conditions have been corrected.

3.2 INSTALLATION

- .1 Install in accordance with manufacturer's written instructions and recommendations.
- .2 Acoustical Baffles: Do not fasten anchors of any type to steel deck without written approval from structural engineer of record.
 - .1 Install mounting cable by attaching to bottom chord of trusses or joists.
 - .2 Attach bottom end of cable directly to baffle's integral web strapping or grommets directly or with "S" type hooks.
 - .3 Install baffle in configuration and elevations indicated, true to lines and plane indicated.
 - .4 Do not install baffles more than 3000 mm below ceiling or roof structure from which it is hanging. This may cause excessive swaying of baffles by air movement.

3.3 NON-CONFORMING WORK

- .1 Remove damaged or discoloured material, or material that cannot be properly cleaned, and install new material.

3.4 CLEANING

- .1 Clean adjacent surfaces and remove unused product and debris from site.
- .2 Clean soiled surfaces of materials after installation is complete.
- .3 Remove and reinstall improperly installed material.

END OF SECTION

Part 1 General

1.1 SUMMARY

.1 Section Includes:

- .1 Acoustic panels.
- .2 Acoustical suspension system.
- .3 Accessories including sealants and expansion joints.

.2 Related Requirements:

- .1 Section 09 21 16 – Gypsum Board Assemblies
- .2 Section 09 51 53 – Direct-Attached Acoustical Ceilings
- .3 Section 09 99 99 – Materials List.
- .4 Division 23 – HVAC
- .5 Division 26 – Electrical

1.2 REFERENCES

- .6 Underwriter's Laboratories of Canada (ULC):
 - .1 ULC 102, Standard Method of Test for Surface Burning Characteristics of Building Materials and Assemblies (ULC S102).

1.3 ADMINISTRATIVE REQUIREMENTS.

- .1 Coordination of Work: Coordinate acoustical ceiling work with installers of related work including, but not limited to building insulation, gypsum board, light fixtures, mechanical systems, electrical systems, and sprinklers.

1.4 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Submit product data in accordance with Section 01 33 00 – Submittal Procedures.
 - .1 Submit manufacturer's printed product literature, specifications and data sheet for each product specified.
- .2 Submit shop drawings in accordance with Section 01 33 00 – Submittal Procedures.
 - .1 Coordination Drawings: Reflected ceiling plans drawn to scale and coordinating penetrations and ceiling mounted items indicating the following:
 - .1 Ceiling suspension system members.
 - .2 Method of attaching suspension system hangers to building structure.
 - .3 Ceiling mounted items including light fixtures; air outlets and inlets; speakers; sprinklers; and special mouldings at walls, column penetrations, and other junctures of acoustic ceilings with adjoining construction.
- .3 Submit samples in accordance with Section 01 33 00 – Submittal Procedures.
 - .1 Submit duplicate full size samples of each type of acoustical unit.
 - .2 Include accessories and mitered interior and exterior corners of wall mouldings.
- .4 Submit Workplace Hazardous Materials Information System WHMIS SDS - Safety Data Sheets acceptable to Labour Canada and Health and Welfare Canada.
- .5 LEED Submittals: provide LEED submittals in accordance with Section 01 61 01 – LEED Product Requirements.

1.5 MAINTENANCE MATERIAL SUBMITTALS

- .1 Extra Materials
 - .1 Provide extra materials of acoustic units in accordance with Section 01 78 00 - Closeout Submittals.
 - .2 Provide acoustical units amounting to 5% of gross ceiling area for each pattern and type required for project.
 - .3 Ensure extra materials are from same production run as installed materials.
 - .4 Clearly identify each type of acoustic unit, including colour and texture.
 - .5 Deliver to Consultant, upon completion of the work of this Section.

1.6 QUALITY ASSURANCE

- .1 Regulatory Requirements:
 - .1 Fire-resistance rated floor/ceiling and roof/ceiling assembly: certified by Canadian Certification Organization accredited by Standards Council of Canada.
- .2 Single-Source Responsibility: Provide perimeter trim components, panels and grid components by a single manufacturer.
- .3 Ensure seismic restraint work including anchoring devices are designed and certified by a Professional Engineer registered in BC, who shall carry out periodic site reviews of the work of this Section during construction and at completion, and submit reports and Letters of Assurance in the Forms established by BC Building Code.
- .4 Mock-Ups:
 - .1 Construct mock-ups in accordance with Section 01 45 00 - Quality Control.
 - .2 Construct mock-up 10 m² minimum of each type of acoustical panel ceiling including one inside corner and one outside corner.
 - .3 Construct mock-up where directed.
 - .4 Allow 24 hours for inspection of mock-up by Consultant before proceeding with ceiling work.
 - .5 When accepted, mock-up will demonstrate minimum standard for this work. Reviewed mock-up may remain as part of the finished work.

1.7 DELIVERY, STORAGE, AND HANDLING

- .1 Deliver, store and handle materials in accordance with Section 01 61 01 - LEED Product Requirements and as follows:
 - .1 Protect on site stored or installed absorptive material from moisture damage.
 - .2 Store extra materials required for maintenance, where directed by Consultant.
- .2 Packaging Waste Management

- .1 Separate and recycle waste materials in accordance with Section 01 74 19 – Construction Waste Management.

1.8 SITE CONDITIONS

- .1 Permit wet work to dry before beginning to install.
- .2 Maintain uniform minimum temperature of 15 degrees C and humidity of 20-40% before and during installation.
- .3 Store materials in work area 48 hours prior to installation.

1.9 WARRANTY

- .1 Provide manufacturers 30 year ceiling system warranty for failures including:
 - .1 Sagging and warping on panels.
 - .2 Growth of mould and mildew on panels.
 - .3 Rusting and manufacturers defects on grid system.

Part 2 Products

2.1 MANUFACTURERS

- .1 Acceptable Manufacturers: Subject to compliance with requirements specified in this Section and as established by the Basis-of-Design Materials, manufacturers offering products that may be incorporated into the Work include; but are not limited to, the following:
 - .1 Acoustic Panels:
 - .1 Armstrong World Industries Canada Ltd.
 - .2 CertainTeed.
 - .3 CGC Interiors, A USG Company.
 - .4 Rockfon.
 - .2 Suspension Systems:
 - .1 Armstrong World Industries Canada Ltd.
 - .2 CertainTeed.
 - .3 CGC Interiors, A USG Company.
 - .4 Chicago Metallic / Rockfon.

2.2 PERFORMANCE/DESIGN CRITERIA

- .1 Maximum deflection: 1/360th of span to ASTM C635/C635M deflection test.

2.3 MATERIALS

- .1 Acoustic Panels (C4): conforming to ASTM E1264 as indicated in Section 09 99 99 – Materials List.
 - .1 Flame Spread: Class A.

2.4 ACOUSTICAL SUSPENSION SYSTEM

- .1 Intermediate duty system to ASTM C635/C635M.
- .2 Basic materials for suspension system: commercial quality cold rolled steel.
- .3 Suspension system: non fire rated, exposed tee bar grid width as appropriate for materials specified.
- .4 Acceptable Materials: materials to match products specified, use only materials from same manufacturers of panel products and as follows:
 - .1 Prelude XL 15/16" Exposed Tee, Armstrong.
 - .2 15/16" Classic, CertainTeed.
 - .3 DX/DXL, CGC, A USG Company.
 - .4 Chicago Metallic 1200, Rockfon.
- .5 Exposed tee bar grid components: shop painted satin sheen, white colour. Components die cut. Main tee with double web, rectangular bulb and 25 mm rolled cap on exposed face. Cross tee with rectangular bulb; web extended to form positive interlock with main tee webs; lower flange extended and offset to provide flush intersection.
- .6 Hanger wire: galvanized soft annealed steel wire:
 - .1 3.6 mm diameter for access tile ceilings.
 - .2 To ULC design requirements for fire rated assemblies.
 - .3 To suit seismic requirements and ceiling flatness requirements.
 - .4 2.78 mm diameter for other ceilings.
- .7 Hanger inserts: purpose made.
- .8 Accessories: splices, clips, wire ties, retainers and wall moulding flush, to complement suspension system components, as recommended by system manufacturer.
- .9 Edge Mouldings and Trim: Sheet metal edge mouldings and trim selected from manufacturer's standard mouldings for edges and penetrations that fit specified acoustic panel edge and suspension system, and as follows:
 - .1 Provide stepped edge moulding that forms reveal of same depth and width as that formed between edge of panel and flange at exposed suspension member for lay in panels with tegular edged materials.
 - .2 Provide edge mouldings fabricated to diameter required to fit circular penetrations exactly.
 - .3 Provide edge mouldings and trims that match width and configuration of exposed runners including the following configurations:
 - .1 Sheet Metal Fillers: Light zinc coated sheet steel finished to match T-bar.
 - .2 Wall Mould: Channel or angle shape with a 25 mm or 22 mm exposed face.

.10 System Accessories:

- .1 Sealant: Acrylic type as specified in Section 07 92 00 - Sealants for use in exposed locations, colour to match ceiling grid.
- .2 Expansion Joint: 50% movement santoprene with mill finish aluminum base, colour from manufacturers standard range, confirm colour with Consultant.
 - .1 Basis-of-Design Material:
 - .1 ACWW-3, Balco.

Part 3 Execution

3.1 EXAMINATION

- .1 Do not install acoustical panels and tiles until work above ceiling has been reviewed by Consultant.

3.2 PREPARATION

- .1 Store materials in work area 48 hours prior to installation.

3.3 INSTALLATION OF SUSPENSION SYSTEM

- .1 Compliance: comply with manufacturer's written recommendations or specifications, including product technical bulletins, handling, storage and installation instructions, and datasheets.
- .2 Installation: in accordance with ASTM C636/C636M except where specified otherwise.
- .3 Install suspension system to manufacturer's instructions and Certification Organizations tested design requirements.
- .4 Conform to building code for seismic restraints of ceiling grid and as follows:
 - .1 Minimum 50 mm wall molding.
 - .2 Attach suspension system to two adjacent walls, opposite walls must have a 19 mm clearance.
 - .3 Use heavy duty suspension system.
 - .4 Ceiling areas over 93 m2 must have horizontal restraint wire or rigid bracing.
 - .5 Ceiling areas over 232 m2 must have seismic separation joints or full height partitions.
 - .6 Ceilings without rigid bracing must have 50 mm oversized trim rings for sprinklers and other penetrations.
 - .7 Changes in ceiling plane must have positive bracing.
 - .8 Cable trays and electrical conduits must be independently supported and braced.
 - .9 Suspended ceilings are subject to special inspection.
 - .10 Provide perimeter support wires within 200 mm.

- .5 Do not erect ceiling suspension system until all mechanical and electrical work above ceiling has been inspected by Consultant.
- .6 Secure hangers to overhead structure using attachment methods acceptable to Consultant.
- .7 Install hangers spaced at maximum 1200 mm centres and within 150 mm from ends of main tees.
- .8 Lay out system according to reflected ceiling plan.
- .9 Ensure suspension system is co-ordinated with location of related components.
- .10 Install wall moulding to provide correct ceiling height.
- .11 Completed suspension system to support super-imposed loads, such as lighting fixtures, diffusers grilles and speakers.
- .12 Support at light fixtures and diffusers with additional ceiling suspension hangers within 150 mm of each corner and at maximum 600 mm around perimeter of fixture.
- .13 Interlock cross member to main runner to provide rigid assembly.
- .14 Finished ceiling system to be square with adjoining walls and level within 1:1000.
- .15 Expansion joints:
 - .1 Erect two main runners parallel, 25 mm apart, on building expansion joint line. Lay in strip of acoustic tile/board, painted colour as directed, 25% narrower than space between 2 'T' bars.
 - .2 Supply and install "Z" shaped metal trim pieces at each side of expansion joint. Design to accommodate plus or minus 25 mm movement and maintain visual closure. Finish metal components to match adjacent exposed metal trim. Provide backing plates behind butt joints.

3.4 INSTALLATION OF ACOUSTIC PANELS

- .1 Install acoustic panels and tiles in ceiling suspension system.

3.5 APPLICATION

- .1 Refer to reflected ceiling plan.
- .2 Scribe acoustic units to fit adjacent work. Butt joints tight, terminate edges with moulding.
- .3 Paint cut panel edges remaining exposed after installation; match colour of exposed panel surfaces using coating recommended in writing for this purpose by acoustical panel manufacturer.

3.6 SYSTEM INTEGRATION

- .1 Co-ordinate ceiling work to accommodate components of other Sections, such as light fixtures, diffusers, speakers, sprinkler heads, to be built into acoustical ceiling components.

END OF SECTION

Part 1 General

1.1 SUMMARY

- .1 Section Includes:
 - .1 Non-Woven layered and formed Polyester felt fiber ceiling and wall panels.
 - .2 Wire hangers, fasteners, main runners, cross tees, and accessories.
- .2 Related Requirements:
 - .1 Section 09 21 16 – Gypsum Board Assemblies
 - .2 Section 09 22 00 – Non-Structural Metal Framing
 - .3 Section 09 48 33 – Acoustic Baffles
 - .4 Section 09 51 13 – Acoustical Panel Ceilings
 - .5 Section 09 99 99 – Materials List
 - .6 Division 23 Mechanical: HVAC
 - .7 Division 26 Electrical: Lighting

1.2 REFERENCES

 - .1 ULC 102, Standard Method of Test for Surface Burning Characteristics of Building Materials and Assemblies. (ULC S102)

1.3 ADMINISTRATIVE REQUIREMENTS

- .1 Coordination of Work: Coordinate Work of this Section with installers of related work including, but not limited to building insulation, gypsum board, light fixtures, mechanical systems, electrical systems, and sprinklers.

1.4 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Submit product data in accordance with Section 01 33 00 – Submittal Procedures.
 - .1 Submit manufacturer's printed product literature, specifications and data sheet for each product specified.
 - .2 Certifications: submit manufacturer's certifications that products comply with specified requirements, including laboratory reports showing compliance with specified tests and standards. For acoustical performance, products must be tested to the A, D-20, C-20, or C-40 method.
- .2 Submit samples in accordance with Section 01 33 00 – Submittal Procedures.
 - .1 Submit minimum 152 mm x 152 mm samples of direct-attached acoustical ceiling panels.
- .3 Submit shop drawings in accordance with Section 01 33 00 – Submittal Procedures.
 - .1 Submit layout and details of direct-attached ceiling panels showing locations of items that are to be coordinated with the installation.
- .4 LEED Submittals: provide LEED submittals in accordance with Section 01 61 01 – LEED Product Requirements.

1.5 EXTRA MATERIALS SUBMITTALS

- .1 Provide extra materials of acoustic units in accordance with Section 01 78 00 – Closeout Submittals.
- .2 Extra Materials: Furnish extra materials described below that match products installed. Packaged with protective covering for storage and identified with appropriate labels.

- .1 Direct-Attached Ceiling Panels: Furnish quality of full-size units equal to five percent of amount installed.

- .3 Deliver to Consultant, upon completion of the work of this Section.

1.6 QUALITY ASSURANCE

- .1 Single-Source Responsibility: Provide acoustical panel units and grid components by a single manufacturer.
- .2 Fire Performance Characteristics: Identify acoustical ceiling components with appropriate markings of applicable testing and inspecting organization.
 - .1 Surface Burning Characteristics: tested in accordance with ASTM E84 and complying with ASTM E1264 Classification.

1.7 DELIVERY, STORAGE, AND HANDLING

- .1 Deliver, store and handle materials in accordance with Section 01 61 01 – LEED Product Requirements.
- .2 Deliver acoustical ceiling units to project site in original, unopened packages and store them in a fully enclosed space where they will be protected against damage from moisture, direct sunlight, surface contamination, and other causes.
- .3 Provide labels indicating brand name, style, size and thickness.
- .4 Before installing acoustical ceiling units, permit them to reach room temperature and a stabilized moisture content.
- .5 Handle acoustical ceiling units carefully to avoid chipping edges or damaged units in any way.
- .6 Packaging Waste Management
 - .1 Separate and recycle waste materials in accordance with Section 01 74 19 – Construction Waste Management.

1.8 SITE CONDITIONS

- .1 Do not install ceiling panels until building is closed in and HVAC system is operational.
- .2 Locate materials onsite at least 24 hours before beginning installation to allow materials to reach temperature and moisture content equilibrium.
- .3 Ambient Conditions: Maintain the following conditions in areas where acoustical materials are to be installed 24 hours before, during and after installation:
 - .1 Relative Humidity: 65 - 75%.
 - .2 Uniform Temperature: 13 - 21 degrees C.

1.9 WARRANTY

- .1 Submit a written warranty executed by the manufacturer, agreeing to repair or replace panels that fail within the warranty period. Failures include, but are not limited to the following:
 - .1 Sagging and warping.

- .2 Direct-attached ceiling panels one source manufacturer is thirty years from date of Substantial Performance.

Part 2 Products

2.1 PERFORMANCE/DESIGN CRITERIA

- .1 Maximum deflection: 1/360th of span to ASTM C635/C635M deflection test.

2.2 MATERIALS

- .1 Direct-Attached Acoustic Panels (C1):
 - .1 Material: Non-woven layered and formed Polyester felt (PET) fibre.
 - .2 NRC: 0.85
 - .3 Size: as indicated on Drawings.
 - .4 Edge Profile: Bevelled.
 - .5 Fire Resistance: Class A in accordance with ASTM E84 and as follows:
 - .1 Flame Spread: 25 or less.
 - .2 Smoke Developed: 450 or less.
 - .6 Basis-of-Design Materials:
 - .1 As indicated in Section 09 99 99 – Materials List.

2.3 ACCESSORIES

- .1 Main beams and cross tees: commercial quality hot-dipped galvanized steel.
- .2 Main Beams: manufactured main beam 38 mm knurled face with reverse hem by 43 mm high by 3658 mm long with factory punched cross tee routs and hanger wire holes and main beam clip. Heavy-duty performance per ASTM C635/C635M.
- .3 Cross Tee: manufactured cross tee 38 mm knurled face with reverse hem by 38 mm high by length to suit with factory punched cross tee routs and hanger wire holes and XL stake on clip.

Part 3 Execution

3.1 EXAMINATION

- .1 Do not proceed with installation until all wet work such as concrete, plastering and painting has been completed and thoroughly dried out, unless expressly permitted by manufacturer's printed recommendations.

3.2 PREPARATION

- .1 Locate materials onsite at least 24 hours before beginning installation to allow materials to reach temperature and moisture content equilibrium.
- .2 Measure each ceiling area and establish layout of units. Coordinate panel layout with mechanical and electrical fixtures.

- .3 Coordination: Furnish layouts for preset inserts, clips, and other ceiling anchors whose installation is specified in other Sections.
- .4 Furnish concrete inserts and similar devices to other trades for installation well in advance of time needed for coordination of other work.

3.3 INSTALLATION

- .1 Install direct-attached ceiling panels in accordance with manufacturer's installation instructions.
- .2 Replace damaged and broken units.

3.4 CLEANING

- .1 Clean exposed surfaces of acoustical ceilings, including trim, edge moldings, and suspension members. Comply with manufacturer's instructions for cleaning and touch up of minor finish damage. Remove any units that cannot be successfully cleaned and or repaired. Replace with attic stock or new product to eliminate evidence of damage.

END OF SECTION

Part 1 General

1.1 SUMMARY

.1 Section Includes:

- .1 Vinyl composition tile.
- .2 Resilient base.
- .3 Accessories:
 - .1 Metal edge strips.
 - .2 Sub-floor filler and leveller.
 - .3 Primers and adhesives.
 - .4 Sealer and wax.

.2 Related Requirements:

- .1 Section 03 35 00 – Concrete Finishing
- .2 Section 06 10 00 – Rough Carpentry
- .3 Section 07 92 00 – Sealants
- .4 Section 09 99 99 – Materials List

1.2 REFERENCES

.1 Reference Standards:

1.3 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Provide product data in accordance with Section 01 33 00 - Submittal Procedures.
 - .1 Submit one copy of product data for each type of product specified.
 - .2 Submit Workplace Hazardous Materials Information System WHMIS SDS - Safety Data Sheets for flooring adhesive and seam welding. Indicate VOC content.
 - .3 Provide seaming diagram prior to laying flooring.
- .2 Provide samples in accordance with Section 01 33 00 - Submittal Procedures.
 - .1 Submit duplicate 300 x 300 mm sample pieces of sheet material, 300 mm long base.
- .3 LEED Submittals: provide LEED submittals in accordance with Section 01 61 01 – LEED Product Requirements.

1.4 CLOSEOUT SUBMITTALS

- .1 Provide manufacturer's printed recommendations for general maintenance, including cleaning instructions and guidelines for use of waxes and other protective coatings and appearance enhancers in accordance with Section 01 78 00 – Closeout Submittals.

1.5 MAINTENANCE MATERIAL SUBMITTALS

- .1 Extra Materials
 - .1 Provide extra materials of resilient sheet flooring and adhesives in accordance with Section 01 78 00 - Closeout Submittals.
 - .2 Provide 5 % of each colour, pattern and type flooring material required for project for maintenance use.
 - .3 Extra materials from same production run as installed materials.
 - .4 Clearly identify each roll of sheet flooring and each container of adhesive.
 - .5 Deliver to Owner upon completion of the work of this Section.
 - .6 Store where directed by Consultant.

1.6 QUALITY ASSURANCE

- .1 Regulatory Requirements: Provide products that meet requirements of ULC 102.2 as applicable for required flame spread ratings; labelled and listed by Underwriters Laboratories of Canada (ULC), or another testing and inspecting agency acceptable to authorities having jurisdiction.
- .2 Provide preparation, materials and workmanship in strict accordance with NFCA requirements as detailed in the latest (online) edition of the NFCA Floor Covering Reference Manual of Canada, (www.floorcoveringreferencemanual.com) and the

material manufacturer's written recommendations for conditions of work and guarantee periods stated.

- .3 Qualifications: Provide proof of qualifications when requested by Consultant:
 - .1 Installer shall be Trade Qualified for their specific flooring products by the National Floor Covering Association.
 - .2 Resilient Flooring Installer: Use an installer who is competent in heat welding and have a minimum of five years documented experience in the installation of resilient sheet flooring and seams in accordance with manufacturer's training or certification program:
 - .3 Source Limitations: Obtain each type, colour, and pattern of flooring or accessories specified from one source with resources to provide products of consistent quality in appearance and physical properties without delaying the Work.
- .4 Mock-Up:
 - .1 Construct mock-ups as directed by Consultant to verify selections made under sample Submittals and to demonstrate aesthetic effects, patterns, and qualities of materials, and execution before installing flooring materials and accessories in accordance with requirements in Section 01 45 00 – Quality Control.
 - .2 Install in a representative room designated by the Consultant, a sample flooring installation of at least 10 m² in area showing pattern as directed by Consultant, colour matching, and longitudinal and transverse joints for the Consultants' review and acceptance.
 - .3 The mock-up room shall represent the minimum acceptable standard for the Work when identified modifications to the mock-up are completed, reviewed, and accepted by the Consultant.
 - .4 Accepted mock-up room installation can remain as part of the Work.

1.7 NFCA QUALITY ASSURANCE PROGRAM

- .1 All Work described in this Section is included under the Quality Assurance Program (QAP) of NFCA (National Floor Covering Association), as detailed in the latest (online) edition of the Floor Covering Reference Manual of Canada (www.floorcoveringreferencemanual.com) and will be reviewed in accordance with QAP requirements therein by a third party Inspection Agency assigned by the Accredited Quality Assurance (AQA) Provider. Include the cost of this program in the Contract Price.
- .2 Replace preparation, materials, and workmanship that do not meet NFCA requirements in accordance with Quality Assurance requirements without any additional cost to the Owner.
- .3 Provide a two-year NFCA Maintenance Bond.
- .4 Request a QA Review Form (Part A04A) from NFCA and submit prior to ordering materials.
- .5 Meet the requirements detailed in PART A05 Trade Qualifications in the latest edition of the NFCA Floor covering Reference Manual.

- .6 Installer Qualifications: be a member in good standing of the National Floor Covering Association (NFCA) and referenced on the NFCA website (www.nfca.ca).

1.8 DELIVERY, STORAGE, AND HANDLING

- .1 Deliver, store and handle materials in accordance with Section 01 61 00 - Common Product Requirements.
- .2 Deliver materials in good conditions to the jobsite in the manufacturer's original unopened containers that bear the name and brand of the manufacturer, project identification, and shipping and handling instructions.
- .3 Store materials in a clean, dry, enclosed space off the ground, and protect from the weather and from extremes of heat and cold. Protect adhesive from freezing. Store flooring, adhesives and accessories in the spaces where they will be installed for at least 48 hours before beginning installation.
- .4 Packaging Waste Management
 - .1 Separate and recycle waste materials in accordance with Section 01 74 19 – Construction Waste Management.

1.9 SITE CONDITIONS

- .1 Ambient Conditions: Maintain air temperature and structural base temperature at flooring installation area above 20 degrees for 48 hours before, during and 48 hours after installation.

1.10 WARRANTY

- .1 Provide Manufacturer's Warranty for product to be free from manufacturer's defects for a period of five years from date of substantial performance.
- .2 Provide a two-year NFCA Maintenance Bond as indicated above.

Part 2 Products

2.1 MATERIALS

- .1 Basis-of-Design Materials: Materials and colours listed below form the Basis-of-Design materials for this project.
- .2 Materials other than named products Basis-of-Design materials may be acceptable to the Consultant; submit information in accordance with Section 01 62 00 – Product Options and Substitutions no later than seven days prior to bid closing date and as follows:
 - .1 Proposed alternates shall match colour range, texture and performance characteristics of named products, and shall not require a change to colour board for Project.
 - .2 Proposed alternates found acceptable by Consultant will be listed in an Addendum.
 - .3 The Consultant is not obliged to accept any materials presented for their review and does not need to provide reasons for rejection of proposed alternates.

2.2 TILE FLOORING

- .1 Vinyl composition tile (VCT1, VCT2): to ASTM F1066, and as follows:
 - .1 Class: One – solid colour tile
 - .2 Pattern: plain.
 - .3 Wearing surface: smooth
 - .4 Thickness: 3.17 mm.
 - .5 Size: as indicated.
 - .6 Colour: as indicated in Section 09 99 99 – Materials List

2.3 RESILIENT BASE

- .1 Resilient Base (RB1): to ASTM F1861, and as indicated in Section 09 99 99 – Materials List.
 - .1 Type: TP – rubber, thermoplastic
 - .2 Group: One – solid
 - .3 Style: B – Cove
 - .4 Thickness: 3.17 mm.
 - .5 Height: 101 mm.
 - .6 Length: 36.5 meter rolls.
 - .7 End Stops and External Corners: premoulded.
 - .8 Colour: as indicated in Section 09 99 99 – Materials List

2.4 ACCESSORIES

- .1 Metal edge strips (TS1):
 - .1 Extruded, smooth, mill finish stainless steel with lip to extend under floor finish, shoulder flush with top of adjacent floor finish.
 - .2 Finish and Profile: as indicated in Section 09 99 99 – Materials List.
- .2 Sub-floor filler and leveller: white premix latex requiring water only to produce cementitious paste or Two part latex-type filler requiring no water as recommended by flooring manufacturer for use with their product.
- .3 Primers and adhesives: of types recommended by resilient flooring manufacturer for specific material on applicable substrate, above, on or below grade.
 - .1 VCT adhesives:
 - .1 SBR Emulsion polymer, wet-lay moisture resistant adhesive with maximum VOC limit 50 g/L to SCAQMD Rule 1168.
 - .2 Basis-of-Design Materials:
 - .1 Ultrabond ECO 711, MAPEI Inc.
 - .2 Resilient base adhesives:
 - .1 Acrylic polymer, vertical surface impact resistant adhesive with maximum VOC limit 50 g/L to SCAQMD Rule 1168.
 - .2 Basis-of-Design Materials:
 - .1 Ultrabond ECO 575, MAPEI Inc.

- .4 Sealer and wax: type recommended by resilient flooring material manufacturer for material type and location that does not affect the warranty or the slip resistance.
 - .1 Sealer: maximum VOC limit 100 g/L to SCAQMD Rule 1113.

Part 3 Execution

3.1 EXAMINATION

- .1 Install flooring and accessories after the other finishing operations, including painting, have been completed. Close spaces to traffic during the installation of the flooring. Do not install flooring over concrete slabs until they are sufficiently dry to achieve a bond with the adhesive, in accordance with the manufacturer's recommended bond and moisture tests.
- .2 Verify that surfaces are flat to tolerances acceptable to flooring manufacturer, free of cracks that might telegraph through flooring, clean, dry, and free of curing compounds, surface hardeners, and other chemicals that might interfere with bonding of flooring substrate.
- .3 Ensure concrete floors have maximum 2.5% moisture content, exhibit normal alkalinity and no carbonization or dusting.
- .4 Ensure concrete floors are clean, smooth, and flat to plus or minus 3 mm over 3 meters.

3.2 PREPARATION

- .1 Remove existing resilient flooring.
- .2 Remove or treat old adhesives to prevent residual, old flooring adhesives from bleeding through to new flooring and/or interfering with the bonding of new adhesives.
- .3 Clean floor and apply filler; trowel and float to leave smooth, flat hard surface. Prohibit traffic until filler cured and dry.
- .4 Remove sub-floor ridges and bumps. Fill low spots, cracks, joints, holes and other defects with sub-floor filler.
- .5 Prohibit traffic until filler is cured
- .6 Clean substrates of contaminants.
- .7 Alkalinity and Adhesion Testing: perform tests recommended by manufacturer. Proceed with installation after substrates pass testing.
- .8 Moisture Testing: perform tests recommended by manufacturer and as follows:
 - .1 Perform anhydrous calcium chloride test ASTM F1869. Proceed with installation only after substrates have maximum moisture-vapour-emission rate of 3 lb of water/1000 sq. ft in 24 hours.
 - .2 Perform relative humidity test using in situ probes, ASTM F2170. Proceed with installation only after substrates have maximum 75 percent relative humidity level measurement.
 - .3 Proceed with installation after substrates pass testing.

- .9 Prime or seal concrete slab or plywood sub-floor to resilient flooring manufacturer's printed instructions.

3.3 INSTALLATION: GENERAL

- .1 Compliance: comply with manufacturer's written recommendations or specifications, including product technical bulletins, handling, storage and installation instructions, and datasheets.
- .2 Provide high ventilation rate, with maximum outside air, during installation, and for 48 to 72 hours after installation. If possible, vent directly to outside. Do not let contaminated air recirculate through district or whole building air distribution system. Maintain extra ventilation for at least one month following building occupation.
- .3 Apply adhesive uniformly using recommended trowel in accordance with flooring manufacturer's instructions. Do not spread more adhesive than can be covered by flooring before initial set takes place.
- .4 Cut flooring around fixed objects.
- .5 Install feature strips and floor markings where indicated. Fit joints tightly.
- .6 Install flooring in pan type floor access covers. Maintain floor pattern.
- .7 Continue flooring over areas which will be under built-in furniture.
- .8 Continue flooring through areas to receive movable type partitions without interrupting floor pattern.
- .9 Terminate flooring at centreline of door in openings where adjacent floor finish or colour is dissimilar.
- .10 Install metal edge strips at unprotected or exposed edges where flooring terminates.

3.4 INSTALLATION: FLOOR TILE

- .1 Lay flooring with joints parallel to building lines to produce symmetrical tile pattern. Border tiles minimum half tile width.
- .2 Install flooring to pattern as directed.
- .3 As installation progresses and after installation is complete, roll resilient tile flooring in accordance with manufacture's instructions.

3.5 INSTALLATION: BASE

- .1 Lay out base to keep number of joints at minimum.
- .2 Clean substrate and prime with one coat of adhesive.
- .3 Apply adhesive to back of base.
- .4 Set base against wall and floor surfaces tightly by using 3 kg hand roller.
- .5 Install straight and level to variation of 1:1000.
- .6 Scribe and fit to door frames and other obstructions. Use premoulded end pieces at flush door frames.

- .7 Cope internal corners. Use premoulded corner units for right angle external corners. Use formed straight base material for external corners of other angles.
- .8 Use toeless type base where floor finish will be carpet, coved type elsewhere.
- .9 Install toeless type base before installation of carpet on floors.
- .10 Heat weld base in accordance with manufacturer's printed instructions.

3.6 INSTALLATION: ACCESSORIES

- .1 Install feature strips and floor markings where indicated. Fit joints tightly.

3.7 FIELD QUALITY CONTROL

- .1 Manufacturer's Field Services:
 - .1 Provide manufacturer's field services consisting of product use recommendations and periodic site visits for inspection of product installation in accordance with manufacturer's instructions.

3.8 CLEANING

- .1 Proceed in accordance with Section 01 74 11 - Cleaning.
- .2 Remove excess adhesive from floor, base and wall surfaces without damage.
- .3 Clean, seal and wax floor and base surface to flooring manufacturer's printed instructions.

3.9 PROTECTION

- .1 Protect new floors from time of final set of adhesive until final inspection.
- .2 Prohibit traffic on floor for 48 hours after installation.

END OF SECTION

Part 1 General

1.1 SUMMARY

- .1 This Section includes resinous flooring systems with epoxy body and covered base.
- .2 Related Requirements:
 - .1 Section 03 35 00 – Concrete Finishing
 - .2 Section 07 92 00 – Sealants
 - .3 Section 09 99 99 – Materials List

 - .2 Canada Green Building Council (CaGBC):
 - .1 LEED Canada V4 – Building Design and Construction (BD+C).

1.3 ADMINISTRATIVE REQUIREMENTS

- .1 Convene pre-installation meeting one week prior to beginning work of this Section, with Contractor, Consultant, installer, manufacturer's representative to:
 - .1 Verify project requirements.

- .2 Review installation and substrate conditions.
- .3 Co-ordination with other building subtrades.
- .4 Review manufacturer's installation instructions and warranty requirements.

1.4 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Submit product data in accordance with Section 01 33 00 – Submittal Procedures.
 - .1 Submit manufacturer's technical data, application instructions, and general recommendations for each resinous flooring material required.
- .2 Submit samples in accordance with Section 01 33 00 – Submittal Procedures:
 - .1 Verification Sample: submit 150 mm x 150 mm samples of each type of resinous flooring required, applied to a rigid backing, in colour and finish indicated.
- .3 Installer Certificates: Signed by manufacturer certifying that installers comply with specified requirements.
- .4 Manufacturer's Field Reports: submit to manufacturer's written reports within 3 days of review, verifying compliance of Work, as described in PART THREE - FIELD QUALITY CONTROL.
- .5 LEED Submittals: provide LEED submittals in accordance with Section 01 61 01 – LEED Product Requirements.

1.5 CLOSEOUT SUBMITTALS:

- .1 Submit in accordance with Section 01 78 00 – Closeout Submittals.
 - .1 Submit copies of manufacturer's written maintenance information for inclusion in the operations manual including specific warning of any maintenance practice or materials that may damage or disfigure the finished Work.

1.6 QUALITY ASSURANCE

- .1 Regulatory Requirements: materials, including primers, resins, curing agents, finish coats, aggregates and sealants are manufactured and tested under an ISO 9001 registered quality system.
- .2 Qualifications: Provide proof of qualifications when requested by Consultant:
 - .1 Manufacturers: Obtain primary materials from a single manufacture with not less than ten years of successful experience in manufacturing and installing principal materials described in this Section. Contractor shall have completed at least five projects of similar size and complexity.
 - .2 Applicators: Use experienced applicators as approved by materials manufacturer who have completed a minimum of ten applications similar in material and extent to those indicated and whose work has a record of successful in service performance.
- .3 Single-Source Responsibility: Obtain primary resinous flooring materials, including primers, resins, hardening agents, grouting coats, and topcoats, through one source from a single manufacturer. Provide secondary materials,

including patching and fill material, joint sealant, and repair materials, of type and from source recommended by manufacturer of primary materials.

.4 Mock-Ups:

.1 Provide required mock-up in accordance with Section 01 45 00 – Quality Control and as follows:

- .1 Apply mockups to verify selections made under sample submittals and to demonstrate aesthetic effects and set quality standards for materials and execution.
- .2 Apply full-thickness mockups on 10 m² floor area selected by Consultant.
- .3 Include 1 m length of integral cove base.
- .4 Reviewed mockups may become part of the completed Work if undisturbed at time of Substantial Performance.

1.7 DELIVERY, STORAGE, AND HANDLING

- .1 Deliver materials in original packages and containers, with seals unbroken, bearing manufacturer's labels indicating brand name and directions for storage and mixing with other components.
- .2 Store materials to prevent deterioration from moisture, heat, cold, direct sunlight, or other detrimental effects.
- .3 Materials used shall be factory pre-weighed and pre-packaged in single, easy to manage batches to eliminate on site mixing errors. No on-site weighing or volumetric measurements allowed.
- .4 Packaging Waste Management
 - .1 Separate and recycle waste materials in accordance with Section 01 74 19 – Construction Waste Management.

1.8 SITE CONDITIONS

- .1 Ambient Conditions:
 - .1 Comply with resinous flooring manufacturer's written instructions for substrate temperature, ambient temperature, moisture, ventilation, and other conditions affecting resinous flooring application.
 - .2 Maintain material and substrate temperature between 18°C and 30°C during resinous flooring application and for not less than 24 hours after application.
- .2 Site Conditions:
 - .1 Lighting: Provide permanent lighting or, if permanent lighting is not in place, simulate permanent lighting conditions during resinous flooring application.
 - .2 Close spaces to traffic during resinous flooring application and for not less than 24 hours after application, unless manufacturer recommends a longer period.
 - .3 Concrete substrate shall be properly cured for a minimum of 30 days. A vapor barrier must be present for concrete subfloors on or below grade.

Otherwise, an osmotic pressure resistant grout must be installed prior to the resinous flooring.

1.9 WARRANTY

- .1 Provide manufacturer's written warranty covering both material and workmanship for a period of one full year from date of Substantial Performance, or provide a joint and several warranty signed on a single document by material manufacturer and applicator jointly and severally warranting the materials and workmanship for a period of one full year from date of Substantial Performance.

Part 2 Products

2.1 MANUFACTURERS

- .1 Acceptable Manufacturers: Subject to compliance with requirements in this Section and as recommended by the manufacturer, manufacturers offering products that may be incorporated into the Work include the following:
 - .1 MAPEI Inc.
 - .2 Sika Canada Inc.
 - .3 Stonhard Group.

2.2 MATERIALS

- .1 Basis-of-Design Materials: Materials and colours listed below form the Basis-of-Design materials for this project.
- .2 Materials other than named products Basis-of-Design materials may be acceptable to the Consultant; submit information in accordance with Section 01 62 00 – Product Options and Substitutions no later than seven days prior to bid closing date and as follows:
 - .1 Proposed alternates shall match colour range, texture and performance characteristics of named products, and shall not require a change to colour board for Project.
 - .2 Proposed alternates found acceptable by Consultant will be listed in an Addendum.
 - .3 The Consultant is not obliged to accept any materials presented for their review and does not need to provide reasons for rejection of proposed alternates.

2.3 COMPONENTS

- .1 Resinous Flooring (EC1): troweled mortar base with broadcast topping. Liquid rich, slurry type systems will not be accepted.
 - .1 System Characteristics:
 - .1 Colour and Pattern: as indicated in Finish Schedule or as selected by Consultant from manufacturer's standards.
 - .2 Wearing Surface: medium.
 - .3 Integral Cove Base: as indicated in Finish Schedule or as directed by Consultant.

- .4 Overall System Thickness: nominal 6 mm.
- .2 System Components: Manufacturer's standard components that are compatible with each other and as follows:
 - .1 Primer:
 - .1 Resin: epoxy.
 - .2 Formulation Description: two component, 100 percent solids.
 - .3 Application Method: squeegee and roller.
 - .4 Number of Coats: one.
 - .5 Basis of Design Materials:
 - .1 Standard Primer, Stonhard Group.
 - .2 Mortar Base:
 - .1 Resin: epoxy.
 - .2 Formulation Description: three component, 100 percent solids.
 - .3 Application Method: metal trowel.
 - .1 Thickness of Coats: nominal 4 mm.
 - .2 Number of Coats: one.
 - .4 Aggregates: pigmented blended aggregate.
 - .5 Basis-of-Design Materials:
 - .1 Stonshield HRI Base, Stonhard Group.
 - .3 Undercoat:
 - .1 Resin: epoxy.
 - .2 Formulation Description: two-component, 100% solids, UV stable.
 - .3 Type: clear.
 - .4 Finish: gloss.
 - .5 Number of Coats: one.
 - .6 Basis-of-Design Materials:
 - .1 Stonshield undercoat, Stonhard Group.
 - .4 Broadcast Media:
 - .1 Type: pigmented.
 - .2 Number of Coats: one.
 - .3 Pattern: confirm with Consultant.
 - .4 Basis-of-Design Materials:
 - .1 Stonshield quartz aggregate, Stonhard Group.
 - .5 Sealer:
 - .1 Resin: epoxy.
 - .2 Formulation Description: two-component, 100% solids, UV stable.
 - .3 Type: clear.
 - .4 Finish: flat.
 - .5 Number of Coats: one.

- .6 Texture level: medium.
- .7 Basis-of-Design Materials:
 - .1 Stonshield Sealer, Stonhard Group.
- .3 System Physical Properties: Provide resinous flooring system with the following minimum physical property requirements when tested according to test methods indicated:
 - .1 Compressive Strength: 10,000 psi after 7 days per ASTM C579.
 - .2 Tensile Strength: 2,000 psi per ASTM C307.
 - .3 Flexural Strength: 4,300 psi per ASTM C580.
 - .4 Water Absorption: < 1% per ASTM C413.
 - .5 Impact Resistance: > 160 in. lbs. per ASTM D2794.
 - .6 Flammability: Class 1 per ASTM E648.
 - .7 Hardness: 85 to 90, Shore D per ASTM D2240.
- .4 Acceptable Materials:
 - .1 Sikafloor® Quartzite® HDB System, Sika Canada.
 - .2 Stonshield HRI®, Stonhard Group.
- .2 Resinous Flooring (RC1): troweled mortar base with broadcast topping. Liquid rich, slurry type systems will not be accepted.
 - .1 System Characteristics:
 - .1 Colour and Pattern: as indicated in Finish Schedule or as selected by Consultant from manufacturer's standards.
 - .2 Wearing Surface: medium
 - .3 Integral Cove Base: 203 mm high and as indicated in Finish Schedule.
 - .4 Overall System Thickness: nominal 6 mm
 - .2 System Components: Manufacturer's standard components that are compatible with each other and as follows:
 - .1 Primer:
 - .1 Resin: epoxy
 - .2 Formulation Description: two component, 100 percent solids.
 - .3 Application Method: squeegee and roller.
 - .4 Number of Coats: one.
 - .5 Basis of Design Materials: Stonhard Standard Primer.
 - .2 Mortar Base:
 - .1 Resin: epoxy
 - .2 Formulation Description: three component, 100 percent solids.
 - .3 Application Method: metal trowel.
 - .1 Thickness of Coats: nominal 6 mm.
 - .2 Number of Coats: one.
 - .4 Aggregates: pigmented blended aggregate.
 - .5 Basis of Design Materials: Stonclad GS

- .3 Topcoat:
 - .1 Resin: epoxy
 - .2 Formulation Description: two-component, 100% solids, UV stable.
 - .3 Type: pigmented.
 - .4 Finish: standard.
 - .5 Number of Coats: two.
 - .6 Basis of Design Materials: Stonkote GS4
- .3 System Physical Properties: Provide resinous flooring system with the following minimum physical property requirements when tested according to test methods indicated:
 - .1 Compressive Strength: 10,000 psi after 7 days per ASTM C579.
 - .2 Tensile Strength: 1,750 psi per ASTM C307.
 - .3 Flexural Strength: 4,000 psi per ASTM C580.
 - .4 Water Absorption: < 1% per ASTM C413.
 - .5 Impact Resistance: > 18 Nm. per ASTM D2794.
 - .6 Flammability: Class 1 per ASTM E648.
 - .7 Hardness: 85 to 90, Shore D per ASTM D2240.
- .4 Basis of Design:
 - .1 Stonhard, Stonclad GS

2.4 ACCESSORIES

- .1 Patching and Fill Material: Resinous product of or approved by resinous flooring manufacturer and recommended by manufacturer for application indicated.
- .2 Joint Sealant: Type recommended or produced by resinous flooring manufacturer for type of service and joint condition indicated.

Part 3 Execution

3.1 PREPARATION

- .1 General: Prepare and clean substrates according to resinous flooring manufacturer's written instructions for substrate indicated. Provide clean, dry, and neutral Ph substrate for resinous flooring application.
- .2 Concrete Substrates: Provide sound concrete surfaces free of laitance, glaze, efflorescence, curing compounds, form-release agents, dust, dirt, grease, oil, and other contaminants incompatible with resinous flooring.
 - .1 Mechanically prepare substrates as follows:
 - .1 Shot-blast surfaces with an apparatus that abrades the concrete surface, contains the dispensed shot within the apparatus, and recirculates the shot by vacuum pickup.
 - .2 Comply with ASTM C811 requirements, unless manufacturer's written instructions are more stringent.
 - .2 Repair damaged and deteriorated concrete according to resinous flooring manufacturer's written recommendations.

- .3 Verify that concrete substrates are dry.
 - .1 Perform in situ probe test, ASTM F2170. Proceed with application only after substrates do not exceed a maximum potential equilibrium relative humidity of 75 percent.
 - .2 Perform anhydrous calcium chloride test, ASTM F1869. Proceed with application only after substrates have maximum moisture-vapor-emission rate of 5 lb of water/1000 sq. ft. of slab in 24 hours.
 - .3 Perform additional moisture tests recommended by manufacturer. Proceed with application only after substrates pass testing.
- .4 Verify that concrete substrates have neutral Ph and that resinous flooring will adhere to them. Perform tests recommended by manufacturer. Proceed with application only after substrates pass testing.
- .3 Resinous Materials: Mix components and prepare materials according to resinous flooring manufacturer's written instructions.
- .4 Use patching and fill material to fill holes and depressions in substrates according to manufacturer's written instructions.
- .5 Treat control joints and other nonmoving substrate cracks to prevent cracks from reflecting through resinous flooring according to manufacturer's written recommendations.

3.2 APPLICATION

- .1 General: Apply components of resinous flooring system according to manufacturer's written instructions to produce a uniform, monolithic wearing surface of thickness indicated.
 - .1 Coordinate application of components to provide optimum adhesion of resinous flooring system to substrate, and optimum intercoat adhesion.
 - .2 Cure resinous flooring components according to manufacturer's written instructions. Prevent contamination during application and curing processes.
 - .3 At substrate expansion and isolation joints, provide joint in resinous flooring to comply with resinous flooring manufacturer's written recommendations.
 - .1 Apply joint sealant to comply with manufacturer's written recommendations.
- .2 Apply primer where required by resinous system, over prepared substrate at manufacturer's recommended spreading rate.
- .3 Integral Cove Base: apply cove base mix to wall surfaces before applying flooring. Apply according to manufacturer's written instructions and details including those for taping, mixing, priming, troweling, sanding, of cove base. Round internal and external corners.
- .4 Apply metal trowel single mortar coat in thickness indicated for flooring system. Hand or power trowel and grout to fill voids. When cured, sand to remove trowel marks and roughness.

- .5 Undercoat: Remove any surface irregularities by lightly abrading and vacuuming the floor surface. Mix and apply undercoat with strict adherence to manufacturer's installation procedures and coverage rates.
- .6 Broadcast Media: Immediately broadcast quartz silica aggregate into the undercoat using manufacturer's specially designed spray caster. Strict adherence to manufacturer's installation procedures and coverage rates is imperative.
- .7 Apply topcoat(s) in number of coats indicated for flooring system and at spreading rates recommended in writing by manufacturer.

3.3 TERMINATIONS

- .1 Chase edges to "lock" the coating system into the concrete substrate along lines of termination.
- .2 Penetration Treatment: Lap and seal coating onto the perimeter of the penetrating item by bridging over compatible elastomer at the interface to compensate for possible movement.
- .3 Trenches: Continue coating system into trenches to maintain monolithic protection. Treat cold joints to assure bridging of potential cracks.
- .4 Treat floor drains by chasing the coating to lock in place at point of termination.

3.4 JOINTS AND CRACKS

- .1 Treat control joints to bridge potential cracks and to maintain monolithic protection.
- .2 Treat cold joints and construction joints to bridge potential cracks and to maintain monolithic protection on horizontal and vertical surfaces as well as horizontal and vertical interfaces.
- .3 Discontinue floor coating system at vertical and horizontal contraction and expansion joints by installing backer rod and compatible sealant after coating installation is completed. Provide sealant type recommended by manufacturer for traffic conditions and chemical exposures to be encountered.

3.5 FIELD QUALITY CONTROL

- .1 Have manufacturer of products supplied under this Section review Work involved in handling, installation/application, protection and cleaning of its products, and submit written reports in acceptable format to verify compliance of Work with Contract.
- .2 Manufacturer's field services: provide manufacturer's field services consisting of product use recommendations and periodic site visits for inspection of product installation in accordance with manufacturer's instructions.
- .3 Schedule site visits to review Work at stages listed:
 - .1 After delivery and storage of products, and when preparatory Work on which Work of this Section depends is complete, but before installation begins.
 - .2 Twice during progress of Work at 25% and 60% complete.
 - .3 Upon completion of Work, after cleaning is carried out.

- .4 Obtain reports within three days of review and submit.
- .5 Material Sampling: Owner may at any time and any numbers of times during resinous flooring application require material samples for testing for compliance with requirements.
 - .1 Owner will engage an independent testing agency to take samples of materials being used. Material samples will be taken, identified, sealed, and certified in presence of Contractor.
 - .2 Testing agency will test samples for compliance with requirements, using applicable referenced testing procedures or, if not referenced, using testing procedures listed in manufacturer's product data.
 - .3 If test results show applied materials do not comply with specified requirements, pay for testing, remove noncomplying materials, prepare surfaces coated with unacceptable materials, and reapply flooring materials to comply with requirements.

3.6 CURING

- .1 Cure resinous flooring materials in compliance with manufacturer's directions, taking care to prevent contamination during stages of application and prior to completion of curing process. Close area of application for a minimum of 18 hours after application.

3.7 CLEANING

- .1 Cleaning: Remove temporary covering and clean resinous flooring just prior to final inspection. Use cleaning materials and procedures recommended by resinous flooring manufacturer.

3.8 PROTECTION

- .1 Protect resinous flooring materials from damage and wear during construction operation. Where temporary covering is required for this purpose, comply with manufacturer's recommendations for protective materials and method of application.
- .2 Protect surfaces after final coats.

END OF SECTION

Part 1 General

1.1 SUMMARY

- .1 Section Includes:
 - .1 Printable vinyl wall film.
- .2 Related Requirements:
 - .1 Section 09 91 00 – Painting

1.2 REFERENCES

- .1 Reference Standards:
 - .1 American Society for Testing and Materials (ASTM):
 - .1 ASTM D1004-21, Standard Test Method for Tear Resistance (Graves Tear) of Plastic Film and Sheeting.
 - .2 ASTM D3330/D3330M-04(2018), Standard Test Method for Peel Adhesion of Pressure-Sensitive Tape.
 - .3 ASTM E84-23d, Standard Test Method for Surface Burning Characteristics of Building Materials.
 - .2 Canada Green Building Council (CaGBC):
 - .1 LEED Canada V4 – Building Design and Construction (BD+C).

1.3 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Submit product data in accordance with Section 01 33 00 – Submittal Procedures:
 - .1 Submit manufacturer's printed product literature, specifications and data sheet.
 - .2 Submit Workplace Hazardous Materials Information System WHMIS SDS - Safety Data Sheets in accordance with WHMIS acceptable to Labour Canada, and Health and Welfare Canada.
- .2 Submit samples in accordance with Section 01 33 00 – Submittal Procedures (after meeting with Consultant as indicated in Quality Assurance):
 - .1 Submit two 610 x 610 mm samples of glazing film of each product specified. Submit one strike off sample for each glazing and wall location showing custom vinyl graphic. Allow for one revision and resubmittal.
- .3 LEED Submittals: provide LEED submittals in accordance with Section 01 61 00 – LEED Product Requirements.

1.4 CLOSEOUT SUBMITTALS

- .1 Submit copies of warranty to be issued including conditions and limitations.
- .2 Submit Closeout Submittals in accordance with Section 01 78 00 – Closeout Submittals.
 - .1 Submit maintenance and cleaning instructions describing proper cleaning procedures and proper cleaning solutions.

- .2 Follow manufacturers written instructions for care and maintenance of security and safety film.
- .3 Use only cleaning solution recommended by manufacturer for regularly scheduled cleaning of security film.

1.5 QUALITY ASSURANCE

- .1 Meetings: Supplier must attend one meeting at office of the Consultant to discuss the package prior to printing samples.
- .2 Film installation Subcontractor to be factory approved and have a minimum of three years documented experience on not less than five similar installations.
- .3 Use adequate numbers of skilled workmen, thoroughly trained and experienced in the installation of this film system.

1.6 DELIVERY, STORAGE, AND HANDLING

- .1 Deliver, store and handle materials in accordance with Section 01 61 01 – LEED Product Requirements.
- .2 Provide and maintain dry, off-ground weatherproof storage.
- .3 Store rolls of film flat on cross supports. Do not stand rolls of film on end.
- .4 Remove from storage, in quantities required for same day use.
- .5 Store materials in accordance with manufacturers written instructions.
- .6 Packaging Waste Management
 - .1 Separate and recycle waste materials in accordance with Section 01 74 19 – Construction Waste Management.

1.7 WARRANTY

- .1 Provide warranty for film to include in maintenance manuals as specified in Section 01 78 00 – Closeout Submittals.

Part 2 Products

2.1 FILMS

- .1 Printable Wall Film: vinyl film, adhered to metal surfaces, computer generated and cut. Provide letters and shapes as indicated on Drawings in size and font as indicated on Drawings.
- .2 Colours: as indicated on Drawings or as directed by Consultant.

Part 3 Execution

3.1 EXAMINATION

- .1 Examine substrates for compliance with requirements for non-porous, smooth surface and other conditions affecting the performance of work in this section. Do not proceed with installation until unsatisfactory conditions have been corrected.

- .2 Refer to manufacturer's installation guide to determine compatibility of finish to substrate.
- .3 Do not proceed with installation until unsatisfactory conditions have been corrected.
- .4 Proceed with installation only on surfaces which are satisfactory.

3.2 PREPARATION

- .1 Comply with manufacturer's instructions for surface preparation and as follows:
 - .1 Provide smooth substrate to avoid telegraphing of surface texture.
 - .2 Ensure that the existing paint, surface finish, or wall covering has excellent bond to the substrate area where material will be applied.
 - .3 Repair, prime and paint the substrate as required.
 - .4 An adhesion promoter maybe required to increase adhesion.
 - .5 Temperature and humidity are within recommended range.
- .2 Test and prepare surfaces in accordance with manufacturer's installation guide and as follows:
 - .1 Use manufacturer's recommended wall adhesion test to determine the compatibility of the application surface with the film material.
 - .2 Use manufacturer's recommended enhanced cleaning method to ensure that the application surface is ready to received the hold film materials.
- .3 Repair damaged application surfaces per manufacturer's installation guide.
- .4 Re-clean application surface with a lint-free cloth and in accordance with manufacturer's installation guide.

3.3 INSTALLATION

- .1 Install in accordance with manufacturer's written instructions.
- .2 Perform application by a qualified installer approved by manufacturer.
- .3 Do not proceed with installation until finishing work has been completed in and around the work area.
- .4 Measure the application surface and cut film to size with a minimum 13 mm extra on all side for trimming.
- .5 Install substrates with no gaps, wire seams, or overlaps. Form smooth, wrinkle-free, bubble-free surface for finished installation.
- .6 No exposed joints on corners or other open type joints permitted.
- .7 Verify pattern prior to material acquisition.
- .8 Apply over properly prepared substrates.
- .9 Remove air bubbles, wrinkles and blisters. Use procedures to prevent the formation of air bubbles, wrinkles, blisters and other defects.

3.4 CLEANING

- .1 Use cleaning methods recommended by manufacturer for applicable environment.
- .2 Remove debris and leave areas neat and clean.

3.5 PROTECTION

- .1 Protect completed film during remainder of construction period.

END OF SECTION

Part 1 General

1.1 SUMMARY

- .1 Section Includes:
 - .1 This Section includes surface preparation and field painting of exposed exterior and interior items and surfaces.
 - .2 Provide labour, materials, tools and other equipment, services and supervision required to complete interior and exterior, including above roof, painting and decorating work.
 - .3 Surface preparation for this section will be limited to priming and back-priming, and specific pre-treatments noted in this section or as specified in the Master Painters Institute (MPI) Painting Specification Manual.
- .2 Related Requirements:
 - .1 Technical sections as indicated.

1.2 REFERENCES

- .1 Reference Standards:
 - .1 American Society for Testing and Materials International (ASTM):
 - .1 ASTM F1869-23, Standard Test Method for Measuring Moisture Vapor Emission Rate of Concrete Subfloor Using Anhydrous Calcium Chloride.
 - .2 Canada Green Building Council (CaGBC):
 - .1 LEED Canada V4 – Building Design and Construction (BD+C).
 - .3 The Master Painters Institute (MPI):
 - .1 Approved Products List
 - .2 Architectural Painting Specification Manual.
 - .3 Maintenance Repainting/Restoration Manual.
 - .4 The Society for Protective Coatings (SSPC):
 - .1 SSPC Paint Series, Paint Guidelines.
 - .2 SSPC SP Series, Surface Preparation Guidelines.
 - .3 SSPC-PA Series, Paint Application Guidelines.
 - .5 Underwriters Laboratories ECOLOGO Certification Program (UL):
 - .1 UL 2768, Architectural Surface Coatings (formerly CCD 47).

1.3 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Comply with requirements of Section 01 33 00 – Submittal Procedures.
- .2 Action Submittals: Provide the following submittals before starting any work of this Section:
 - .1 Product Data: Submit list of all painting materials used for the Work to the Consultant for review prior to ordering materials for each paint system indicated, including block fillers and primers:
 - .1 Material List: An inclusive list of required coating materials indicating each material and cross reference specific coating,

- finish system, and application; identify each material by manufacturer's catalogue number and general classification.
 - .2 Base Information: Confirmation of manufacturer's ability to supply paint in a variety of base tints, specific to the range of colours being used on this project; indicate colour of base tint used and amount of colourant added to establish Scheduled colours.
 - .3 Manufacturer's Information: Manufacturer's technical information, including label analysis and instructions for handling, storing, and applying each coating material.
- .2 Samples: Provide stepped samples, defining each separate coat, including block fillers and primers using representative colours required for the project; label each sample for location and application, and as follows:
- .1 Samples for Verification: When requested by the Consultant, provide samples for each colour and material, with texture to simulate actual conditions, on representative samples of the actual substrate as follows:
 - .1 Painted Wood: 200 mm long or square samples for each colour and material on representative sample wood used for the Work.
 - .2 Stained or Natural Wood: 200 mm long or square samples of natural or stained wood finish on representative species of wood used for the Work.
 - .3 Painted Gypsum Board: 200 mm long or square samples for each colour and material.
- .3 Informational Submittals: Provide the following submittals when requested by the Consultant:
- .1 Certification: Submit certification reports for paint products indicating that they meet or exceed low VOC and coloured base requirements listed in this Section.
 - .2 Purchase Orders: Retain purchase orders, invoices and other documents for verification of compliance with specification and design requirements.
 - .3 Submit written proof of ability to supply a 100% two year Maintenance Bond, if Paint Association warranty option is not used with Bid Submission.
 - .4 Submit a list of all painting materials to the Consultant and the Paint Inspection Agency for review prior to ordering materials. If requested, provide an invoice list of all paint materials ordered for project work to Paint Inspection Agency indicating manufacturer, types and quantities for verification and compliance with specification and design requirements.
 - .5 Submit Workplace Hazardous Materials Information System WHMIS SDS - Safety Data Sheets acceptable to Labour Canada and Health Canada prior to commencement of work for review and for posting at job site as required.
 - .6 Submit work schedule for various stages of work for the Consultant's review and Owner's approval when painting occupied areas, if requested.

- .7 Provide an itemized list complete with manufacturer, paint type and colour coding for all colours used for Owner's later use in maintenance for use in the operations and maintenance manual specified in Section 01 78 00 - Closeout Submittals.
- .4 LEED Submittals: provide LEED submittals in accordance with Section 01 61 01 – LEED Product Requirements.

1.4 CLOSEOUT SUBMITTALS

- .1 Operation and Maintenance Data: Submit copies of paint manufacturer's written maintenance information for inclusion in the operations manual in accordance with Section 01 78 00 – Closeout Submittals including specific warning of any maintenance practice or materials that may damage or disfigure the finished Work.

1.5 QUALITY ASSURANCE

- .1 Conform to the standards contained in the MPI Maintenance Repainting/Restoration Manual or MPI Architectural Painting Specification Manual.
- .2 Applicator Qualifications: A firm or individual experienced in applying paints and coatings similar in material, design, and extent to those indicated for this Project, whose work has resulted in applications with a record of successful in service performance, and as follows:
 - .1 Have a minimum of five years proven satisfactory experience and shall show proof before commencement of work that he will maintain a qualified crew of painters throughout the duration of the work.
 - .2 When requested provide a list of the last three comparable jobs including, name and location, specifying authority, start and completion dates and cost amount of the painting work.
 - .3 Only qualified journeymen who have a Tradesman Qualification Certificate of Proficiency shall be engaged in painting and decorating work.
 - .4 Apprentices may be employed provided they work under the direct supervision of a qualified journeyman in accordance with trade regulations.
 - .5 Materials, preparation and workmanship shall conform to the standards contained in the latest edition of the MPI Maintenance Repainting/Restoration Manual or MPI Architectural Painting Specification Manual.
- .3 Painting work shall be inspected by a Paint Inspection Agency (Inspector) designated by the Consultant, and paid for by this section as follows:
 - .1 Inspector will be recognized by the local MPI Accredited Quality Assurance Association.
 - .2 Applicator shall notify the Paint Inspection Agency a minimum of one week prior to commencement of work and provide a copy of the project painting specification, plans and elevation drawings, finish schedules and other pertinent details as required.

- .4 Paint manufacturer shall provide certification of all surfaces and conditions for specific paint or coating system application as well as on site supervision, inspection and approval of their paint or coating system application as required at no additional cost to the Owner where "special" coatings or decorating systems (i.e.: textured coatings or non-MPI listed products or systems) are used in painting.
- .5 Mock-Ups:
 - .1 Prepare mock-ups in accordance with Section 01 45 00 – Quality Control.
 - .2 Prepare and paint a designated interior and exterior surface, area, room or item to requirements of this section using specified paint or coating to indicate selected colours, gloss, sheen, texture and workmanship to MPI Painting Manual standards for review and acceptance by Consultant and Painting Inspector.
 - .3 Accepted surface, area, room or items shall become the standard of finish quality and workmanship for similar on-site painting work.

1.6 DELIVERY, STORAGE, AND HANDLING

- .1 Deliver painting materials in sealed, original labelled containers bearing manufacturer's name, brand name, type of paint or coating and colour designation, standard compliance, materials content as well as mixing and/or reducing and application requirements.
- .2 Store paint materials in original labelled containers in a secure (lockable), dry, heated and well ventilated single designated area meeting the minimum requirements of both paint manufacturer and authorities having jurisdiction and at a minimum ambient temperature of 7°C. Store only materials used on this project on site.
- .3 Provide adequate fireproof storage lockers, take necessary precautions, and post warning signs (i.e.: no smoking) where toxic, volatile, explosive, or flammable materials are being used or stored, as follows:
 - .1 Take necessary precautions and safety measures to prevent fire hazards and spontaneous combustion, and to protect the environment from spills.
 - .2 Materials considered to constitute a fire hazard include, but are not limited to, paints, solvents, drop clothes and similar materials.
 - .3 Storage containers considered as adequate include but are not limited to; manufacturers original closed and rated containers.
 - .4 Remove empty open containers from the site on a daily basis.
 - .5 Provide adequate storage facilities.
- .4 Packaging Waste Management
 - .1 Separate and recycle waste materials in accordance with Section 01 74 19 – Construction Waste Management.

1.7 SITE CONDITIONS

- .1 Perform interior and exterior painting work only when ambient air and substrate temperatures and humidity level is within the manufacturer's recommended performance range.

- .2 Provide continuous ventilation and sufficient heating facilities to maintain minimum ambient air and substrate temperatures for 24 hours before, during and after paint application.
- .3 Provide supplemental ventilating and heating equipment where ventilation and heating from existing system is not adequate to meet minimum safety and performance requirements; gas fired heating units will not be permitted, unless accepted in writing by the Consultant and authorities having jurisdiction.
- .4 Test substrate surfaces (concrete, masonry, plaster and wood) for moisture and alkalinity using a properly calibrated electronic Moisture Meter, except that concrete floors can be tested using a cover patch test; maximum moisture shall not exceed:
 - .1 12% for concrete and masonry (clay and concrete brick, and concrete block), use concrete test ASTM F1869 for concrete floors.
 - .2 15% for wood.
 - .3 12% for plaster and gypsum board.
- .5 Provide a minimum lighting level of 323 Lux (30 foot candles) on surfaces being painted.
- .6 Apply paint only to dry, clean, and adequately prepared surfaces in areas where dust is no longer generated by construction activities such that airborne particles will not affect the quality of finished surfaces.
- .7 Additional exterior application requirements:
 - .1 Perform no exterior painting work when the ambient air and substrate temperatures are below 10°C.
 - .2 Perform no exterior painting work unless environmental conditions are within MPI and paint manufacturer's requirements or until adequate weather protection is provided. Where required, provide suitable weatherproof covering and sufficient heating facilities to maintain minimum ambient air and substrate temperatures for 24 hours before, during and after paint application.
 - .3 Perform no exterior painting work when the relative humidity is above 85% or when the dew point is less than 3°C variance between the air/surface temperature.

1.8 GUARANTEE

- .1 Furnish a two year Painting Association Guarantee or a 100% two year Maintenance Bond both in accordance with MPI Painting Manual requirements, and as follows:
 - .1 Obtain the Maintenance Bond from an approved bonding company and that warrants that all painting work has been performed in accordance with MPI Painting Manual requirements.
 - .2 Provide written proof of ability to submit Maintenance Bond at time of bidding, submitted with Bid.
- .2 All painting and decorating work shall be in accordance with MPI Painting Manual requirements and shall be inspected by the local MPI Accredited Quality Assurance Association's Paint Inspection Agency (inspector), whether using

either the MPI Accredited Quality Assurance Association's guarantee, or the Maintenance Bond option. The cost for such inspections, and for either the local MPI Accredited Quality Assurance Association's Guarantee, or the Maintenance Bond, shall be included in the Base Bid Price.

- .3 Painting and decorating Subcontractors choosing the Maintenance Bond option shall provide a maintenance bond consent from a reputable surety company licensed to do business in Canada. Cash or certified check are not acceptable in lieu of surety consent.

Part 2 Products

2.1 MATERIALS

- .1 Primers, paints, coatings, varnishes, stains, lacquers, fillers, thinners, solvents, and other painting materials shall be in accordance with the MPI Manual "Approved Product" listing and shall be from a single manufacturer for each system used.
- .2 Materials such as linseed oil, shellac, and other accessory materials shall be the highest quality product of an approved manufacturer listed in the MPI Manual and shall be compatible with other coating materials.
- .3 All materials and paints shall be lead and mercury free and shall have low VOC content where possible.
- .4 Use only MPI listed L rated materials and confirm VOC limits are met for version of LEED as required.
- .5 Unless otherwise specified, all painting work shall be done in accordance with MPI Premium Grade requirements.

2.2 COLOURS

- .1 Colours: as indicated on Finish Schedule on Drawings.
- .2 Second coat in three coat system to be tinted slightly lighter colour than top coat to show visible difference between coats.

2.3 GLOSS/SHEEN RATINGS

- .1 Paint gloss shall be defined as the sheen rating of applied paint, in accordance with the following MPI gloss / sheen standard values:

Gloss Level	Description	Units @ 60 degrees	Units @ 85 degrees
G1	Matte or Flat finish	0 to 5	10 maximum
G2	Velvet finish	10 maximum	10 to 35
G3	Eggshell finish	10 to 25	10 to 35
G4	Satin finish	20 to 35	35 minimum
G5	Semi-Gloss finish	35 to 70	
G6	Gloss finish	70 to 85	
G7	High-Gloss finish	> 85	

- .2 Gloss level ratings of painted surfaces as indicated.

Part 3 Execution

3.1 PREPARATION

- .1 Prepare surfaces in accordance with MPI Manual requirements. Refer to the Manual for specific surface preparation requirements for each substrate material.
- .2 No painting work shall commence until all such adverse conditions and defects have been corrected and surfaces and conditions are acceptable to the Painting Subcontractor and Inspection Agency.

3.2 APPLICATION

- .1 Paint when substrates and environmental conditions (heating, ventilation, lighting and completion of other work) are acceptable for applications of products specified in this Section.
- .2 Paint surfaces requiring paint or stain finish to Premium MPI Manual finish requirements with application methods in accordance with best trade practices for type and application of materials used.
- .3 Continue paint finishes through behind wall mounted items.
- .4 Painting coats specified are intended to cover surfaces satisfactorily when applied at proper consistency and in accordance with manufacturer's recommendations.
- .5 Apply a minimum of four coats of paint where deep or bright colours are used to achieve satisfactory results.

3.3 EXTERIOR SURFACES

- .1 Unless otherwise specified, all exterior painting work to be in accordance with MPI Premium Grade finish requirements.
- .2 Asphalt Surfaces: (zone / traffic marking for drive and parking areas, etc.)
 - .1 EXT 2.1A Latex zone / traffic marking finish.
- .3 Structural Steel and Metal Fabrications: columns, beams, joists and miscellaneous metal:
 - .1 EXT 5.1R Water Based Light Industrial - gloss level as directed (over H.B. Epoxy).
- .4 Steel - High Heat: heat exchangers, breeching, pipes, flues, stacks, etc., with temperature range as noted:
 - .1 EXT 5.2A - Heat resistant enamel finish, maximum 205 degrees C.
 - .2 EXT 5.2B - Heat resistant aluminum enamel finish, maximum 427 degrees C.
 - .3 EXT 5.2C - Inorganic zinc rich coating, maximum 400 degrees C.
 - .4 EXT 5.2D - High heat resistant coating, maximum 593 degrees C.
- .5 Galvanized Metal: non chromate passivated; high contact/high traffic areas (doors, frames, railings and handrails, etc.):
 - .1 EXT 5.3M – W.B. Light Industrial Coating (over w.b. galvanized primer), gloss level as directed.

- .6 Dressed Lumber: Cedar soffit and siding:
 - .1 EXT 6.2N - Semi-transparent stain, W.B. (do not use on doors).
 - .1 Basis-of-Design Materials:
 - .1 Minwax 350 VOC Helmsman, Satin Spar Urethane, Sherwin-Williams.
- .7 Bituminous Coated Surfaces: cast iron pipe, concrete, etc.:
 - .1 EXT 10.2A - Latex gloss level as directed.

3.4 INTERIOR SURFACES

- .1 Paint interior surfaces in accordance with the MPI Manual premium grade painting systems listed in this section.
- .2 Structural Steel and Metal Fabrications: columns, beams, joists and miscellaneous metal:
 - .1 INT 5.1R - High performance architectural latex; gloss level as directed.
- .3 Steel - high heat: (boilers, furnaces, heat exchangers, breeching, pipes, flues, stacks, etc., with temperature range as noted):
 - .1 INT 5.2A - Heat resistant enamel finish, maximum 205 degrees C.
 - .2 INT 5.2B - Heat resistant aluminum paint finish, maximum 427 degrees C.
 - .3 INT 5.2C - Inorganic zinc rich coating, maximum 400 degrees C.
 - .4 INT 5.2D - High heat resistant coating, maximum 593 degrees C.
- .4 Galvanized Metal (doors, frames, railings, misc. steel, pipes, overhead decking, ducts, etcetera):
 - .1 INT 5.3M - High performance architectural latex gloss level as directed.
- .5 Paint copper water piping, plumbing, and drainage in wash bay area as follows:
 - .1 Int 5.5 Copper: MPI 5.5B – Epoxy (over epoxy primer)
- .6 Dressed Lumber: Cedar panelling, doors, door and window frames, casings, mouldings, etc.:
 - .1 INT 6.3Q - Polyurethane varnish finish, gloss level as directed.
 - .1 Basis-of-Design Materials:
 - .1 Minwax, Sherwin-Williams.
- .7 Plaster and Gypsum Board (gypsum board, drywall, and other sheet gypsum materials):
 - .1 INT 9.2B – High performance architectural latex gloss level as directed.
- .8 Acoustic Panels and Tiles, touch up paint:
 - .1 INT 9.3A – Latex flat finish.
- .9 Bituminous Coated Surfaces: (cast iron pipe, concrete, etc.)
 - .1 INT 10.2A Latex (over w.b rust-inhibitive primer).

3.5 MECHANICAL / ELECTRICAL EQUIPMENT AND RELATED SURFACES

- .1 Unless otherwise specified or noted, paint all "unfinished" conduits, piping, hangers, ductwork and other mechanical and electrical equipment with colour and texture to match adjacent surfaces, in the following areas:
 - .1 where exposed-to-view in all exterior and interior areas.
 - .2 in all interior high humidity interior areas.
 - .3 in all boiler room, mechanical and electrical rooms.
- .2 In unfinished areas leave exposed conduits, piping, hangers, ductwork and other mechanical and electrical equipment in original finish and touch up scratches and marks.
- .3 Touch up scratches and marks on factory painted finishes and equipment with paint as supplied by manufacturer of equipment.
- .4 Do not paint over nameplates.
- .5 Paint the inside of all ductwork where visible behind louvers, grilles and diffusers for a minimum of 460 mm or beyond sight line, whichever is greater, with primer and one coat of matt black (non-reflecting) paint.

3.6 MAINTENANCE REPAINTING

- .1 Paint existing interior previously finishes surfaces in accordance with the MPI Manual painting systems listed in this section.

3.7 RESTORATION

- .1 Clean and re-install all hardware items that were removed before painting operations were undertaken, ensuring that tagged or labelled items are returned to the exact position from which they were removed.
- .2 Clean, prime and re-paint all bolts, nuts and fasteners after torqueing or re-tightening following specified paint finish.
- .3 Remove protective coverings and warning signs as soon as possible after operations cease.
- .4 Protect freshly painted surfaces from paint droppings and dust to approval of Consultant. Avoid scuffing newly applied paint.
- .5 Restore areas used for storage, cleaning, mixing and handling of paint to clean condition as approved by Consultant.

3.8 FIELD QUALITY CONTROL: STANDARD OF ACCEPTANCE

- .1 Where "special" painting, coating or decorating system applications (i.e. elastomeric coatings) or non-MPI listed products or systems are to be used, paint or coating manufacturer shall provide as part of this work, certification of surfaces and conditions for specific paint or coating system application as well as on site supervision, inspection and approval of their paint or coating system application as required at no additional cost to Consultant.
- .2 Advise Consultant when surfaces and applied coating is ready for inspection. Do not proceed with subsequent coats until previous coat has been approved.
- .3 Cooperate with inspection firm and provide access to areas of work.

- .4 Retain purchase orders, invoices and other documents to prove conformance with noted MPI requirements when requested by Consultant.
- .5 Notify the Paint Inspection Agency on award of contract and make application for assignment of an Inspector using appropriate forms supplied by the Agency as well as provide a copy of the project painting specification, drawings, colour schedule and list of proposed materials for review purposes prior to commencement of work.
- .6 Inspection
 - .1 Interior and exterior painting work shall be in accordance with MPI Painting Manual requirements and shall be inspected by the Painting Association whether using the Painting Association Guarantee or the Maintenance Bond option noted above.
 - .2 Cost for inspections and associated guaranties shall be included in the scope of work for this Section.
- .7 Fully cooperate at all times with the requirements of the Paint Inspection Agency in the performance of their duties, including providing access and assistance as required to complete inspection work, and as follows:
 - .1 All surfaces, preparation and paint applications shall be inspected.
 - .2 Painted surfaces shall be considered to lack uniformity and soundness if any of the following defects are apparent to the Painting Inspection Agency inspector:
 - .1 Brush or roller marks, streaks, laps, runs, sags, drips, heavy stippling, hiding or shadowing by inefficient application methods, skipped or missed areas, and foreign materials in paint coatings.
 - .2 Evidence of poor coverage at rivet heads, plate edges, lap joints, crevices, pockets, corners and re-entrant angles.
 - .3 Damage due to touching before paint is sufficiently dry or any other contributory cause.
 - .4 Damage due to application on moist surfaces or caused by inadequate protection from the weather.
 - .5 Damage or contamination of paint due to blown contaminants (dust, spray paint, etc.).
 - .3 Painted surfaces shall be considered unacceptable if any of the following are evident under final lighting source conditions:
 - .1 Visible defects are evident on vertical surfaces when viewed at 90° to the surface from a distance of 1000 mm.
 - .2 Visible defects are evident on horizontal surfaces when viewed at 45° to the surface from a distance of 1000 mm.
 - .3 Visible defects are evident on ceiling surfaces when viewed at 45° to the surface.
 - .4 When the final coat on any surface exhibits a lack of uniformity of sheen across full surface area.
 - .4 Painted surfaces rejected by the inspector shall be made good at the expense of the Contractor, as follows:

- .1 Small affected areas may be touched up; large affected areas or areas without sufficient dry film thickness of paint shall be repainted.
- .2 Runs, sags of damaged paint shall be removed by scraper or by sanding prior to application of paint.

3.9 CLEANING

- .1 Remove all paint where spilled, splashed, splattered or sprayed as work progresses using means and materials that are not detrimental to affected surfaces.
- .2 Keep work area free from an unnecessary accumulation of tools, equipment, surplus materials and debris.
- .3 Remove combustible rubbish materials and empty paint cans each day and safely dispose of it in accordance with requirements of authorities having jurisdiction.
- .4 Clean equipment and dispose of wash water or solvents, and other cleaning and protective materials (rags, drop cloths, masking papers, etcetera), paints, thinners, paint removers and strippers in accordance with the safety requirements of authorities having jurisdiction.

3.10 PROTECTION

- .1 Protect newly painted exterior surfaces from rain and snow, condensation, contamination, dust, salt spray and freezing temperatures until paint coatings are completely dry.
- .2 Curing periods shall exceed the manufacturer's recommended minimum time requirements.
- .3 Erect barriers or screens and post signs to warn of or limit or direct traffic away or around work area as required.

.1 Fill in schedule and submit to Consultant for review.

[illegible]

Reissued for Tender May 23, 2025

Finish Code	Material	Manufacturer & Product	Colour	Remarks
Ceiling				
C1	Acoustical Ceiling Panel	Manufacturer: Armstrong Collection: FELTWORKS Acoustical Ceiling Panels Colour: White	White	Applies to Offices, Changerooms, Meeting Room, Lunch Room
C2	Painted Exposed Structure	Painted PT2, Flat Finish	Dark Grey	Field, unless noted otherwise
C3	Acoustical Ceiling Blades	Manufacturer: Armstrong Collection: FELTWORKS Blades - HookOn Peaks and Valleys Colour: Cotton Pattern: 1	White	Applies to main corridor
C4	Acoustical Ceiling Tile	Manufacturer: Armstrong Collection: Dune, Square Lay-In Item #: 1850 Size: 610mm x 610mm x 15.9mm	White	Applies to Changerooms, First Aid Room, Universal W/C
C6	Gypsum Board	Painted PT1, Flat Finish	White	Applies to Vestibules
Floor				
EC1	Epoxy Coating	Manufacturer: Stonhard Collection: Stonshield HRI Colour: Driftwood	Medium Grey	Applies to Wash Bay, Equipment Room, Garage, Multipurpose Tool/ Parts Room, Sign Garage, Wrap up walls 150mm to form cove base
RB1	Rubber Wall base	Manufacturer: Tarkett Collection: Johnsonite Traditional Duracove Type: Thermoplastic Rubber 1/8" (type TP) c/w toe Colour: Burnt Umber B 63 Height: 4" (102mm)	Dark Grey	Applies to Changerooms, Janitor, Universal W/C, First Aid Room, Offices, Vestibules, Meeting Room, Lunch Room
RC1	Resinous Coating	Manufacturer: Stonhard Collection: Stonclad GS Colour: Pewter	Medium Grey	Applies to Tool Room, Electrical, Mechanical, IT Rooms; Wrap up walls 150mm to form cove base
VCT1	Vinyl Composite Tile	Manufacturer: Armstrong Collection: Standard Excelon Imperial Texture Colour: Soft Cool Grey	Light Grey	Applies to Offices, Vestibules, Meeting Room, Lunch Room, Corridors
VCT2	Vinyl Composite Tile	Manufacturer: Armstrong Collection: Standard Excelon Imperial Texture Colour: Sterling	Medium Grey	Applies to Changerooms, First Aid Room, Janitor, Universal W/C
Walls & Paint Finishes				
PT1	Paint	Manufacturer: Benjamin Moore Colour: Chantilly Lace Product Code: 2121-70 Gloss Level: G3 - walls, G1 - ceilings	White	Field, Drywall ceilings, interior walls
PT2	Paint	Manufacturer: Benjamin Moore Colour: Wrought Iron Product Code: 2124-10 Gloss Level: G5	Dark Grey	Door frames and doors, and exposed structure, ducts, services, Interior Walls
PT3	Paint	Manufacturer: Benjamin Moore Colour: Mosaic Product Code: CC-874 Gloss Level: G5	Blue	Interior accent walls
WD1	Cedar Slat Wall		Cedar	Applies to Main Entrance Wall; Refer to Floor Plan and Details
WT1	Wall Tile	Manufacturer: Division9 Collection: Industria Colour: Zinc Size: 2" x 2" (Mosaic) Grout: Mapei, 93 Warm Gray, epoxy	Light Grey	Changerooms, Universal W/C
Millwork				
SS1	Solid Surface	Distributor: Willis Manufacturer: Corian Colour: Everest Size: 20mm thick goods, 4" (102mm) high coved backsplash c/w plywood and steel support framing to suit	White	Lunch Room Counter and backsplash
PL1	Plastic Laminate	Manufacturer: Wilsonart Product: High Pressure Laminate Finish Colour: 8246 Abisko Oak	Oak	Lunch Room Cabinets
Misc				
TS1	Floor Transition Strip	Manufacturer: Schluter Profile: Schiene Finish: Brushed Stainless Steel	SS	Floor transition between VCT1 and VCT 2. Contractor to confirm depth needed for application.
TS2	Wall Transition Strip	Manufacturer: Schluter Profile: Rondec Finish: Brushed Stainless Steel	SS	All outside corners of wall tile, floor to ceiling. Refer to finish plans.
WF1	Window Film	Manufacturer: Decorative Films Product: SXD-1818 Dots Height: As noted on drawings	White	Applies to systems glass partitions at Shared Office, District Manager Office

Part 1 General

1.1 SUMMARY

- .1 Section Includes:
 - .1 Signboards, sign posts, supports, fasteners and installation.
- .2 Related Requirements:
 - .1 Section 03 30 00 – Structural Concrete
 - .2 Section 32 13 13 – Concrete Sidewalks and Curbs

1.2 REFERENCES

- .1 Reference Standards:
 - .1 American Association of State Highway and Transportation Officials (AASHTO):
 - .1 AASHTO LRFDLTS-1, LRFD Specifications for Structural Supports for Highway Signs, Luminaires, and Traffic Signals, 1st Edition, Includes 2022 Interim Revisions
 - .2 American Society for Testing and Materials International (ASTM):
 - .1 ASTM A276/A276M-24, Standard Specification for Stainless Steel Bars and Shapes.
 - .2 ASTM B209/B209M-21a, Standard Specification for Aluminum and Aluminum-Alloy Sheet and Plate.
 - .3 ASTM B210/B210M-19a, Standard Specification for Aluminum and Aluminum-Alloy Drawn Seamless Tubes.
 - .4 Canada Green Building Council (CaGBC):
 - .1 LEED Canada V4 – Building Design and Construction (BD+C).
 - .3 Canadian General Standards Board (CGSB):
 - .1 CGSB 62-GP-11M, Marking Material, Retroreflective, Enclosed Lens, Adhesive Backing. (Withdrawn)
 - .4 Canadian Standards Association (CSA Group):
 - .1 CSA W47.2-11 (R2020), Certification of companies for fusion welding of aluminum, Includes Update No. 1 (2011), Update No. 2 (2012).

1.3 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Provide required submissions in accordance with Section 01 33 00 – Submittal Procedures.
- .2 Submit product data for each type of product specified.
- .3 Submit shop drawings indicating fabrication and installation details for signs and the following:
 - .1 Show sign mounting heights, locations of supplementary supports provided by other sections, and accessories.

- .2 Provide message list, timesteps, graphic elements and layout for each sign.
- .4 LEED Submittals: provide LEED submittals in accordance with Section 01 61 00-LEED Product Requirements.

Part 2 Products

2.1 PERFORMANCE / DESIGN REQUIREMENTS

- .1 Sign supports to be capable of withstanding summation of following loads:
 - .1 Wind load in any direction of 0.32 kPa on signboards.
 - .2 Dead load of signboards, sign supports and appurtenances.
- .2 Structural deflections and vibration in accordance with American Association of State Highway and Transportation Officials (AASHTO), LRFDLTS-1, LRFD Specifications for Structural Supports for Highway Signs, Luminaires, and Traffic Signals.

2.2 METAL SIGN

- .1 Flexible Post
 - .1 Flexible 57 mm diameter tubular, durable, non-colouring thermoplastic with 38 mm diameter reinforcement tube located and secured in the lower portion of the post.
 - .2 Hardware: integral with locking mechanisms.
 - .3 Colour: confirm with Consultant prior to ordering
 - .4 Basis-of-Design Materials:
 - .1 Safe-Hit, Safe-Hit Corporation, Telephone: 800-537-8958.
- .2 Metal Sign Posts
 - .1 Steel Supports for Small Signs: In accordance with ASTM B210/B210M; tubular supports.
 - .2 Base Plates: Ground mounted signage base plates in accordance with ASTM B209/B209M.
 - .3 Anchor and Connecting Bolts: 'U' clamps and miscellaneous hardware for overhead sign installations fabricated from Type 304 stainless steel in accordance with ASTM A276/A276M.
 - .4 Fasteners: Bolts, nuts, washers and other hardware for signs cast aluminum alloy or galvanized steel.
- .3 Signboards
 - .1 Aluminum sheet: In accordance with ASTM B209/B209M, pre-cut to required dimensions; 1.6 mm nominal thickness for signboards up to 750 mm wide; 2.1 mm nominal thickness for signboards 750 to 1200 mm wide.
 - .2 Connecting Straps and Brackets: In accordance with ASTM B209/B209M.

- .3 Silk Screen Ink: Transparent or opaque colours: In accordance with standard traffic signage requirements of Authorities Having Jurisdiction; script content to meet traffic signage regulations of the Authorities Having Jurisdiction.
- .4 Reflective Sheeting and Tape: In accordance with CGSB 62-GP-11M; adhesive, class of reflectivity and colour to meet traffic signage regulations of the Authorities Having Jurisdiction.

2.3 GREEN VEHICLES SIGNAGE

- .1 Green Vehicles Signage. Provide clear, permanently installed signage indicating parking stalls for sole use of green vehicles. Identify vehicles that are eligible to use the designated parking stalls.
- .2 Provide clear, permanently installed signage indicating parking stalls dedicated for the sole use of plug-in electric vehicle charging.
 - .1 Signage shall read as follows:
 - .1 Team to update text as desired, or provide graphic:
 - .2 Reserved for Electric Vehicle Charging Only.
 - .3 Please move vehicle when charging complete.
 - .2 Signage shall be located as indicated on plans.

2.4 FABRICATION

- .1 Supports:
 - .1 Weld support members in accordance with CSA W47.2 with welds of same strength as adjacent member or casting.
 - .2 Remove sharp edges and burrs.
- .2 Signboards:
 - .1 Cut and shape signboard blanks to required shapes and dimensions.
 - .2 Spray signboard back and edges with prime coat and two finish coats in the same colour as the sign face.
 - .3 Spray face with prime coat and two finish coats of required colour for non-reflective signboard faces.
 - .4 Cut and apply reflective background sheeting and lettering in accordance with manufacturer's instructions to match site signage requirements.

Part 3 Execution

3.1 INSTALLATION

- .1 Erect supports to locations indicated on Drawings.
- .2 Erect posts plumb and square to the following installation tolerances:
 - .1 +50 mm from vertical for direct buried supports.

- .2 +12 mm from vertical for signs erected on base plates and separate concrete footings; resting on levelling nuts and restrained with nuts and washers.
- .3 Coat underside of base plates with corrosion protective paint before installation.
- .4 Connect shoe base to shaft with inside and outside fillet welds.
- .5 Close open metal tubes and posts with metal cap to match; cut oblong holes in shoe bases to drain condensation; install bolt cover on each base plate restraining nut.
- .6 Steel Post Installation:
 - .1 Drive to required depth without damaging posts.
 - .2 Drill hole to required depth and set post in sand where rock or concrete is encountered.
 - .3 Backfill with concrete or grout in finished concrete surfaces.
- .7 Signboard Installation:
 - .1 Fasten signboard to supporting posts and brackets.
 - .2 Use T-shape metal stiffeners to join portions of sign panel on site; cover face of T-stiffener with material identical to face of sign panel.

END OF SECTION

Part 1 General

1.1 SUMMARY

- .1 Section Includes:
 - .1 Toilet partitions.
 - .2 Partition screens.
 - .3 Accessories and components such as anchors, hardware, pilasters, fasteners, hinges, latch set, coat hooks, door pulls and privacy closures.
- .2 Related Requirements:
 - .1 Section 05 50 00 – Metal Fabrications
 - .2 Section 06 10 00 – Rough Carpentry
 - .3 Section 06 40 00 – Architectural Woodwork
 - .4 Section 09 21 16 – Gypsum Board Assemblies
 - .5 Section 09 30 13 – Tiling
 - .6 Section 10 28 10 – Toilet and Bath Accessories
 - .7 Section 10 99 99 – Washroom Accessories Schedule

1.2 REFERENCES

- .1 Reference Standards:
 - .1 American Society for Testing and Materials International (ASTM):
 - .1 ASTM A240/A240M-23a, Standard Specification for Chromium and Chromium-Nickel Stainless Steel Plate, Sheet, and Strip for Pressure Vessels and for General Applications.
 - .2 ASTM A480/A480M-23b, Standard Specification for General Requirements for Flat-Rolled Stainless and Heat Resisting Steel Plate, Sheet, and Strip.
 - .3 ASTM A653/A653M-23, Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.
 - .2 Canada Green Building Council (CaGBC):
 - .1 LEED Canada V4 – Building Design and Construction (BD+C).
 - .3 Canadian General Standards Board (CGSB):
 - .1 CAN/CGSB-71.20-M88, Adhesive, Contact, Brushable. (Withdrawn)
 - .4 Canadian Standards Association (CSA Group):
 - .1 CAN/CSA/ASC B651.2-22, Accessible Design for Self-Service Interactive Devices including Automated Banking Machines.
 - .5 Ontario Building Code, Barrier Free Design Section
 - .6 South Coast Air Quality Management District (SCAQMD):
 - .1 SCAQMD Rule 1168-22, Adhesives and Sealants Applications.

1.3 ADMINISTRATIVE REQUIREMENTS

- .1 Pre-Installation Meetings: convene pre-installation meeting one week prior to beginning work of this Section and on-site installation, with contractor's representative and Consultant in accordance with Construction Schedule to:
 - .1 Verify project requirements.
 - .2 Review installation and substrate conditions.
 - .3 Co-ordination with other building subtrades.
 - .4 Review manufacturer's installation instructions.

1.4 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Submit product data in accordance with Section 01 33 00 – Submittal Procedures:
 - .1 Submit manufacturer's printed product literature for toilet partitions or components, specifications and datasheet and include product characteristics, performance criteria, physical size, finish and limitations.
 - .2 Submit Workplace Hazardous Materials Information System WHMIS SDS - Safety Data Sheets. WHMIS SDS acceptable to Labour Canada and Health and Welfare Canada for concrete floor treatment materials. Indicate VOC content. Indicate VOC's:
- .2 Submit shop drawings in accordance with Section 01 33 00 – Submittal Procedures:
 - .1 Indicate fabrication details, plans, elevations, hardware, and installation and backing details.
 - .2 Provide seismic restraint for partitions designed by a Structural Engineer in accordance with Section 01 35 00 – Delegated Design.
- .3 Submit samples in accordance with Section 01 33 00 – Submittal Procedures:
 - .1 Submit duplicate 300 x 300 mm samples of panel showing finish on both sides, two finished edges and core construction.
 - .2 Submit duplicate representative samples of each hardware item, including brackets, fastenings and trim.
- .4 Manufacturer's Instructions:
 - .1 Manufacturer's Instructions: submit manufacturer's installation instructions and special handling criteria, installation sequence and cleaning procedures.
- .5 Manufacturer's Field Reports: submit manufacturer's written reports within three days of review, verifying compliance of Work, as described in PART THREE - FIELD QUALITY CONTROL.
- .6 LEED Submittals: provide LEED submittals in accordance with Section 01 61 01 – LEED Product Requirements.

1.5 CLOSEOUT SUBMITTALS

- .1 Submit closeout data in accordance with Section 01 78 00 – Closeout Submittals:
 - .1 Provide manufacturer's printed recommendations for general maintenance, including cleaning instructions.

1.6 QUALITY ASSURANCE

- .1 Test Reports: certified test reports showing compliance with specified performance characteristics and physical properties.
- .2 Certificates: product certificates signed by manufacturer certifying materials comply with specified performance characteristics and criteria and physical requirements.

1.7 DELIVERY, STORAGE, AND HANDLING

- .1 Deliver, handle and store units in accordance with manufacturer's instructions.
- .2 Store units on raised wood pallets protected from the elements and corrosive materials.
- .3 Do not remove from crates or other protective covering until ready for installation.
- .4 Packaging Waste Management
 - .1 Separate and recycle waste materials in accordance with Section 01 74 19 – Construction Waste Management.

1.8 WARRANTY

- .1 Provide Manufacturers Warranty as follows:
 - .1 Steel Partitions: 15 years against rust.
 - .2 Hardware: 5 years

Part 2 Products

2.1 MANUFACTURERS

- .1 Subject to compliance with the requirements of this Section and Drawings, manufacturers offering products that may be incorporated into the Work include the following:
 - .1 American Specialties Inc./ASI Global Partitions
 - .2 Access SMT
 - .3 Bradley Corporation
 - .4 General Partitions
 - .5 GSS (General Storage Systems).
 - .6 Hadrian Manufacturing Inc.

2.2 MATERIALS

- .1 Toilet Partition Type: Floor mounted, Overhead brace partitions.
- .2 Metal Toilet Partitions: sheet steel bonded to each side of paper honeycomb core with returned and sealed edges.
 - .1 Sheet steel: commercial quality to ASTM A653/A653M with ZF001 (A01) galvanized designation zinc coating.
 - .2 Minimum base steel thickness:
 - .1 Panels and doors: 0.80 mm.

- .2 Pilasters: .0.95 mm with 1.5 mm mounting shoes.
- .3 Reinforcement: 3.0 mm.
- .3 Pilaster support: adjustable bolts with stainless steel collar to ASTM A240/A240M.
- .4 Anchor Hardware: Wall and panel brackets, chrome plated non-ferrous die cast zinc alloy or clear anodized aluminum castings and extrusions. Overhead bracing with anti-grip design.
- .5 Pilaster shoe trim: 0.9 mm thick stainless steel, not less than 75 mm high.
- .6 Exposed fasteners: stainless steel, tamper-proof type.
- .7 Concealed fasteners: stainless steel.
- .8 Provide accessories as required for complete installation.

2.3 COMPONENTS

- .1 Hinges:
 - .1 Heavy duty, non-lubricating.
 - .2 Material/finish: stainless steel casting.
 - .3 Swing: as indicated on drawings
 - .4 Return movement: gravity
 - .5 Adjustable to hold door open at any angle up to 90 degrees
 - .6 Emergency access feature.
- .2 Latch set: built-in, combination latch, door-stop, keeper and bumper, stainless steel, with emergency access feature.
 - .1 Basis-of-Design Materials:
 - .1 Barrier-free lever latch, Hadrian.
- .3 Coat hook: combination hook and rubber door bumper, chrome plated non-ferrous.
- .4 Door pull: Barrier-free type suited for outswinging doors, stainless steel.
- .5 Privacy Closures at Vertical Spaces: Provide manufacturer's standard components to eliminate visible space between doors and pilasters, pilasters and panels, at walls and as follows:
 - .1 Hinge Filler: aluminum.
 - .2 Door Stops: Aluminum.
 - .3 F-channel: galvaneal steel or stainless steel.
 - .4 U-channel: galvaneal steel or stainless steel.

2.4 FABRICATION

- .1 Fabricate standard access stall doors a minimum 610 mm wide inward swinging and barrier free access stall doors a minimum 900 mm clear wide outward swinging or as noted on drawings with stall widths to minimum dimensions indicated on Drawings and in accordance with CAN/CSA/ASC B651 and Current Building Code.

- .2 Provide formed and closed edges for doors, panels and pilasters. Miter and weld corners and grind smooth.
- .3 Provide internal reinforcement at areas of attached hardware and fittings. Temporarily mark location of reinforcement for grab bars.

2.5 SHOP FINISHING

- .1 Clean, degrease and neutralize steel components with phosphate or chromate treatment.
- .2 Apply two (2) coats high solids polyester baking enamel paint, not less than 0.25 mm thickness, to 50% gloss.
- .3 Finish: doors, pilasters, and panels to be the same colour.
- .4 Colours as indicated in Section 10 99 99 - Washroom Accessories Schedule

Part 3 Execution

3.1 EXAMINATION

- .1 Examine site conditions where Work will be applied and ensure acceptability for complete and satisfactory installation. Report unsatisfactory conditions to Consultant.
- .2 Install partitions when unsatisfactory conditions have been corrected.

3.2 PREPARATION

- .1 Ensure supplementary anchorage, if required, is in place.
- .2 Do work in accordance with CAN/CSA/ASC B651.

3.3 INSTALLATION

- .1 Compliance: comply with manufacturer's written recommendations or specifications, including product technical bulletins, handling, storage and installation instructions, and datasheets.
- .2 Install partitions secure, plumb and square.
- .3 Provide and install manufacturer's recommended components for complete privacy of visible spaces between doors and pilasters, pilasters and panels and at walls.
- .4 Anchor mounting brackets to masonry or concrete surfaces using screws and shields: to hollow walls using bolts and toggle type anchors, to steel supports with bolts in threaded holes.
- .5 Attach panel and pilaster to brackets with through type sleeve bolt and nut.
- .6 Provide for adjustment of floor variations with screw jack through steel saddles made integral with pilaster. Conceal floor fixings with stainless steel shoes.
- .7 Equip each door with hinges, latch set, and coat hooks, and as follows:
 - .1 Mount coat hook to door as indicated in Section 10 28 10 – Toilet and Bath Accessories.

- .2 Provide one coat hook at 1650 mm for standard stalls.
- .3 Provide one additional coat hook (two total) at 1200 mm from floor on barrier free door:
 - .1 Adjust and align hardware for easy, proper function.
 - .2 Set door open position at 30° to front. Install door bumper; door mounting.
- .8 Equip outswinging doors with door pulls on inside and outside of door in accordance with CAN/CSA/ASC B651.
- .9 Floor supported and overhead braced partition installation:
 - .1 Attach pilasters to floor with pilaster supports and level, plumb, and tighten installation with levelling device.
 - .2 Secure pilaster shoes in position.
 - .3 Secure headrail to pilaster face with not less than two fasteners per face.
 - .4 Set tops of doors parallel with overhead brace when doors are in closed position.
- .10 Screen installation:
 - .1 Provide urinal stall screens consisting of panel, pilaster and headrail.
 - .2 Anchor screen panels to walls with three panel brackets and vertical upright consisting of tubular headrail stock and end sockets, pilaster complete with floor shoes, anchored to floor.
 - .3 Secure to supplementary anchorage above ceiling finish to receive screen vertical upright.

3.4 FIELD QUALITY CONTROL

- .1 Manufacturer's Field Services:
 - .1 Provide manufacturer's field services consisting of product use recommendations and periodic site visits for inspection of product installation in accordance with manufacturer's instructions.

3.5 CLEANING

- .1 Proceed in accordance with Section 01 74 11 - Cleaning.
- .2 On completion and verification of performance of installation, remove surplus materials, excess materials, rubbish, tools and equipment.

END OF SECTION

Part 1 General

1.1 SUMMARY

- .1 Section Includes:
 - .1 Movable partition system including panels, glazing, partition base, partition head, partition corners, seals, acoustic insulation, components including posts, connections, frames, doors, door hardware, sealants and accessories including battens and batten covers, trims, fasteners, clips, runners or tracks, levelling devices, and other accessories required for the installation as recommended by partition manufacturer.
- .2 Related Requirements:
 - .1 Section 07 92 00 – Sealants
 - .2 Section 08 71 00 – Door Hardware
 - .3 Section 08 80 50 – Glazing
 - .4 Section 08 87 53 – Glazing Films
 - .5 Section 09 21 16 – Gypsum Board Assemblies
 - .6 Section 09 22 00 – Non-Structural Metal Framing
 - .7 Division 26 – Electrical: coordination conduit, wiring, and other materials
 - .8 Division 27 – Communications: coordination communications cabling and other materials.

1.3 ADMINSTRATIVE REQUIREMENTS

- .1 Coordination: Coordinate layout and installation of moveable partition system with other work. Installation of ceilings, floor coverings, lighting fixtures, HVAC equipment and fire suppression systems should be complete before moveable partition system is installed. Coordinate installation of moveable partition system with mechanical, electrical, and communication installation Sections.
- .2 Pre-installation Meeting: Convene pre-installation meetings one week prior to beginning work of this Section to:
 - .1 Verify project requirements.
 - .2 Review installation conditions.
 - .3 Co-ordinate with other building subtrades.
 - .4 Review manufacturer's installation instructions and warranty.

1.4 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Submit product data in accordance with Section 01 33 00 – Submittals.
 - .1 Submit standard construction details, material descriptions, dimensions of individual components and finishes.
- .2 Submit shop drawings in accordance with Section 01 33 00 – Submittals.
 - .1 Indicate elevations, partition modules, materials, components, finishes, door and glazed openings, fastening to adjacent structure, and assembly details.
- .3 Submit samples in accordance with Section 01 33 00 – Submittals.
 - .1 Submit duplicate 200 x 300 mm samples of panel colours, textures and finishes and 300 mm long samples of trim.
 - .2 Submit sample of ceiling fixing device.
- .4 Manufacturer's Field Reports: submit copies of manufacturer's field reports.
- .5 LEED Submittals: provide LEED submittals in accordance with Section 01 61 01 – LEED Product Requirements.

1.5 CLOSEOUT SUBMITTALS

- .1 Submit closeout data in accordance with Section 01 78 00 – Closeout Submittals.
 - .1 Operation and Maintenance Data: Submit manufacturer's written instructions for maintenance of operable components and cleaning procedures, include name of original installer and contact information.

1.6 QUALITY ASSURANCE

- .1 Installer Qualifications: installer to have a minimum of two years documented experience in installing products of similar type and scope and must be approved by the manufacturer.
- .2 Obtain primary products specified in this Section from a single manufacturer.
- .3 Partitions: listed and labelled by an organization accredited by Standards Council of Canada.
- .4 Mock-Ups:
 - .1 Erect full size finished partitioning for one typical enclosed office including the following typical components:
 - .1 Exterior corner.
 - .2 Interior corner.
 - .3 Door frame.
 - .4 Window frame.
 - .5 Chases for installation of wiring and piping.
 - .2 Allow 48 hours for review of mock-up by Consultant before proceeding with work.
 - .3 When accepted, mock-up will demonstrate minimum standard for this work. Mock-up may remain as part of finished work.

1.7 DELIVERY, STORAGE, AND HANDLING

- .1 Deliver moveable wall system components cartoned or crated to provide protection during transit and job storage.
- .2 Inspect moveable wall system components upon delivery for damage. Remove and replace damaged items as directed.
- .3 Store moveable wall system components on raised platforms in vertical positions with blocking between units to allow air circulation. Keep stored material covered and protected from damage.
- .4 Packaging Waste Management
 - .1 Separate and recycle waste materials in accordance with Section 01 74 19 – Construction Waste Management.

1.8 SITE CONDITIONS

- .1 Ambient Conditions:
 - .1 Maintain ambient conditions (temperature, humidity, and ventilation) within limits recommended by manufacturer for optimum results. Do not

install the system components under environmental conditions outside manufacturer's absolute limits.

- .2 Limitations: Do not deliver or install the system components until building is enclosed and finishing operations, including ceiling and floor covering installation and painting, are completed.
- .2 Site Conditions:
 - .1 Site Measurements: Verify dimensions by site measurements before fabrication and indicate measurements on shop drawings where demountable partition system components are indicated to fit between or around other construction; coordinate fabrication schedule with construction progress to avoid delaying the Work.
 - .2 Established Dimensions: Establish dimensions and proceed with fabricating demountable partition system without site measurements where site measurements cannot be made without delaying the Work; coordinate construction to ensure that actual site dimensions correspond to established dimensions; allow for trimming and fitting.

1.9 WARRANTY

- .1 Manufacturer's Warranty: Submit manufacturer's standard ten year warranty starting from the date of Substantial Performance. Manufacturer's warranty is in addition to other rights contained within the Contract Documents.

Part 2 Products

2.1 MANUFACTURERS

- .1 Basis of Design Materials:
 - .1 Altos Portrait System, Teknion.
- .2 Acceptable Manufacturers: Subject to compliance with requirements specified in this Section, and as established by basis-of-design materials, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - .1 DIRT.
 - .2 Dormakaba
 - .3 Falkbuilt Ltd.
 - .4 Haworth.
 - .5 Steelcase.
 - .6 Teknion.

2.2 PERFORMANCE/DESIGN CRITERIA

- .1 Partition system to be fully demountable and relocatable, non-progressive, extend in four directions at posts without disturbing other panels, accommodate floor/ceiling height variations of 25 mm in 3 meters.
- .2 Structural: Partition system shall be structurally stable and vibration free when subjected to impact loads of the type under normal used.
- .3 Seismic Requirements: Ensure appropriate fasteners and anchors and verified by a Professional Engineer, registered in the Province of the work.

- .4 Transverse load capacity: partition shall be able to sustain a 240 Pa minimum transverse loading, with panel deflection no greater than 1/120th of the vertical span when tested in accordance with ASTM E72.
- .5 Vertical Load Capacity: Comply with ANSI/BIFMA X5.6. Functional load capacity of 182 kg per panel to a maximum of 364 kg per 3.65 m wall run and proof load of 182 kg per panel to a maximum of 545 kg per 3.65 m wall run.
- .6 Fire Protection:
 - .1 Major components of system to be non-combustible.
 - .2 Exposed panel surfaces shall meet the following fire hazard classifications requirements in accordance with ULC S102 and ASTM E84:
 - .1 Flame Spread (Class A): 25 maximum.
 - .2 Fuel Contributed: 10 maximum.
 - .3 Smoke Developed: 40 maximum.
 - .3 Testing shall be performed by an independent testing agency approved by the authority having jurisdiction.
- .7 Acoustical: Partition system shall provide the following minimum sound transmission rating when laboratory tested to ASTM E90.
 - .1 Single Glass Wall:
 - .1 STC: 34 minimum.
- .8 If Consultant determines, by testing or other means, that performance of installed partition system has been compromised by:
 - .1 Modification to tested assembly not approved by Consultant, or
 - .2 Defective installation workmanship,take such remedial steps as may be directed by Consultant to improve performance to the specified level, with no increase in Contract Price.
- .9 Compatibility: Partition system shall accommodate the following:
 - .1 Concealed electrical wiring.
 - .2 Electrical Outlets: base mounted.
 - .3 Concealed voice and data communication wiring.
 - .4 Voice and Data Communications Outlets: base mounted.
 - .5 Wall mounted thermostats.
- .10 Partition System Dimensions:
 - .1 Panel Module: as indicated on Drawings.
 - .2 Height: as indicated on Drawings.
 - .3 Site verify dimensions prior to submitting Shop Drawings.

2.3 MATERIALS

- .1 Aluminum extrusions: Aluminum Association alloy AA6063-T54 or 6061-T6 and meeting the requirements of ASTM B429/B429M.
- .2 Steel Components: to ASTM A653/A653M with Z180 zinc coating.

- .3 Clear Tempered Glass: to CAN/CGSB-12.1 and as follows:
 - .1 Thickness: 12 mm thick.
 - .2 Type: Two - Tempered.
 - .3 Class: B - Float Glass.
 - .4 Category: II - 540 J impact resistance.
- .4 Sound/light seal: self adhesive, closed cell, inorganic, permanently elastic, sponge type stripping, 12 x 12 mm size, black.
- .5 Acoustical Insulation: fibreglass insulation as recommended by partition manufacturer to achieve STC rating specified.

2.4 COMPONENTS

- .1 General framing and retaining components: extruded aluminum, metal thickness and configuration to provide rigidity, safe support and fixing of partition system.
- .2 Posts: extruded aluminum, flush type, with plain faces.
- .3 Partition to Ceiling Connections: manufacturer's standard extruded aluminum track, attached to ceiling grid using non-marking clip, lined with closed cell neoprene seal.
- .4 Partition to Floor Connections: manufacturer's standard extruded aluminum channel/base assembly, designed to grip and hold to carpet flooring without damage to floor surface. Fill adjustable space with acoustic insulation.
- .5 Glazing frames: extruded aluminum with concealed glazing stops, of matching metal, for single glazing. Furnish neoprene glazing gaskets for setting glass. Prepare for single and sealed unit glazing.
 - .1 Glazing Tape: 100 percent polybutene vehicle. Extruded in ribbon form with paper separator. Tape shall have an integral shim strip where required.
 - .2 Setting Blocks: Neoprene, shore A" hardness 70-90; shims shore A" hardness 40-50.
 - .3 Glazing Compound: For glazing to metal, to CAN/CGSB-19.2.
- .6 Doors:
 - .1 Tempered glass doors with minimum 2 mm thick extruded aluminum top and bottom rail. Overall door thickness of 44 mm.
- .7 Door Hardware: pivot door configuration using manufacturer's standard attachment hardware and as follows:
 - .1 Tubular Pulls: supplied by moveable partition manufacturer and as indicated on Drawings.
 - .2 Locks: manufacturer's standard and as indicated on Drawings.
 - .3 Acoustics: provide door hardware to meet acoustic rating as required by wall assembly.

- .4 Accessible Hardware: In accordance with Section 08 71 00 – Door Hardware.
- .8 Partition head: extruded aluminum, flush cap.
- .9 Partition base: extruded aluminum.
- .10 External corners: extruded aluminum to match posts.
- .11 Sealants: Silicone, one component - clear, with primers, sealers, cleaners all as specified in Section 07 92 00 - Sealants.
- .12 Accessories: plastic extrusions for batten cover, miscellaneous trim, battens, fasteners, clips, runners or tracks, levelling devices, and other accessories required for the installation as recommended by partition manufacturer.
- .13 Glazing Film: as indicated on Drawings and as specified in Section 08 87 53 – Glazing Films.

2.5 FINISHES

- .1 Finish exposed surfaces of aluminum components in accordance with Aluminum Association Designation System for Aluminum Finishes.
 - .1 Anodized: Exposed aluminum surfaces shall be Aluminum Association (AA) Architectural Class II, AA-M12C22A31, clear anodized.
 - .2 Unexposed aluminum: Mill finish.
- .2 Steel Surfaces: Epoxy powder coated. Colour as selected by Consultant from manufacturer's standard range.
- .3 PVC Components: Colours selected from manufacturer's standard range.
- .4 Slip-on Metal Frames: Clear anodized aluminum.
- .5 Castings for Slip-on Metal Frames: Same as frames.

Part 3 Execution

3.1 ERECTION

- .1 Install system after floor finishes and in accordance with manufacturer's instructions.
- .2 Fasten runners to floors, ceiling and abutting vertical surfaces at 600 mm oc. At ceilings use fasteners that rigidly support partition without damaging or defacing ceiling panels or grid system members.
- .3 Erect partitions plumb, square and level. Accurately fit and fasten to abutting surfaces. Shim under partitions at uneven floors to ensure level installation.
- .4 Install continuous light/sound seal at junction of ceiling height partitions with floors, ceilings and abutting walls and vertical surfaces.
- .5 Provide vertical posts, full height, in one piece.

- .6 Install acoustical insulation and caulking in sound rated partitions to correspond with tested assembly, according to manufacturer's instructions.
- .7 Coordinate partition system installation with work of other trades which are affected. Avoid damage to installed work.
- .8 For rail height partitions, secure posts to floor for lateral stability.
- .9 Install glass and accessories in accordance with GANA Glazing Manual.
- .10 Seal partitions in accordance with Section 07 92 00 - Sealants.
- .11 Apply glazing film as indicated on Drawings and in accordance with Section 08 87 53 – Glazing Films.

3.2 REPAIR

- .1 Remove and replace panels and other components that are damaged, improperly installed, or soiled beyond satisfactory cleaning.

3.3 ADJUSTING

- .1 Correct misalignment of exposed trim.
- .2 Adjust position of door frames for proper door operation.

3.4 FIELD QUALITY CONTROL

- .1 Have manufacturer of products supplied under this Section review Work involved in handling, installation/application, protection and cleaning of its products, and submit written reports in acceptable format to verify compliance of Work with Contract.
- .2 Manufacturer's field services: provide manufacturer's field services consisting of product use recommendations and periodic site visits for inspection of product installation in accordance with manufacturer's instructions.
- .3 Schedule site visits to review Work at stages listed:
 - .1 After delivery and storage of products, and when preparatory Work on which Work of this Section depends is complete, but before installation begins.
 - .2 Twice during progress of Work at 25% and 60% complete.
 - .3 Upon completion of Work, after cleaning is carried out.
- .4 Obtain reports within three days of review and submit.

3.5 CLEANING

- .1 Clean soiled panel and trim surfaces after installation.
- .2 Clean floor, ceiling, and wall surfaces soiled as a result of work of this Section.

END OF SECTION

Part 1 General

1.1 RELATED REQUIREMENTS

- .1 Section 08 80 50 - Glazing: Mirrors.
- .2 Section 10 99 99 – Washroom Accessories Schedule

1.2 REFERENCES

- .1 American Society for Testing and Materials (ASTM):
 - .1 ASTM A153/A153M-16a, Standard Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware.
 - .2 ASTM A240/A240M-20A, Standard Specification for Chromium and Chromium-Nickel Stainless Steel Plate, Sheet, and Strip for Pressure Vessels and for General Applications.
 - .3 ASTM A653/A653M-20, Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.
 - .4 ASTM A666-15, Standard Specification for Annealed or Cold-Worked Austenitic Stainless Steel Sheet, Strip, Plate, and Flat Bar.
 - .5 ASTM A924/A924M-20, Standard Specification for General Requirements for Steel Sheet, Metallic-Coated by the Hot-Dip Process.
 - .6 ASTM A1008/A1008M-21a, Standard Specification for Steel, Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low-Alloy, High Strength Low-Alloy with Improved Formability, Solution Hardened, and Bake Hardenable.
 - .7 ASTM B16/B16M-19, Standard Specifications for Free-Cutting Brass Rod, Bar and Shapes for Use in Screw Machines.
 - .8 ASTM B19-20, Standard Specification for Cartridge Brass Sheet, Strip, Plate, Bar, and Disks.
 - .9 ASTM B456-17, Standard Specification for Electrodeposited Coatings of Copper Plus Nickel Plus Chromium and Nickel Plus Chromium.
 - .10 ASTM C1503 -18, Standard Specification for Silvered Flat Glass Mirror.
- .2 Canadian Standards Association (CSA):
 - .1 CSA-B651-18, Accessible Design for the Built Environment, Includes Errata 1 (2020).
 - .2 CSA-G164-18 Hot Dip Galvanizing of Irregularly Shaped Articles, Includes Update No.1 (2020).
- .3 Canadian General Standards Board (CGSB):
 - .1 CAN/CGSB-1.81-M90, Air Drying and Baking Alkyd Primer for Vehicles and Equipment. (Withdrawn).
 - .2 CAN/CGSB-1.88-92, Gloss Alkyd Enamel, Air Drying and Baking.
 - .3 CGSB 31-GP-107MA, Non-Inhibited Phosphoric Acid Base Metal Conditioner and Rust Remover. (Withdrawn)
- .4 International Code Council (ICC):
 - .1 ICC A117.1-2017, Accessible and Usable Buildings and Facilities.

- .5 Ontario Building Code, Barrier Free Design Section

1.3 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Submit product data in accordance with Section 01 33 00 – Submittal Procedures:
 - .1 Submit manufacturer's printed product literature, specifications and datasheet.
- .2 Submit shop drawings in accordance with Section 01 33 00 – Submittal Procedures:
 - .1 Indicate size and description of components, base material, surface finish inside and out, hardware and locks, attachment devices, description of rough-in-frame, backing, building-in details of anchors for grab bars.
- .3 Submit samples in accordance with Section 01 33 00 – Submittal Procedures:
 - .1 Samples to be returned for inclusion into work.

1.4 CLOSEOUT SUBMITTALS

- .1 Submit closeout data in accordance with Section 01 78 00 – Closeout Submittals:
 - .1 Provide maintenance data for toilet and bath accessories for incorporation into manual specified in Section 01 78 00 - Closeout Submittals.
 - .2 Include list of sources for disposable supplies, replacement parts and service recommendations.

1.5 MAINTENANCE MATERIAL SUBMITTALS

- .1 Extra Materials
 - .1 Provide special tools required for accessing, assembly/disassembly or removal for toilet and bath accessories in accordance with requirements specified in Section 01 78 00 - Closeout Submittals.
 - .2 Deliver special tools to Consultant.

1.6 DELIVERY, STORAGE, AND HANDLING

- .1 Packaging Waste Management
 - .1 Separate and recycle waste materials in accordance with Section 01 74 19 – Construction Waste Management.

1.7 WARRANTY

- .1 Provide manufacturers standard 3 year warranty for all products with extended warranties where they apply.

Part 2 Products

2.1 MANUFACTURERS

- .1 Acceptable Manufacturers: subject to compliance with requirements specified in this Section and as established by the basis-of-design materials, manufacturers

offering products that may be incorporated into the Work include, but are not limited to, the following:

- .1 American Specialties Inc. (ASI)
- .2 Bobrick Washroom Equipment Company.
- .3 Bradley Corporation.
- .4 Frost Products Ltd.

2.2 MATERIALS

- .1 Sheet steel: to ASTM A653/A653M cold rolled, commercial quality, 0.912 mm minimum nominal thickness, with ZF001 designation zinc coating.
- .2 Stainless steel sheet metal: to ASTM A666, Type 304, finish as indicated in component list in 1.519 mm minimum nominal thickness.
- .3 Stainless steel tubing: Type 304, commercial grade, seamless welded, 1.2 mm wall thickness.
- .4 Fasteners: concealed screws and bolts hot dip galvanized after fabrication, tamper and theft resistant exposed fasteners to match material of unit. Expansion shields fibre, lead or rubber as recommended by accessory manufacturer for component and its intended use.
- .5 Provide universal keys for internal access to accessories for servicing and re-supplying. Provide minimum of six keys to Owner's representative.

2.3 COMPONENTS

- .1 Provide components as indicated in Section 10 99 99 – Washroom Accessories Schedule

2.4 FABRICATION

- .1 Weld and grind joints of fabricated components flush and smooth. Use mechanical fasteners only where approved.
- .2 Wherever possible form exposed surfaces from one sheet of stock, free of joints.
- .3 Brake form sheet metal work with 1.5 mm radius bends.
- .4 Form surfaces flat without distortion. Maintain flat surfaces without scratches or dents.
- .5 Back paint components where contact is made with building finishes to prevent electrolysis.
- .6 Hot dip galvanize concealed ferrous metal anchors and fastening devices to CSA G164.
- .7 Shop assemble components and package complete with anchors and fittings.
- .8 Deliver inserts and rough-in frames to job site at appropriate time for building-in. Provide templates, details and instructions for building in anchors and inserts.
- .9 Provide steel anchor plates and components for installation on studding and building framing.

2.5 FINISHES

- .1 Chrome and nickel plating: to ASTM B456, satin finish.
- .2 Baked enamel: condition metal by applying one coat of metal conditioner to CGSB 31-GP-107MA, apply one coat Type 2 primer to CAN/CGSB-1.81 and bake, apply two coats Type 2 enamel to CAN/CGSB-1.88 and bake to hard, durable finish. Sand between final coats. Colour selected from standard range by Consultant.
- .3 Labels: Exposed faces, provide maximum 38 mm diameter stamped manufacturer logo.

Part 3 Execution

3.1 PREPARATION

- .1 Verify wall thickness and construction that will accept recessed accessories.
- .2 Verify that solid blocking for support and anchoring of washroom accessories is installed where required. Confirm exact height and location with Consultant and Manufacturers Instructions.
- .3 Verify that frames and anchors provided, whether by this Section or others, are correctly and securely installed ready to accept the accessory scheduled for the specific location.
- .4 Verify that painting is complete and dry in area of installation before accessories are installed.

3.2 INSTALLATION

- .1 Install accessories at heights to meet barrier free compliance and in coordination with drawings. Confirm heights with Consultant prior to installation.
- .2 Install and secure accessories rigidly in place as follows:
 - .1 Stud walls: install steel back-plate to stud prior to plaster or drywall finish. Provide plate with threaded studs or plugs.
 - .2 Hollow masonry units or existing plaster/drywall: use toggle bolts drilled into cell/wall cavity.
 - .3 Solid masonry, marble, stone or concrete: use bolt with lead expansion sleeve set into drilled hole.
 - .4 Toilet/shower compartments: use male/female through bolts.
- .3 Install grab bars on built-in anchors provided by bar manufacturer.
- .4 Use tamper proof screws/bolts for fasteners.
- .5 Fill units with necessary supplies shortly before final acceptance of building.
- .6 Install mirrors in accordance with Section 08 80 50 - Glazing.

3.3 SCHEDULE

- .1 Locate accessories where indicated on drawings. Exact locations determined by Consultant.

Reissued for Tender May 23, 2025

Part 1 General

1.1 SUMMARY

- .1 Section Includes:
 - .1 Lockers.
 - .2 Benches.
 - .3 Accessories including locking system, coat hooks, end panels, trim and number plates.
- .2 Related Requirements:
 - .1 Section 06 10 00 – Rough Carpentry.
 - .2 Section 10 99 99 – Washroom Accessories Schedule

1.2 REFERENCES

- .1 Reference Standards:
 - .1 American Society of Civil Engineers (ASCE):
 - .1 ASCE 7-22, Minimum Design Loads and Associated Criteria for Buildings and Other Structures, Includes Supplements 1 and 2 (2023).
 - .2 American Society of Testing and Materials International (ASTM):
 - .1 ASTM A653/A653M-23, Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.
 - .2 ASTM A1008/A1008M-23e1, Standard Specification for Steel, Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low-Alloy, High-Strength Low-Alloy with Improved Formability, Solution Hardened, and Bake Hardenable.
 - .3 ASTM B221-21, Standard Specification for Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles, and Tubes.
 - .4 ASTM D4446/D4446M-13, Standard Test Method for Anti-Swelling Effectiveness of Water-Repellent Formulations and Differential Swelling of Untreated Wood When Exposed to Liquid Water Environments (Withdrawn 2022).
 - .3 Canadian General Standard Board (CGSB):
 - .1 CAN/CGSB 1.300-2000, Applied Coating System of Semigloss Baked Finish for Metal Office Furniture. (Withdrawn)
 - .2 CAN/CGSB 44.40-2001, Steel Clothing Locker. (Withdrawn)
 - .4 Canadian Standards Association (CSA Group):
 - .1 CSA G40.20-13/G40-21-13 (R2023), General Requirements for Rolled or Welded Structural Quality Steel/Structural Quality Steel, Includes Update No.1 (2014).
 - .5 Canada Green Building Council (CaGBC):
 - .1 LEED Canada V4 – Building Design and Construction (BD+C).
 - .6 Ontario Building Code, Barrier Free Design Section

1.3 ADMINISTRATIVE REQUIREMENTS

- .1 Coordination:
 - .1 Coordinate size and location of prefabricated metal bases for metal lockers.
 - .2 Coordinate sizes and locations of framing, blocking, furring, reinforcements, and other related work specified in other Sections so that metal lockers can be supported and installed as indicated.

1.4 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Submit shop drawings in accordance with Section 01 33 00 – Submittal Procedures:
 - .1 Indicate the following:
 - .1 Type and class of locker.
 - .2 Thickness of metal.
 - .3 Fabricating and assembly methods.
 - .4 Assembled banks of lockers.
 - .5 Tops, hooks, shelves, bases, trim, and numbers.
 - .6 Filler panels, end/back panels, doors, handles, locking method, and finishes.
 - .7 Indicate seismic bracing and fastening requirements in accordance with ASCE 7 – Minimum Design Loads for Buildings and Other Structures.
 - .2 Submit samples in accordance with Section 01 33 00 – Submittal Procedures:
 - .1 Submit duplicate 50 x 50 mm samples of colour and finish on actual base metal.
 - .3 LEED Submittals: provide LEED submittals in accordance with Section 01 61 01 – LEED Product Requirements.

1.5 CLOSEOUT SUBMITTALS

- .1 Provide operation and maintenance data indicating adjustments, repair methods and replacement of locker doors and latching mechanisms for incorporation into manual specified in Section 01 78 00 - Closeout Submittals.

1.6 QUALITY ASSURANCE

- .1 Installer to be an authorized representative of metal locker manufacturer for installation and maintenance of locker systems for this Project.
- .2 Obtain metal lockers and accessories through one source from a single manufacturer. Do not modify intended aesthetic appearance of metal lockers without the Consultant's written approval; submit comprehensive explanatory data to Consultant for review where modifications are necessary to meet project requirements before submission of Bids.

1.7 DELIVERY, STORAGE, AND HANDLING

- .1 Packaging Waste Management

- .1 Separate and recycle waste materials in accordance with Section 01 74 19 – Construction Waste Management.

1.8 SITE CONDITIONS

- .1 Existing Conditions:
 - .1 Site Measurements: Verify location of concealed framing, blocking, and reinforcements that support metal lockers before they are enclosed, and configuration of recessed openings by Site measurements before fabrication and indicate measurements on Shop Drawings.
 - .2 Established Dimensions: Establish recessed opening dimensions and proceed with fabricating metal lockers without Site measurements where Site measurements cannot be made without delaying the Work. Coordinate wall and floor construction so that actual recessed opening dimensions correspond to established dimensions.

1.9 WARRANTY

- .1 Provide Manufacturers standard 2 year warranty.

Part 2 Products

2.1 MANUFACTURERS

- .1 Acceptable Manufacturers: Subject to compliance with requirements specified in this Section and as established by the Basis-of-Design Materials, manufacturers offering products that may be incorporated into the Work include the following:
 - .1 Access SMT.
 - .2 Canadian Locker Company Limited.
 - .3 General Storage Systems.
 - .4 Hadrian Manufacturing Inc.

2.2 MATERIALS

- .1 Sheet Steel: ASTM A653/A653M coating Designation Z275, commercial grade, stretcher leveled, wiped coat galvanized; to the following minimum base metal thicknesses:
- .2 Steel Plates, Shapes, and Bars: In accordance with CSA G40.20/G40.21, Grade 300W.
- .3 Fasteners: Zinc or nickel plated steel, slotless type exposed bolt heads, and self locking nuts or lock washers for nuts on moving parts.
- .4 Anchors: Select material, type, size, and finish required for secure anchorage to each substrate to seismic requirements in accordance with ASCE 7 and as follows:
 - .1 Provide nonferrous metal or hot dip galvanized anchors and inserts on inside face of exterior walls and elsewhere as required for corrosion resistance.
 - .2 Provide toothed steel expansion sleeves for drilled-in-place anchors.

2.3 MANUFACTURED UNITS

- .1 Lockers: to CAN/CGSB-44.40, Single full-height locker, Class Two - A bank of two or more lockers, freestanding.
 - .1 Size: as indicated in Section 10 99 99 – Washroom Accessories Schedule.
 - .2 Steel Thickness:
 - .1 Body: Side, Divider & Back: 0.61 mm thick
 - .2 Top, & Bottom: 0.76 mm thick
 - .3 Door Inner Face: 0.61 mm thick
 - .4 Door Outer Face: 0.91 mm thick
 - .5 Frame Vertical Components: 1.51 mm thick
 - .6 Frame Horizontal Components: 1.21 mm thick
 - .7 Hinges: 1.90 mm thick
 - .3 Assembly: welded construction.
 - .4 Top: flat
 - .5 Doors: one-piece double-wall envelope construction, steel thickness 0.95 mm (No.20 MSG), door swing left.
 - .6 Door handle: recessed handle steel with bright chromium finish.
 - .7 Door Strike: Continuous
 - .8 Hinges: Minimum three concealed leaf fast pin type hinges, minimum 50 mm long opening 180°; fabricated from 1.519 mm base metal thickness steel securely fastened to door and frame and having non-removable pins.
 - .9 Colours: Body to match doors to be chosen from manufacturer's standard colour range. Colours as indicated in Section 10 99 99 – Washroom Accessories Schedule.
 - .10 Basis-of-Design Materials:
 - .1 Emperor Lockers, Hadrian Manufacturing Inc.

2.4 BENCH

- .1 Bench Seat (BN):
 - .1 Basis-of-Design Materials:
 - .1 As indicated in Section 10 99 99 – Washroom Accessories Schedule.
 - .2 Combined Bench and Locker Base: on-site constructed bench and locker base, hardwood laminate top with clear lacquer finish and pedestals as detailed on Drawings, painted black.

2.5 ACCESSORIES

- .1 Locking system: padlocks supplied by Owner.
- .2 Accessories: Meeting CAN/CGSB-44.40 and as follows:
 - .1 Coat Hooks: Steel with chromium finish.
 - .2 Base: Fabricated bench/base as detailed on Drawings.

- .3 End Panels: Finished end panels to match body panel colour.
- .4 Trim: Steel trim to manufacturer's standard including corner angles, jamb trim and fillers.
- .5 Number Plates: Manufacturers standard plate to match Owner's numbering sequence.
- .3 Finish: Baked enamel or powder coat to match colour listed above.

Part 3 Execution

3.1 EXAMINATION

- .1 Examine walls, floors, and support bases for compliance with requirements for installation tolerances and other conditions affecting performance of work.
- .2 Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

- .1 Assemble and install lockers in accordance with manufacturer's written instructions.
- .2 Securely fasten lockers to grounds and nailing strips.
- .3 Install seismic fastening in accordance with approved shop drawings.
- .4 Install wall trim around recessed locker banks.
- .5 Install filler panels (false fronts) where indicated and where obstructions occur.
- .6 Install finished end and back panels to exposed ends and backs of locker banks.
- .7 Install locker numbers.
- .8 Install bench with fasteners as directed by manufacturer and isolate dissimilar materials if required.

3.3 REPAIR

- .1 Touch up marred finishes or replace metal lockers that cannot be restored to factory finished appearance.

3.4 ADJUSTING

- .1 Clean, lubricate, and adjust hardware.
- .2 Adjust doors and latches to operate easily without binding.
- .3 Verify that integral locking devices operate properly.

3.5 PROTECTION

- .1 Protect metal lockers from damage, abuse, dust, dirt, stain, or paint.
- .2 Do not permit metal locker use during construction.

END OF SECTION

Washroom	Material	Manufacturer & Product	Colour	Remarks
Vanity				
MR-01	Fixed Position Tilt Mirror	Manufacturer: Bobrick Product: B-293 2448; 6mm glass mirror secured to concealed wall hanger with theft-resistant mounting Size: 18" W x 36" H (46 x 91cm) Mounting height: Refer to drawings	S.S.	York Region Design Standard
SP-01	Soap Dispenser	Manufacturer: Swish Product: Proline Soap Dispenser #WHB1LDS Size: 4-3/5"W x 4-9/10"D x 10"H Finish: White Mounting height: Refer to drawings	White	York Region Design Standard
PD-02	Paper Towel Dispenser and Waste Bin	Manufacturer: Frost Product: Recessed - Frost 427-60A Size: 4' - 8.17" x 17.25" x 12.5" (142 x 44 x 61 cm) Mounting height: Refer to drawings	S.S.	York Region Design Standard
Water Closet				
BR-01	Backrest	Manufacturer: Frost Model: Toilet backrest, 1028 Finish: Stainless steel Size: 38.3cm L x 20.3cm D x 10.2cm H (15.1"L x 8"D x 4"H)	S.S.	
CH-01	Coat Hook	Manufacturer: Bobrick Product: Stainless steel clothes hook, B-233	S.S.	
GB-01	Grab Bar	Manufacturer: Frost Product: 1-1/4" diameter 90-degree grab bar, 1003-SP30"x30" Size: 30"L x 30"D x 3.25"H (76.2cm L x 76.2cm D x 8.3cm H) Finish: brushed stainless steel w/ peened grip Mounting height: Refer to drawings	S.S.	York Region Design Standard
GB-02	Grab Bar	Manufacturer: Frost Product: 1-1/4" diameter straight grab bar, 1001-SP24" Size: 24"L x 3"D x 3.25"H (61.0cm L x 7.6cm D x 8.3cm H) Finish: brushed stainless steel w/ peened grip Mounting height: Refer to drawings	S.S.	York Region Design Standard
SD-01	Sanitary Napkin Disposal	Manufacturer: N/A (Provided by York Region Facilities Operations and Maintenance Team) Product: N/A (Provided by York Region Facilities Operations and Maintenance Team) Size: Approximately 19" W x 6" H x 21" D Finish: stainless steel Mounting height: Refer to drawings	S.S.	Owner to supply, contractor to install
TD-01	Toilet Tissue Dispenser	Manufacturer: Swish Product: Tork S6TR #889 DISP T/T JUMBO SIDE/SIDE T22 Size: 19" x 12" x 5.5" (49 x 30 x 14 cm) Finish: Smoke (transparent dark grey)	Smoke (Transparent Dark Grey)	York Region Design Standard
TP-01	Toilet Partition	Manufacturer: Hadrian Product: Headrail braced Standard Series Colour: 609 Colonial Blue	Blue	
UD-01	Urinal Divider	Product: Screen Colour: 609 Colonial Blue Size: 1219mm tall wall mounted Mounting height: Refer to drawings	Blue	
Shower				
SB-01	Shower Base	Manufacturer: MAAX Canada Model: Outlook Base 6036 AcryIX Alcove Shower Base with Center Drain Finish: White Size: 94cm x 150cm x 11.4cm (37" x 60" x 4 1/2")	White	
SB-02	Shower Base	Manufacturer: MAAX Canada Model: B3Round 3636 Acrylic Corner Left or Right Shower Base in White with Center Drain Finish: White Size: 91cm x 91cm x 10cm (35-7/8" x 35-7/8" x 4")	White	
SGB-01	Grab Bar (L-Shaped)	Manufacturer: Frost Product: 30"x40" L-Shaped Grab Bar 1 -1/4" Diameter, 1003-SP Size: 40"L x 30"H (102cm L x 76cm H) Finish: brushed stainless steel w/ peened grip Mounting height: Refer to drawings	S.S.	York Region Design Standard
SGB-02	Grab Bar (Vertical)	Manufacturer: Frost Product: 1-1/4" diameter straight grab bar, 1001-SP36" Size: 36"L x 3"D x 3.25"H (91.4cm L x 7.6cm D x 8.3cm H) Finish: brushed stainless steel w/ peened grip Mounting height: Refer to drawings	S.S.	York Region Design Standard

Washroom	Material	Manufacturer & Product	Colour	Remarks
SGB-03	Grab Bar	Manufacturer: Frost Product: 1-1/4" diameter straight grab bar, 1001-SP24" Size: 24"L x 3"D x 3.25"H (61.0cm L x 7.6cm D x 8.3cm H) Finish: brushed stainless steel w/ peened grip Mounting height: Refer to drawings	S.S.	York Region Design Standard
SBE-01	Folding Bench	Manufacturer: Bobrick Product: B-518 folding shower seat with padded cushion, left-hand seat Size: 21-1/4" W x 32-7/8" L (54 x 83.5cm) Mounting height: Refer to drawings	S.S. with white padding	
Locker				
LO-01	Locker	Manufacturer: Hadrian Product: Emperor Corridor Locker Size: 15" x 18" x 60" Colours: 609 Colonial Blue Mounting: Locker pedestal	Blue	
LO-02	Locker	Manufacturer: Hadrian Product: Emperor Corridor Locker Size: 15" x 18" x 60" Colours: 510 Black Mounting: Locker pedestal	Black	
LO-03	Locker	Manufacturer: Hadrian Product: Emperor Corridor Locker Size: 15" x 18" x 60" Colours: 541 Extra White Mounting: Locker pedestal	White	
BN-01	Bench	Manufacturer: Robinson Steel Company Product: Hardwood Locker Room Bench Top Size: 20" deep x 1.25" thick; length as required per drawings Mounting: Locker pedestal	Mixed Hardwoods	
BN-02	Bench	Manufacturer: Global Industria Product: ADA Locker Room Bench Top, Hardwood Size: 142"W x 20"D x 1-1/4"Thick Mounting: Wall Mount Brackets For 20" Deep ADA Locker Bench Top, Black, Pair Mounting height: Refer to drawings	Hardwood	

Part 1 General

1.1 SUMMARY

- .1 Section Includes:
 - .1 Exterior roof mounted fall arrest and restraint anchors.
- .2 Related Requirements:
 - .1 Section 01 35 00 – Delegated Design
 - .2 Section 05 12 00 – Structural Steel
 - .3 Section 05 31 00 – Steel Deck
 - .4 Section 05 50 00 – Metal Fabrications
 - .5 Section 07 72 33 – Roof Hatch
 - .6 Section 07 92 00 – Sealants

1.2 REFERENCES

- .1 Reference Standards:
 - .1 American Society for Testing and Materials International (ASTM):
 - .1 ASTM A36/A36M-19, Standard Specification for Carbon Structural Steel.
 - .2 ASTM A53/A53M-22, Standard Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless.
 - .3 ASTM A153/A153M-23, Standard Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware.
 - .4 ASTM A276/A276M-24, Standard Specification for Stainless Steel Bars and Shapes.
 - .5 ASTM A484/A484M-24, Standard Specification for General Requirements for Stainless Steel Bars, Billets, and Forgings.
 - .6 ASTM A780/A780M-20, Standard Practice for Repair of Damaged and Uncoated Areas of Hot-Dip Galvanized Coatings.
 - .7 ASTM A999/A999M-23, Standard Specification for General Requirements for Alloy and Stainless Steel Pipe.
 - .8 ASTM A1011/A1011M-23, Standard Specification for Steel, Sheet and Strip, Hot-Rolled, Carbon, Structural, High-Strength Low-Alloy, High-Strength Low-Alloy with Improved Formability, and Ultra High Strength.
 - .9 ASTM B209/B209M-21a, Standard Specification for Aluminum and Aluminum-Alloy Sheet and Plate.
 - .10 ASTM B221-21, Standard Specification for Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles, and Tubes.
 - .11 ASTM C307-18, Standard Test Method for Tensile Strength of Chemical-Resistant Mortar, Grouts, and Monolithic Surfacing.
 - .12 ASTM C579-23, Standard Test Methods for Compressive Strength of Chemical-Resistant Mortars, Grouts, Monolithic Surfacing, and Polymer Concretes.

- .13 ASTM C580-18(2023), Standard Test Method for Flexural Strength and Modulus of Elasticity of Chemical-Resistant Mortars, Grouts, Monolithic Surfacing, and Polymer Concretes.
- .14 ASTM D570-22, Standard Test Method for Water Absorption of Plastics.
- .15 ASTM D1056-20, Standard Specification for Flexible Cellular Materials-Sponge or Expanded Rubber.
- .16 ASTM D2000-18, Standard Classification System for Rubber Products in Automotive Applications.
- .17 ASTM F593-22, Standard Specification for Stainless Steel Bolts, Hex Cap Screws, and Studs.
- .18 ASTM F594-22, Standard Specification for Stainless Steel Nuts.
- .19 ASTM F887-23, Standard Specifications for Personal Climbing Equipment.
- .20 ASTM F3125/F3125M-23, Standard Specification for High Strength Structural Bolts and Assemblies, Steel and Alloy Steel, Heat Treated, Inch Dimensions 120 ksi and 150 ksi Minimum Tensile Strength, and Metric Dimensions 830 MPa and 1040 MPa Minimum Tensile Strength.

1.3 ADMINISTRATIVE REQUIREMENTS

- .1 Coordination: Provide setting diagrams, templates, instructions and directions for installation of components supplied by this Section to other Subcontractors, and necessary for the completion of work of this Section:
 - .1 Coordinate design of anchoring systems and maintenance equipment with the Consultant; provide anchoring and equipment loads acting on supporting structure in accordance with information below so that the primary structural system design can be completed.
 - .2 Coordinate installation of materials of this Section with Roofing Trade Contractor for sealing of membrane to anchors and flashing.
- .2 Pre-installation Meeting: Convene pre-installation meetings prior to beginning work of this Section with Contractor, Consultant, manufacturer's representative, and other components of the Work affected by work of this Section to:
 - .1 Discuss coordination issues, attachment requirements and use of fall restraints during the construction period.
 - .2 Meet a minimum of six weeks prior to beginning work of this Section, so that coordination issues affecting work of this section, or other Trade Contractors can be accounted for and corrected prior to any installation of materials.

1.4 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Submit design calculations and anchor loadings to the Consultant within ten days of award of this contract, so that primary structural support system design can be completed.
- .2 LEED Submittals: provide LEED submittals in accordance with Section 01 61 00-LEED Product Requirements.

- .3 Provide required information in accordance with Section 01 33 00 – Submittal Procedures, and as follows:
 - .1 Provide product data for each type of product specified.
 - .2 Provide Work Plan Drawings showing individual primary suspension line and safety life line anchors used for support of exterior maintenance equipment and personnel.
 - .3 Provide shop drawings using CISC standard drafting practices; detailing fabrication of steel components including, but not limited to, the following:
 - .1 Indicate complete layout and configuration of system, locations, and all other components and accessories.
 - .2 Indicate design, fabrication details, plans, elevations, hardware and installation details, including details of cuts, connections, splices, camber, holes, and other pertinent data.
 - .3 Show interface with adjacent materials.
 - .4 Show locations of maintenance equipment and fall arrest anchors, configurations, dimensions, attachment details, and components required for complete system complying with provisions of this Section.
 - .5 Indicate methods of attachment to building structure.
 - .6 Indicate welds using CWB symbols, distinguishing between shop and field welds, and show size, length, and type of each weld.
 - .7 Type, size, and length of bolts, distinguishing between shop and field bolts; high strength bolted slip critical, direct tension, or tensioned shear/bearing connections.
 - .8 Shop drawings shall be signed and sealed by a professional engineer qualified in the province of the Work, and who was responsible for their preparation.
 - .9 Shop drawings shall include restrictive and non-restrictive working usage notes and general safety requirements.
 - .4 Provide setting diagrams, templates, instructions and directions for installation of components supplied by this Section to other Subcontractors, and necessary for the completion of work of this Section.
- .4 Submit Letters of Commitment and Compliance using sample formats contained in Section 01 35 00 – Delegated Design, and as follows:
 - .1 At the onset of work of this Section and prior to shop drawing submission, prepare and submit a Letter of Commitment, including a summary of the work covered by this Section.
 - .2 On completion of work of this Section, prepare and submit a Letter of Compliance, including a summary of the work covered by this Section.
 - .3 Commitment and compliance letters referred to above must cover all structural aspects of fall arrest and restraint anchors, equipment anchors, design of connections and erection, and as follows:
 - .1 Certifying that the anchors, layout, and installation meet or exceed the performance requirements of the Authorities Having Jurisdiction, and the requirements of the Ontario Occupational Health and Safety Regulation.

- .2 Certifying that system is engineered and designed to suit the requirements of the roof deck, roofing type, and location to accommodate structural requirements and to maintain watertight seal.
- .5 Submit a Current Letter of Validation; and in addition, submit copies of the following CWB documents:
 - .1 Company specific Welding Supervisor's Certificate, backside and front side indicating proper certification.
 - .2 Individual Welder Certificate with listing for type of work being performed.
- .6 Submit test data from a qualified testing laboratory indicating that anchors have been load tested after installation and prior to use in accordance with CSA Z271 to 360°, and to absolute failure (fracture).
- .7 Submit reduced plastic laminated as-built roof plan drawing indicating layout and location of anchors and tie-offs, and safe works and usage requirements that will be posted near roof access points in sufficient quantities for each access point to the roof or equipment access locations.
- .8 Submit the following for inclusion in operations and maintenance manuals:
 - .1 Special procedures, and conditions requiring maintenance during the operational stage for materials specified in this Section.
 - .2 Safety Inspection Log Books required for yearly inspections.
 - .3 Provide on-site orientation and demonstration to Owner's key personnel, and suggestions for incorporating safe work practices into the Owner's Safe Work Practices Policy.
 - .4 List of accessory equipment, product data, and samples that can be used with the installed anchoring system; submittal does not imply purchase by Owner.

1.5 CLOSEOUT SUBMITTALS

- .1 Provide operations and maintenance materials in accordance with Section 01 78 00 – Closeout Submittals.

1.6 QUALITY ASSURANCE

- .1 Regulatory Requirements:
 - .1 Conform with current local Occupational Health and Safety Regulations (OH & S), Fall Protection, Loading Requirements for Anchoring Systems.
 - .2 Conform with additional requirements of CSA Z91 and CSA Z259 Series for standards relating to requirements of this Section, except where in conflict with current local OH&S Regulations.
- .2 Manufacturer shall be a company specializing in the design and installation of permanent safety tie-back and life line anchor, horizontal life line systems, and exterior maintenance and window washing equipment systems having a minimum of five years of experience.

- .3 Manufacturer shall provide \$5,000,000.00 of specific product liability insurance for all aspects of their installation, design, and failure of the safety anchors and their installation.
- .4 Manufacturers shall comply with applicable CWB standards for classification of work being performed including, but not limited to, the following:
 - .1 Welding inspection: to CSA W178.
 - .2 Resistance welding: to CSA W55.3.
 - .3 Fusion welding: to CSA W59.
 - .4 Welding qualifications: to CSA W47.1
- .5 Installing Subcontractors, if different than fabricator, shall have completed welding work similar in material, design, and extent to that indicated for this Project; with a record of successful in service performance; having welders certified by CWB for classification of work being performed; and having the same certifications as required by CSA and CWB for the fabricator and manufacturer.

1.7 DELIVERY, STORAGE, AND HANDLING

- .1 Deliver materials on pallets with manufacturer ' s original protective packaging and identifying labels intact.
- .2 Store products in an area protected from construction activities.
- .3 Packaging Waste Management.
 - .1 Separate and recycle waste materials in accordance with Section 01 74 21 - Waste Management and Disposal.

Part 2 Products

2.1 MANUFACTURERS

- .1 Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - .1 Atlas Anchor Systems (B.C.) Ltd.
 - .2 Innovative Fall Protection.
 - .3 Pro-Bel Enterprises Ltd.
 - .4 Safeguard Industries.
 - .5 Thaler Metal Industries Ltd.
- .2 Manufacturers meeting or exceeding the requirements of this section may apply to the Consultant prior to submission of bids for inclusion in the acceptable materials listing.

2.2 DELEGATED DESIGN REQUIREMENTS

- .1 Engineer and design a building maintenance system, fall protection and fall restraint systems sufficient for gaining access to exterior and interior vertical building surfaces that meets the requirements of the Ontario Occupational Health and Safety Act using a professional engineer registered in the province of the work, and as follows:

- .1 Fall Arrest and Fall Restraint System: Roof top maintenance system permitting free movement of persons over roof areas as required by CSA Z91 and ANSI Z359.1, and other standards referenced in above; where differences occur, the more restrictive requirement shall prevail.
- .2 Upright Anchors: As instructed by manufacturer in layout and design acceptable to Consultant.
- .3 Free Fall Distance: Limit maximum free fall vertical distance of 1220 mm with a fixed lanyard and 1980 mm with energy absorbing lanyard.
- .4 Travel Restraint Systems: Design for up to four persons on roof and having an ultimate load capacity of a minimum 22.2 kN in any direction that a load may be applied.
- .5 Fall Arrest System: Design for one person, without shock absorber and capable of supporting a minimum of 22.2 kN per worker attached.
- .6 Vertical Lifeline Systems: Design for a permanent one person vertical lifeline where it is required as a part of a ladder safety device; base design on specific load requirements for this Project.
- .7 Horizontal Lifeline Systems: Design for a permanent horizontal cable lifeline system; base design on specific load requirements for this Project.
- .8 Design structural connections to roof deck and additional reinforcement as required to prevent damage to roof deck; submit load requirements to the Consultant for their use in design the primary structures.
- .9 Design connections to supporting structural framing as required to resist pullout force and reinforce deck against damage and carry pull out force back to structural framing; submit load requirements to the Consultant for their use in design the primary structures.
- .10 Arrest Force: Limit to 4 kN or less.
- .11 Design an adequate fall protection system that will be suitable for the building structure, to comply with the relevant codes and regulations of the jurisdictional authorities. Provide the appropriate number of anchorage connectors as required by jurisdictional authorities to suit particular manufacturer's product.
 - .1 Fall arrest anchorage connectors designed:
 - .1 to a maximum force of 8.0 kN when wearing a body harness.
 - .2 capable of resisting in situ test load of 11.1 kN without any permanent deformation.
 - .3 to 22.2 kN against fracture of detachment.
 - .2 Delegated design engineer shall design and verify the installed system, any modification or additional anchor requirements, devices, and equipment required to complete the window cleaning and building maintenance system, and shall include costs in the contract price.

2.3 MATERIALS AND EQUIPMENT

- .1 Materials shall be new, free from defects impairing strength, durability or appearance, and of best commercial quality for purposes specified.

- .2 Equipment shall include all components, connections, devices, and controls required to make it fully and safely operable.
- .3 Fall Arrest Anchorage connectors:
 - .1 Fall arrest anchorage connectors shall be devices for support of safety lifeline. Fall arrest anchorage connectors shall be roof or wall mounted, designed by professional engineer in the province of work, in accordance with requirements of CSA Z259.
 - .2 Fall arrest anchorage connectors shall be capable without fracture and/or pull-out a force of 22.2 kN, applied in any direction.

2.4 STEEL PLATE AND UPRIGHT MATERIALS

- .1 Exposed Structural Units: Stainless steel, Type 304, 290 MPa, yield strength.
- .2 Single Insert: Cast stainless steel, Type 304.
- .3 Steel Pipe for Upright Anchors: ASTM A53/A53M Schedule 40, Type S, Grade A or B to suit strength requirements, galvanized for exposed locations, black for protected locations, heavy wall construction.
- .4 Steel Plate: ASTM A1011/A1011M Grade 45, minimum 10 mm thick.
- .5 Steel D-Ring Eyelets, Attachment Rings, and Other Hardware: In accordance with ASTM F887; drop forged, 22.2 kN proof load, 10 mm x 50 mm steel.
- .6 Safety Spirals and Pass-thru Brackets: Type 304 stainless steel with yield strength of 35 Ksi.
- .7 Hollow steel section (HSS) piers: mild steel, Type 300W with yield strength of 50 Ksi. Wall thickness to suit application, hot dipped galvanized to CSA G164.
- .8 Base plates and all other sections: galvanized mild steel as above with yield strength of 44 Ksi. Thickness and securement to suit application.
- .9 Welding Materials: in accordance with CSA W59.

2.5 FASTENERS

- .1 Non-Exposed Structural Components: ASTM A36/A36M or CSA G40.20/G40.21, Type 360W, mild steel, 350 MPa yield strength for high strength steel and 300 MPa for plate and other shapes; galvanized to the requirements of CSA G164.
- .2 Exposed Non-Structural Items: Seamless spun 6061-T6 aluminum alloy and temper, conforming to ASTM B221/B221M and ASTM B209/B209M.
- .3 Cold Rolled Non-Exposed Structural Steel Sections: CSA S136, 380 MPa yield strength, 460 MPa tensile strength.
- .4 Bolts, Nuts, and Washers: In accordance with ASTM F3125/F3125M or hot-dip galvanized in accordance with ASTM A153/A153M, Class C or D, as appropriate to installation.
- .5 Exposed Fasteners: Stainless steel Type 304, engineered by manufacturer for design loads and type of use; gasket with EPDM washers where penetrating roofing membrane.

- .6 Structural Thermal Break: High strength polyurethane closed cell sheet, 50 mm thick with R-value of 3.1 per 25 mm.
 - .1 Basis-of-Design Materials:
 - .1 Armatherm 500, Armadillo Structural Connections
- .7 Epoxy Adhesive System: Two component, injectable adhesive specifically manufactured for use in installing dowels or threaded anchor rods and inserts into new or existing concrete, and as follows:
 - .1 Base Composition: Solid base installation.
 - .2 Epoxy Composition: Sealed packaging containing resin, hardener, cement and water; components providing the following properties:
 - .1 Compressive Strength ASTM C579: 71.8 MPa
 - .2 Tensile Strength ASTM C307: 15.9 MPa
 - .3 Flexural Strength ASTM C580: 29.3 MPa
 - .4 Modulus of Elasticity ASTM C307: 7032 MPa
 - .5 Water Absorption ASTM D570: 0.12%
 - .6 Curing Time: Rapid set, high strength and stiffness; maximum time 45 minutes at 20°C.

2.6 FLASHING AND SEALING MATERIALS

- .1 Non-expanding Sealing Gaskets for Sealing under Anchor Bases: Pre-cut and predrilled, 40 durometer, 3 mm thick solid neoprene rubber meeting or exceeding ASTM D2000.
- .2 Expanding Compression Gaskets for Sealing under Steel Flashing Cap: 6 mm neoprene rubber meeting or exceeding ASTM D1056 Type I (Closed Cell), Class B or C (Petroleum Resistant).
- .3 Steel Flashing Cap: Minimum 0.45 mm metal core thickness, prefinished sheet steel; having boxed corners fit tightly over plate and compression gasket, with factory cut penetration configured to upright, and predrilled holes at corners for attachment with mechanical fasteners.
- .4 Joint Sealants: Non-skinning butyl sealant where not exposed to ultra-violet or neutral curing silicone sealant where exposed and as applicable to installation. Polyurethane sealant not accepted for this type of installation.
- .5 Rigid Foam: Watertight closures or closed cell foam, forming a part of the manufacturer's standard materials for filling pipes to prevent water infiltration.

2.7 FABRICATION

- .1 Accurately cut, machine and fit joints, corners, copes and mitres so that junctions between components fit together tightly and in true planes. Cap open ends of sections exposed to view.
- .2 Fabricate work with materials and component sizes, metal gauges, reinforcing, anchorage connectors, and fastenings of adequate strength to ensure that it will remain free of warping, buckling, opening of joints and seams, and distortion within limits of intended and specified use and with allowable design factors imposed by authorities having jurisdiction.

- .3 Connections: Weld and grind smooth in accordance with CWB requirements.
- .4 Pre-drill holes for fasteners at base plates.
- .5 Fabricate engineered window washing/fall restraint and fall arrest system suitable for roof and deck mounting with welded steel base plate and steel plate uprights or steel pipe uprights.
- .6 Provide drilled eye holes at steel plate uprights or D-rings at uprights suitable for attachment of catenary life lines.
- .7 Fill steel pipe uprights with urethane foam insulation or other accepted filler.
- .8 Size uprights for a minimum 200 mm exposure above roof membrane in accordance with OIRCA good roofing practices.
- .9 Fabricate seamless flashings where metal pier anchors are to be used.
- .10 Seal top of anchors with a one piece stainless steel cap.

2.8 FINISHES

- .1 Shop Preparation and Shop Primer: Track, supports, and other structural components: SSPC-SP6 ready for application of CAN/CGSB 1.40, anticorrosive primer.
- .2 Anchors Fabricated from Steel Pipe Uprights, Base Plates, and D-rings:
 - .1 Mild Steel Components: Hot-dip galvanize after fabrication, as follows:
 - .1 Pipe: ASTM A53/A53M.
 - .2 Plate: CSA G164.
 - .3 D-Rings: CSA G164 or ASTM A153/A153M.
 - .2 Stainless Steel Components: Manufacturer's standard.
- .3 Galvanizing Repair Compound: 95% zinc cold galvanizing compound in accordance with ASTM A780; field touch-up damaged galvanizing surface finishes with galvanizing repair compound.

Part 3 Execution

3.1 EXAMINATION

- .1 Verify conditions as satisfactory to receive work of this Section.
- .2 Beginning work constitutes acceptance of existing conditions.
- .3 Verify layout of roof fall arrest anchors and that structural connections are suitable for work of this Section.

3.2 PREPARATION

- .1 Supervise and assist in setting of anchorage devices required for installation of work of this Section, but which do not form a part of the work of this Section.
- .2 Protect all adjacent surfaces from damage due to work under this section.

3.3 INSTALLATION

- .1 Install building maintenance system and safety anchors in accordance with manufacturer's written instructions and provisions of the Contract Documents, under the supervision of structural engineer employed by manufacturer registered in the province of the work.
- .2 The manufacturer's engineer shall coordinate their activities with, and notify the Consultant where conflicts arise, or where site conditions require a modification to the engineered design indicated on the shop drawings.
- .3 Lay out building maintenance system and safety anchors in accordance with reviewed shop drawings.
- .4 Space materials symmetrically between roof elements such as ridges and sidewalls.
- .5 Space uprights at same spacing so that same line can be attached at different locations.
- .6 Coordinate fall arrest anchorage connector heights with building roof systems and locations with roof mounted equipment.
- .7 Coordinate installation with Roofing Contractor for sealing of membrane to anchorage connectors and flashing.
- .8 Install work to meet manufacturer's specifications, true, tightly fitted, and level or flush to adjacent surfaces, as applicable for the installation.

3.4 FIELD QUALITY CONTROL

- .1 Provide field review by manufacturer as follows:
 - .1 Provide field inspection and testing upon completion by manufacturer's technical representative.
 - .2 Note deficiencies and promptly make written report to Contractor, Owner and Consultant.
 - .3 Issue Letter of Compliance and certifications of system issued by a qualified professional engineer registered in the province of the Work.
 - .4 Complete inspection log book to certify the system for use; turn over to Owner's representative.
- .2 The Owner will require a complete commissioning of the fall arrest and restraint system, and window washing and equipment supports in accordance with the Owners commissioning plan.
- .3 Testing: provide third party on site load testing in accordance with item 11.3.3 in CSA Z271:20 and provide results to the Owner within ten days.

3.5 ADJUSTING

- .1 Verify work under this section that installed products function properly and adjust them to ensure proper operation.
- .2 Repair or replace defective installations not conforming with provisions of Contract Documents.

3.6 TRAINING

- .1 Train Owner's personnel in the use of the system.

3.7 CLEANING

- .1 Upon completion of installation, remove surplus materials, rubbish, and tools.

END OF SECTION

Part 1 General

1.1 SUMMARY

- .1 Section Includes:
 - .1 Microwave.
 - .2 Fridge.
 - .3 Installation.
- .2 Related Requirements:
 - .1 Section 06 40 00 – Architectural Woodwork
 - .2 Section 09 21 16 – Gypsum Board Assemblies
 - .3 Division 22 – Plumbing: Coordination of pipes and fittings and other materials.
 - .4 Division 23 – Heating, Ventilating and Air Conditioning (HVAC): Coordination of ventilation, ducts and other materials.
 - .5 Division 26 – Electrical: Coordination conduit, wiring and other materials.

1.2 REFERENCES

- .1 Reference Standards:
 - .1 American Society for Testing and Materials International (ASTM):
 - .1 ASTM A240/A240M-23a, Standard Specification for Chromium and Chromium-Nickel Stainless Steel Plate, Sheet, and Strip for Pressure Vessels and for General Applications
 - .2 Canada Green Building Council (CaGBC):
 - .1 LEED Canada V4 – Building Design and Construction (BD+C).
 - .3 Canadian Standards Association (CSA Group):
 - .1 CSA C22.2 No.120-13 (R2023), Refrigeration Equipment.
 - .2 CSA C22.2 No.150-16 (R2021), Microwave Ovens, Includes Errata (2017) and Update No. 1 (2022) and Update No.2 (2023).
 - .3 CAN/CSA C338-15 (R2020), Energy performance and capacity measurement of household microwave ovens.

1.3 ACTION SUBMITTALS / INFORMATION SUBMITTALS

- .1 Submit product data in accordance with Section 01 33 00 – Submittal Procedures:
 - .1 Include manufacturers name, type, model, year, dimensions, capacity and finishes for each appliance.
 - .2 Include details of operation, servicing, maintenance and recommended spare parts list.
- .2 Submit shop drawings in accordance with Section 01 33 00 – Submittal Procedures, indicate:
 - .1 Construction details of equipment by drawings.
 - .2 Roughing in requirements for mechanical and electrical services.
 - .3 Installation details

- .3 LEED Submittals: provide LEED submittals in accordance with Section 01 61 01-LEED Product Requirements.

1.4 CLOSEOUT SUBMITTALS

- .1 Provide operations and maintenance materials in accordance with Section 01 78 00 – Closeout Submittals.

1.5 QUALITY ASSURANCE

- .1 Obtain products from a qualified manufacturer having a service centre capable of providing training, parts, and emergency maintenance repairs within 50 km of project site.
- .2 Appliances shall be labelled in accordance with requirements of CSA, ULC, CGA and other standards acceptable to the Authorities Having Jurisdiction.
- .3 Provide appliances that carry labels indicating energy cost analysis (estimated annual operating costs) and efficiency information qualifying for labelling under the Energy Star Program.

1.6 WARRANTY

- .1 Provide manufacturer's standard form of warranty stating that each appliance specified will be repaired or replaced that fail in materials or workmanship within manufacturers standard warranty period.

Part 2 Products

2.1 MANUFACTURERS

- .1 Materials other than named products Basis-of-Design materials may be acceptable to the Consultant; submit information in accordance with Section 01 62 00 – Product Options and Substitutions and as follows:
 - .1 Proposed alternates shall match colour range and performance characteristics of named products.
 - .2 Proposed alternates found acceptable by Consultant will be listed in an Addendum.
 - .3 The Consultant is not obliged to accept any materials presented for their review and does not need to provide reasons for rejection of proposed alternates.

2.2 COOKING APPLIANCES

- .1 Microwave:
 - .1 Capacity: 0.02 m³.
 - .2 Finish: Stainless steel.
 - .3 Features: Digital control panel with timer display.
 - .4 Power: 1000 W
 - .5 Size: 514 mm wide x 305 mm high x 419 mm deep.
 - .6 Basis-of-Design Materials:
 - .1 NE1054F, Panasonic.

2.3 REFRIGERATION APPLIANCES

- .1 Refrigerator/Freezer:
 - .1 Type: Freestanding, frost-free one door refrigerator with freezer on top.
 - .2 Dimensions: 1520 mm high x 610 mm wide x 727 mm deep.
 - .3 Storage Capacity: 0.33 cu. metre
 - .1 Fridge Storage: Two sliding glass shelves, one fixed glass shelf, fixed full width door rack, adjustable half width door rack, two adjustable can racks, two clear crispers.
 - .2 Freezer storage: Two fixed full width freezer door racks, full width freezer shelf.
 - .4 Temperature Controls: Separate temperature controls for each compartment, and with switch for condensation control heating element at freezer opening.
 - .5 Front Panel: Manufacturer's standard panels, Black.
 - .6 Basis-of-Design Materials:
 - .1 GPE12FGKBB, GE Appliances

Part 3 Execution

3.1 EXAMINATION

- .1 Examine conditions for compliance with requirements for installation tolerances and other conditions affecting performance of work.
- .2 Examine roughing in for piping and electrical systems to verify actual locations of piping and electrical connections before equipment installation.
- .3 Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

- .1 Install equipment in accordance with manufacturer's instructions.
- .2 Coordinate connection of mechanical and electrical services.
- .3 Securely anchor built-in units to supporting cabinets or countertops with concealed fasteners; verify that clearances are adequate for proper functioning and rough openings are completely concealed.
- .4 Place free-standing units in final locations after finishes have been completed in each area; verify that clearances are adequate to properly operate equipment.
- .5 Adjust equipment for smooth and proper operation.

3.3 SITE QUALITY CONTROL

- .1 Test each appliance specified in this Section to verify proper operation; make necessary adjustments.
- .2 Verify that accessories required have been furnished and installed.

3.4 CLEANING

- .1 Remove packing material from appliances and leave units in clean condition, ready for operation.

3.5 DEMONSTRATION

- .1 Engage a factory authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain appliances.

END OF SECTION

Part 1 General

1.1 SUMMARY

- .1 Work of this section includes provision of manufactured metal shelving.

1.2 SUBMITTALS

- .1 Provide submittals in accordance with Section 01 33 00 - Submittal Procedures.
 - .1 Submit manufacturer's printed product literature, specifications and data sheets. Include manufacture's installation and assembly instructions.
 - .2 Submit shop drawings: Show plan layout of shelving.
- .2 Submit closeout data in accordance with Section 01 78 00:
 - .1 Submit maintenance data: Include maintenance procedures, recommendations for maintenance materials and equipment.

1.3 QUALITY ASSURANCE

- .1 Qualifications: Provide proof of qualifications when requested by Consultant:
 - .1 Manufacturer: Obtain products listed in this Section from listed manufacturers with 10 years experience fabricating library metal shelving and that have local distribution and servicing facilities.
 - .2 Installers: Use installers that have completed manufacturer's authorized training program and that are certified to install and maintain units delivered for this Project.
- .2 Source Limitations: Obtain products through one source from a single manufacturer.

1.4 DELIVERY, STORAGE, AND HANDLING

- .1 Deliver, handle, store and protect materials in accordance with Section 01 61 00 – Common Product Requirements.
- .2 Sequence delivery of materials to take into account other contractors that may still be working on site.
- .3 Storage on site for materials will be limited to the immediate area of the Work:
 - .1 There will be no additional site storage available.
 - .2 Arrange and pay for any off site storage costs arising from bulk delivery of materials.
- .4 Schedule “Just-In-Time” delivery of materials to site and store materials in area of work:
 - .1 No other storage facilities are available on site.
 - .2 Be responsible for obtaining any required off-site storage required for materials of this project.

- .3 Schedule deliveries to avoid double movements of materials on site.
- .4 Cooperate with other contractors and schedule delivery of materials to allow for other contractors activities.
- .5 Storage and Protection:
 - .1 Protect products from scratches, handling marks and other damage.

1.5 WARRANTY

- .1 Provide manufacturer's warranty for a period of ten (10) years from the date of Substantial Performance of the Work.

Part 2 Products

2.1 PRODUCT:

- .1 Metal shelving (1 required) including:
 - .1 Shelf: three - galvanized steel mesh with 50 x 100 mm grid
 - .2 Adjustable: 50 mm increments for shelving
 - .3 Weight: each shelf holds up to 1360 kg
 - .4 Finish: powder coating
 - .5 Posts and supports: 1.63 mm (14 ga)
 - .6 Size: 1220 mm wide x 915 mm deep x 1828 mm tall
 - .7 Basis of Design:
 - .1 H-5415, U-Line Bulk Storage Racks
- .2 Metal shelving (2 required) including:
 - .1 Shelf: three - galvanized steel mesh with 50 x 100 mm grid
 - .2 Adjustable: 50 mm increments for shelving
 - .3 Weight: each shelf holds up to 1247 kg
 - .4 Finish: powder coating
 - .5 Posts and supports: 1.63 mm (14 ga)
 - .6 Size: 1828 mm wide x 915 mm deep x 1828 mm tall
 - .7 Basis of Design:
 - .1 H-4320, U-Line Bulk Storage Racks

2.2 FINISH

- .1 Electrostatically applied powder coat finish.

Part 3 Execution

3.1 EXAMINATION

- .1 Examine subfloor surfaces, for compliance with requirements for installation tolerances of fixed storage units.
- .2 Proceed with installation only after unsatisfactory conditions have been corrected

3.2 INSTALLATION

- .1 Install components and accessories after painting and finishes have been completed.
- .2 Install shelving units to comply with final layout drawings, in accordance with manufacturer's printed instructions and structural calculations.
- .3 Position unit's level and plumb.
- .4 Install wood panels to tops and ends.

3.3 CLEANING AND PROTECTION

- .1 Clear components and surfaces, remove surplus materials resulting from installation upon completion of work and leave areas of installation in clean condition.
- .2 Protect system against damage during remainder of construction period. Advise Owner of additional protection required to ensure shelving units will be without damage or deterioration at time of Substantial Performance of the Work.

3.4 DEMONSTRATION AND TRAINING

- .1 Provide complete training to end-user's staff. Training shall include general safety and operation instructions, and basic preventative maintenance procedures.

PART 1 - GENERAL

1.01 GENERAL REQUIREMENTS

- .1 Comply with requirements of the Owner's General Requirements and all documents referred to therein.

1.02 DEFINITIONS AND TERMS

- .1 The following Definitions and Terms shall be read in conjunction with the Definitions included in the Division 01 Specifications and all Mechanical Division Contract Documents.
 - .1 **barrier-free:** means when applied to a building and its facilities, that building and its facilities can be approached, entered and used by persons with physical or sensory disabilities in accordance with requirements of local governing building code.
 - .2 **concealed:** means hidden from normal sight in furred spaces, shafts, ceiling spaces, walls and partitions.
 - .3 **delete** or **remove:** includes tenses of "delete" or "removed" means to disconnect, make safe, remove obsolete materials including any back box and exposed piping and raceways; patch, and repair/finish surfaces to match adjoining similar construction; include for associated re-programming of systems and/or change of documentation identifications to suit deletions; and properly dispose of deleted products off site unless otherwise instructed by Consultant.
 - .4 **exposed:** means work normally visible, including work in equipment rooms, tunnels, and similar spaces.
 - .5 **finished:** means when in description of any area or part of an area or a product which receives a finish such as paint or in case of a product may be factory finished.
 - .6 **OSHA** and **OHSA:** stands for Occupational Safety and Health Administration and Occupational Health and Safety Act respectively, and wherever either one is used, they are to be read to mean local governing occupational health and safety regulations that apply to and govern work and to which work must adhere, regardless if Project falls within either authority's jurisdiction.
 - .7 **Work:** includes tenses of "work" when used in the Mechanical Division Documents it means all equipment, permits, materials, labour and other services as may be necessary for a complete Mechanical system as described in the Mechanical Division Documents.
 - .8 **Documents:** Include one or more combinations of Mechanical Division Drawing(s), Specification(s), Plan(s), Report(s), Design(s), Model(s), or similar means of communicating the Basis of Design, and may be in paper or electronic format, and must be considered in their entirety.
 - .9 **Basis of Design:** refers the mechanical design intent inherent in the Mechanical Division Documents to establish a specific performance expectation and/or requirement. The Basis of Design may refer to specific equipment and/or products that have been used to establish an energy performance benchmark, and/or space constraint, and/or structural load, and/or a specific equipment arrangement, and/or operating sequence, and/or other similar consideration specific to the mechanical design intent.
 - .10 **Consultant:** when used in the Mechanical Division Documents it means the Prime Consultant and MCW Consultants Limited, Queen's Quay Terminal, 207 Queen's Quay West, Toronto, Ontario M5J 1A7.
 - .11 **Acceptable Manufacturer(s):** also referred to as "Standard of Acceptance", and/or "Alternative Manufacturer", "and/or Acceptable Alternative" and/or similar language that describes manufacturers other than the manufacturer used as the Basis of Design and shall all have the same meaning throughout the Mechanical Division Documents. Acceptable Manufacturers may be used in the Work in lieu of the Basis of Design manufacturers subject to meeting conditions stipulated elsewhere in the Documents.

- .12 **Supply:** includes tenses of "supply" when used in the Mechanical Division Documents means supply only for installation by Trades other than Mechanical Division Trades or under separate agreement. Additional obligations may be required by the Documents.
- .13 **Install:** includes tenses of "install" when used in the Mechanical Division Documents means install, connect, test, balance, and start-up complete. Additional obligations may be required by the Documents.
- .14 **Provide or provision of:** includes tenses of "provide" when used for any part of the Work of the Mechanical Division Documents it means to Supply, Install, connect, test, balance, and start-up. "Provide" or "provision of" includes preparation of Coordination Drawings, preparation of Final Set of "As-built" or "As-constructed" Drawings, and Commissioning in accordance with the Basis of Design. Further, "provide" or "provision of" means to procure, prepare, supervise, pay for, and take responsibility for the services referenced. Additional obligations may be required by the Mechanical Division Documents.
- .15 **Authorities or Authorities Having Jurisdiction or AHJs:** when used in the Mechanical Division Documents it means any and all agencies that enforce the applicable Laws, By-laws, Codes, Standards, Ordinances, Rules, Regulations, and Interpretations of same in the place of Work. There may be more than one AHJ.
- .16 **Acceptable:** when used in the Mechanical Division Documents, it means acceptable to the Consultant.
- .17 **Performance:** when used in the Mechanical Division Documents in relation to specified equipment, it means the performance inherent in the Basis of Design, and includes, but is not limited to;
- the flow capacity of equipment and systems as it applies to air, steam, water and other hydronic mediums,
 - heating and/or cooling energy, and energy transfer capacity,
 - the pressure capacities of equipment and systems as it applies to air, steam, water and other hydronic mediums;
 - physical limitations including, but not limited to, weight and space (both occupied and service requirements);
 - effect on ambient sound levels.
- .18 **BAS:** refers to the Building Automation System; also refers to "BMS" (Building Management System), also refers to "FMS" (Facility Management System), also refers to "DDC" (Direct Digital Control system). References to "BAS", "BMS", "FMS" and "DDC" generally have the same meaning; refer to Section 25 05 10 BAS General Requirements for additional information.
- .19 Wherever terms "indicated", "shown", "noted", "listed", or similar words or phrases are used they are understood, unless defined otherwise, to mean "indicated", "shown", "noted" or "listed" in the Mechanical Division Documents.
- .20 Wherever terms "reviewed", "satisfactory", "as directed", "submit", or similar words or phrases are used in the Mechanical Division Documents they are understood, unless defined otherwise, to mean that work or product(s) referred to as "reviewed by", "to the satisfaction of", "submitted to", the Consultant.
- .2 Additional Definitions and Terms are included in succeeding Mechanical Division 20, 21, 22, 23 and 25 Specification Sections, and in other Documents, and are inclusive to the list of Definitions and Terms above.

1.03 WORK INCLUDED

- .1 Sections of the Specifications are not intended to delegate functions, or to delegate Work or apply to any specific trade. The Work of the Contractor includes all labour, materials, equipment, permits and tools required for a complete and working installation as described in the Mechanical

Division Contract Documents, and are not necessarily limited to items in the following Mechanical Specification Sections:

Division 20 - Common Mechanical Work Sections:

20 01 10	Mechanical General Requirements
20 01 50	Mechanical Basic Materials and Methods
20 05 05	Mechanical Demolition
20 05 14	Mechanical Work in Existing Building
20 05 33	Electric Heat Tracing
20 05 48	Vibration Isolation
20 05 70	Motors, Motor Starters, Motor Control Centres, and Wiring
20 05 75	Variable Frequency Drives
20 05 95	Testing Adjusting and Balancing
20 07 13	Mechanical Ductwork Insulation
20 07 16	Mechanical Equipment Insulation
20 07 19	Mechanical Piping Insulation
20 08 10	Mechanical Commissioning

Division 21 - Fire Protection Sections:

21 20 10	Fire Extinguishers
----------	--------------------

Division 22 - Plumbing and Drainage Sections:

22 11 10	Potable Water Piping and Pumping Systems
22 13 10	Sanitary and Storm Water Drainage and Vent Piping and Pumping Systems
22 15 13	Compressed Air Systems
22 30 10	Plumbing Equipment and Specialties
22 40 10	Plumbing Fixtures and Drains

Division 23 - HVAC Sections:

23 10 10	Fuel Systems
23 21 13	HVAC Piping Systems, Valves and Accessories
23 21 23	HVAC Pumps
23 23 10	Refrigerant Piping
23 25 10	HVAC Chemical Treatment Systems
23 30 10	HVAC Ductwork
23 33 10	Air Duct Accessories
23 35 10	Fans and Blowers
23 36 10	Air Grilles and Diffusers
23 37 10	Air Terminal Control Units
23 40 10	Air Filters
23 57 10	HVAC Heat Exchangers
23 72 10	Air to Air Recovery Systems
23 74 16	Packaged Rooftop Air-Conditioning Units
23 81 26	Split System Air Conditioning Units

23 81 29	Variable Refrigerant Flow (VRF) Systems
23 81 43	Air Source Heat Pump Chillers
23 82 10	Terminal HVAC Equipment
23 83 15	Radiant Floor Heating and Snow Melting Systems
23 84 13	Humidifiers

Division 25 - Building Automation System ("BAS") and Controls Sections:

25 05 10	BAS General Requirements
25 10 10	BAS Control Network
25 30 10	BAS Instrumentation and Devices
25 56 26	Integrated Lighting System Controls

1.04 CONTRADICTION AND AMBIGUITY

- .1 Where there is apparent contradiction or ambiguity in the documents, or where there are apparent discrepancies in or omissions from the documents, or if there is any doubt as to the intent of the Contract Documents, the bidder shall request and obtain written clarification(s) from the Consultant prior to Bid submission.
- .2 Consideration will not be granted for misunderstanding of the intent of the Contract Documents or the extent of the Work to be performed.
- .3 Attend the job site prior to Bid submission and verify all conditions. Prior to submitting Bid price, the Mechanical Trade Contractor shall review any discrepancies and verify the locations of existing services that are being extended and the routing of new services. Report all ambiguities, discrepancies, departures from Laws, Building Code requirements, Regulations, By-laws and/or from good practice. Failure to do so will result in all additional costs being the responsibility of the Mechanical Trade Contractor. Include in the Bid submission price for any alternative routing of new or existing services to accommodate site conditions.

1.05 REGULATORY REQUIREMENTS

- .1 Comply with all requirements of the Authorities having Jurisdiction ("AHJs").
- .2 Comply with requirements of all Municipal, Provincial and Federal Bylaws and Ordinances as well as requirements of Utilities such as Ontario Gas Utilization Code and The Ontario Electrical Safety Code.
- .3 Do not reduce quality of any part of the Work shown on the Contract Documents and/or specified references by the Associations and Agencies in the following paragraphs.
- .4 In general, and as applicable, perform all Work of the Mechanical Trade Contractor such that it complies in all respects with the physical and chemical properties, characteristics and performance requirements of recognized Associations and Agencies as required by these Specifications, and as follows:

AMCA -	Air Moving & Conditioning Association
ADC -	Air Diffusion Council
ANSI -	American National Standards Institute
AHRI -	Air Conditioning Heating & Refrigeration Institute
ASCII -	American Standard Communication Information Interchange
ASHRAE -	American Society of Heating, Refrigeration and Air Conditioning Engineers
ASME -	American Society of Mechanical Engineers
ASPE -	American Society of Plumbing Engineers
ASTM -	American Society for Testing and Materials
AWWA -	American Water Works Association

CGA -	Canadian Gas Association
CGSB -	Canadian General Standards Board
CSA -	Canadian Standards Association
EIA -	Electronic Industry Association
ETL -	Electrical Testing Laboratories
FM -	Factory Mutual
ISA -	Instrument Society of America
IAO -	Insurers Advisory Organization
MMAH -	Ministry of Municipal Affairs and Housing
MTC -	Ministry of Transportation and Communication
NBC -	National Building Code of Canada
NPC -	National Plumbing Code of Canada
NFC -	National Fire Code of Canada
NFPA -	National Fire Protection Association
OESC -	Ontario Electrical Safety Code
OBC -	Ontario Building Code
OFC -	Ontario Fire Code
MOEE -	Ontario Ministry of Environment and Energy
OML -	Ministry of Labour and Worker's Compensation Requirements
TSSA -	Technical Standards & Safety Authority
ULC -	Underwriter's Laboratories of Canada
UL -	Underwriter's Laboratories Inc.
cUL -	Underwriter's Laboratories Inc. (testing completed to Canadian Standards)

1.06 STANDARDS

- .1 Provide new materials and equipment of proven design and quality. Provide current models of specified equipment manufactured in Canada or the United States of America, unless specified otherwise with published ratings certified by recognized North American testing and standards agencies.
- .2 Comply with ASHRAE/IES 90.1 Standards in the supply and installation of all parts of the Work.
- .3 Conform to the best modern practices of workmanship and installation means and methods, and employ only skilled tradesmen working under the direction of fully qualified personnel.

1.07 LEED REQUIREMENTS

- .1 The building will be certified under the Canadian Green Buildings Council, Leadership in Energy and Environmental Design. This requires all Construction Trades to adhere to certain requirements with respect to cleanliness, recycling, materials reuse and other practices which are part of the Contract requirements.
- .2 In addition to the above, ensure the following requirements are observed on site:
 - .1 Smoking shall not be permitted within the Work area, or outside the Work area but within the existing building. Refer to 'Smoking' Article in this Section of the specifications.
 - .2 Open ended ductwork shall be protected with plastic sheeting.
 - .3 Open ended piping shall be capped to limit ingress of debris.
 - .4 All trades shall practice recycling of waste, under direction of the Construction Manager.

- .3 Preparation and Implementation of a Demolition/ Construction IAQ Management Plan**
- .1 Prior to the commencement of Demolition/ Construction the Contractor shall prepare an IAQ Management Plan for review by the Owner's Project Manager and the Consultant. The purpose of the IAQ Management Plan is to identify potential sources of contamination at the site and to minimize their impact through appropriate preventative or mitigative controls.**
- .2 The Contractor shall be responsible for implementing all measures described in the reviewed IAQ Management Plan.**
- .3 Monitoring and documentation of implemented measures shall be required to demonstrate compliance with the IAQ Management Plan.**
- .4 The IAQ Management Plan shall include the following approaches for the demolition and construction stages of the Work:**
- .1 HVAC system protection as specified in this Section,**
- .2 Source Control Measures as follows:**
- .1 Control sources of contamination through implementation of the following practices to manage the anticipated or potential contaminant sources:**
- .1 Contractor shall notify the Owner's Project Manager when a construction activity is anticipated to cause contamination of the indoor air (i.e. excess dust, increased humidity, use of a product that will result in off-gassing to indoor air).**
- .2 Notification shall be made at least 48 hours before the planned commencement of the activity.**
- .3 The Contractor shall ensure that proper source control measures are in place prior to commencement of the activity.**
- .2 All adhesives, sealants, paints, coatings, flooring and wood products are to be low-emitting VOCs; shop drawings and/or product data sheets identifying the product's emissions and VOC content shall be submitted to the Owner's Project Manager for review prior to installation or application. Products that have not been approved are to be removed from the site.**
- .3 For potential off-gassing products, i.e. cleaning solutions, the Contractor shall follow the safe material handling procedures specified for the product. As necessary, additional temporary ventilation or exhaust measures shall be provided in the Work area.**
- .4 Contractors shall utilize demolition and construction techniques that minimize the release of contaminants, including airborne dust.**
- .5 Contractors shall utilize temporary dust extraction measures where possible to minimize airborne dust.**
- .6 Contractors are to immediately report any uncontrolled odours, dust or other contaminants identified in the work areas to the Owner's Project Manager.**
- .7 No vehicles are to idle in areas where emissions could be drawn into the building interior.**
- .8 Contractors will select electric powered rather than gasoline powered equipment to reduce emissions.**
- .9 Equipment will be turned off when not in use.**
- .10 Containers of wet products will be kept closed when not in use.**

- .11 **Waste materials that release dust or odors will be covered or sealed.**
- .3 **Pathway Interruption measures as follows:**
 - .1 **Where a contaminant source(s) cannot be satisfactorily controlled, the Contractor shall implement the following Pathway Interruption measures:**
 - .1 **A negative pressure will be created in the work area subject to contamination (i.e. air borne dust particles and other related pollutants).**
 - .2 **The negative pressurization will reduce contamination of other work areas.**
 - .3 **Make-up air for that being exhausted shall be achieved by the installation of portable fans. Air supply to the negative pressure spaces will be 100% fresh air.**
 - .4 **Exhaust air shall not be discharged where it can be drawn back into to the building (a minimum of 10m (30 ft.) of separation distance shall be provided to any building opening or air intake. Filtration for the temporary system may be required, depending on the controlled contaminant.**
 - .5 **Barriers will be erected to contain the construction area.**
 - .6 **Wood cutting will be conducted behind barriers to control dust.**
 - .7 **Persons working near drywall dust must wear protective masks.**
 - .8 **Welding arc exhaust fumes will be controlled with a point source exhaust system.**
 - .9 **As required, equipment or activities that produce excessive contaminants shall be located outdoors and away from air intakes so as not to compromise indoor air quality.**
- .4 **Housekeeping Measures as specified in this Section.**
- .5 **Scheduling measures as follows:**
 - .1 **The Contractor shall identify and schedule the Work to address and manage any potential IAQ concerns related to Demolition/ Construction activities.**
 - .2 **Scheduling measures shall address the following:**
 - .1 **Protection measures proposed,**
 - .2 **Source control measures proposed,**
 - .3 **Pathway interruption measures proposed,**
 - .4 **Specific housekeeping measures proposed.**
- .5 **Documentation, Inspection and Maintenance of IAQ Management Plan**
 - .1 **Requests to modify management processes outlined in this IAQ Management Plan must be submitted in writing to Owner's Project Manager for approval.**
 - .2 **Contractor's responsibilities with regard to the IAQ Management Plan will be communicated at the weekly contractor site meetings.**
 - .3 **A copy of the IAQ Management Plan shall be posted on site in a location available to all Trades.**

- .4 ***Contractor shall take digital photographs throughout the construction to capture the steps taken to comply with the requirements of the IAQ Management Plan. The Contractor shall forward photographs complete with date taken and identification of type of control measure highlighted.***
- .5 ***The Consultant shall conduct site inspections to ensure that the controls specified in the plan are being implemented. Information from Contractors, site inspection checklists and photographic documentation of the management controls will be collected to document compliance with the IAQ Management Plan. The Contractor shall be informed in writing of any deficiencies found during the site review.***
- .6 ***The Contractor shall provide 18 photographs—six photographs taken on three different occasions during construction—along with identification of the SMACNA approach featured in each photo. All SMACNA approaches used should be represented by at least one photo. The Region's consultant or Project Manager shall take additional photographs during routine site visits to document compliance with the IAQ Management Plan.***
- .7
- .8 ***Where deficiencies are identified by the Consultant or the Owner's Project Manager, the Contractor shall take corrective action and provide photographic evidence of correction within 48 hours.***
- .9 ***The Project Indoor Air Quality (IAQ) Management Checklist shall be completed by the project LEED Consultant and/pr the Owner's Project Manager; Checklist shall be provided to the successful Contractor following Contract award.***
- .10 ***The Contractor shall complete the Weekly Indoor Air Quality (IAQ) Management Checklist on a weekly basis and provide copies to the project consultants and the Owner's Project Manager. Any noted issues will be rectified immediately. Weekly Indoor Air Quality (IAQ) Management Checklist shall be provided to the successful Contractor following Contract award.***
- .11 ***The Contractor shall complete the Filter Listing at the end of the project and provide copies to the Consultants and the Owner's Project Manager. Filter Listing shall be provided to the successful Contractor following Contract award.***
- .6 ***Complete the An IAQ testing or flush-out procedure Specified in Section 20 08 10. Submit a copy of the IAQ testing and/or flush-out/ procedures and the documented results.***
- .7 ***Modifications to IAQ Management Plan***
 - .1 ***The IAQ Management Plan identifies the indoor air quality management controls to be implemented, maintained, and monitored on this project, however, it should be considered a "living document" that may be changed or adapted during the life of the project to be effective.***
 - .2 ***Changes or adaptations to the IAQ Management Plan may occur under the following conditions:***
 - .1 ***Controls and/or practices are not achieving the desired results,***
 - .2 ***Project scheduling prevents certain activities from being completed, or***
 - .3 ***An alternative procedure for control that meets the intent of the original plan and is approved by the Owner's Project Manager.***
- .8 ***Copies of all photographs, Project Indoor Air Quality (IAQ) Management Checklist, Weekly Indoor Air Quality (IAQ) Management Checklists, Pre-Occupancy Filter List***

and flush-out/IAQ testing procedures and results shall be provided to the Owner's Sustainable Building Engineer, Property Services Branch for LEED submission purposes.

- .9 ***Periodic checks for Plan compliance will be made by the LEED Facilitator.***
- .4 Mechanical initiatives selected to be designed into the project include the following:
 - .1 Use of ultra-low flow plumbing fixtures throughout the project.
 - .2 Energy efficient cooling and heating systems through the use of internal energy reclaim, condensing gas boilers, variable speed drives on multiple pumps and fans, and other measures inherent in the design.
 - .3 Use of CO2 sensors and air flow measurement to monitor and control air quality on each high density occupied HVAC Control zone;
 - .4 Use of high efficiency building envelope and glazing systems.
 - .5 Commissioning of all mechanical building systems, including verification by a third party.
 - .6 Use of non-chlorinated refrigerants in all equipment.
 - .7 ***An IAQ Management Plan as Specified above.***

1.08 PERMITS, FEES & INSPECTIONS

- .1 Apply for, pay for, and obtain all permits, licenses, inspections, examinations and fees required for the Work. Also submit, when required by the Authorities Having Jurisdiction ("AHJs"), information such as heat loss calculations, and other data that may be obtained from the Consultant. Should the AHJs require the information on specific forms, fill in these forms by transcribing the required information provided by the Consultant.
- .2 Before starting any work, submit the required number of copies of Drawings and Specifications to the AHJs for their approval and comments. Comply with any changes requested as part of the contract, but notify the Consultant immediately of such changes. Prepare and submit any additional drawings, details or information as may be required.
- .3 Arrange for inspection of all Work by the Authorities Having Jurisdiction ("AHJs") over the Work. On completion of the Work, present to the Consultant the final unconditional certificate of acceptance of the inspecting AHJs.
- .4 In case of conflict, codes and regulations take precedence over the Contract Documents. In no instance reduce the standard or scope of work or intent established by the Drawings and Specifications by applying any of the Codes and Standards referenced in these Specifications.

1.09 CONTRACT DRAWINGS

- .1 The Drawings for Mechanical Work are performance drawings, diagrammatic, intended to convey the scope of work, indicate general Design Intent, arrangement and approximate location of mechanical equipment. The Drawings do not intend to show Architectural and Structural details.
- .2 Do not scale Drawings. Obtain information involving accurate dimensions from dimensions shown on Architectural and Structural Drawings, and by site measurement.
- .3 Make, at no additional cost, any changes or additions to materials, and/or equipment necessary to accommodate structural conditions (pipes or ducts around beams and columns and other structural elements).
- .4 Alter, at no additional cost, the locations of materials and/or equipment as directed that do not necessitate additional material.
- .5 Install ceiling mounted or exposed components (examples include diffusers, sprinkler heads, grilles) in accordance with reflected ceiling drawings or floor plans.
- .6 Confirm on the site the exact location and mounting elevation of outlets and fixtures as related to existing Mechanical and Electrical components and Architectural and Structural details.

1.10 EXAMINATION OF THE PLACE OF THE WORK AND DOCUMENTATION

- .1 Prior to submitting tender, carefully examine conditions at the place of the Work that could affect the Work of the Mechanical Trades. Refer to and examine all Contract Documents.
- .2 Verify that materials and equipment can be delivered to the Place of the Work and that sufficient space and access is available to permit installation thereof in locations shown on the Drawings.
- .3 Verify location and elevation of existing services (water, electrical, sanitary, storm sewers, equipment, ductwork and piping) which may affect the Tender and Work of the Mechanical Trades. Repair any damage to existing underground services caused by neglect to determine and mark out the location of such services prior to excavation work commencing.
- .4 Please direct any inquiries regarding the bid documents in writing to: dmackeracher@mcw.com. Other forms of communication will be ignored. All questions will be responded to in writing and submitted to all active proponents. Directly contacting any other member of the Owner's staff with respect to this RFP at any time prior to the award of a Contract or the termination of the RFP, and the Owner may reject the Proposal of any Proponent that makes any such contact.

1.11 PRODUCT STANDARDS, ACCEPTABLE MANUFACTURERS, AND REQUESTS FOR PRODUCT SUBSTITUTION

- .1 Provide new material and equipment as specified and to acceptance of the Consultant. Acceptable Manufacturers' names are listed to set a standard of quality, performance, capacity, size, weight, appearance and serviceability.
- .2 Where no Acceptable Manufacturer is indicated, provide only as specified. Where "or equivalent" or "or equal" is noted in the Specifications under Acceptable Manufacturers, a request for acceptance of an equivalent Manufacturer or Product not listed must be submitted not less than seven (7) working days prior to the bid submission date. Submissions for an equivalent or equal manufacturer made after bid submission must be accompanied by a credit offering to the Owner for consideration, otherwise the listed Manufacturer shall be provided.
- .3 Assume full responsibility for ensuring that when providing Acceptable Manufacturers, all performance, space, weight, connection sizes and location (mechanical and electrical), power and wiring requirements, are included within the scope of the item quoted, and costs for any variances therefore are included in the quoted Tender amount. Equipment requiring greater than specified energy requirements, or greater installation and service space requirements, or requiring greater than the structural capacity allowed for, or otherwise adversely affecting the appearance or integrity of the building may be considered grounds for rejection by the Consultant.
- .4 All electrically operated equipment and electrical materials to bear the label of approval of CSA or be so stamped, or have special approval of the Authorities Having Jurisdiction. All material, wiring and devices to conform to the Canadian Electrical Code for the purpose for which they are to be used. All electrical equipment to be designed and manufactured in accordance with applicable EEMAC and ANSI specifications.
- .5 All gas fired equipment to bear the label of the CGA or be so stamped.
- .6 All plumbing products such as fixtures, faucets, flush valves and shower heads to bear the label of approval of the CSA or be so stamped.

1.12 IDENTIFICATION OF NON-CONFORMING MATERIALS AND EQUIPMENT

- .1 Submit documentation at time of bid, identifying nature and extent of non-conformance and/or variances from specifications or referenced standards.
- .2 Failure to submit this documentation at time of bid will be interpreted as confirmation that materials and equipment, including workmanship, hardware, software and other related ancillaries required will be provided in strict accordance with the Mechanical Contract Documents.

1.13 SHOP DRAWINGS

- .1 As soon as possible after the award of the Contract the Contractor shall submit to the Consultant a summary of Shop Drawing submissions for review.
- .2 Submit shop drawings for review in sufficient quantities to satisfy contractual requirements. Shop drawings pertain to each particular item as specified; show project and component name, item

reference number, certified physical and performance data; and clearly indicate all applicable parts and accessories. Affix Contractor's "Approved" stamp on all copies of all shop drawings prior to their submittal to the Engineer for review. Approval stamp shows name of firm, date the approval was made and the checker's signature or initials. Should the above requirements not be adhered to, submitted shop drawings will be returned without further Consultant review for proper re-submittal.

- .3 Submit shop drawings for items and equipment specified in the sections of the Mechanical Division. Identify the equipment by system name and number as similarly identified on the drawings.

- .4 Each Shop Drawing will be stamped by the Consultant in the following format:

<input type="checkbox"/> NOT REVIEWED	<input type="checkbox"/> REVIEWED
<input type="checkbox"/> RESUBMIT	<input type="checkbox"/> REVIEWED AS MODIFIED
<input type="checkbox"/> NOT SPECIFIED BY MCW, REVIEWED FOR MEP ONLY	

This stamp will be applied by the Consultant to each shop drawing.

- .5 This review by the Consultant is for the sole purpose of ascertaining conformance with the design concept. This review shall not mean that the Consultant approved the detail design inherent in the shop drawings, responsibility for which to remain with the Contractor, and such review shall not relieve the Contractor of responsibility for errors or omissions in the shop drawings or responsibility for meeting all requirements of the Mechanical Division Contract Documents. The Contractor is responsible for dimensions to be confirmed and correlated at the job site, for information that pertains solely to fabrication processes or to techniques of construction and installation and for co-ordination of the work of other interfacing Trades as well as compliance with all Codes and requirements of the Authorities Having Jurisdiction.
- .6 Products not specified by MCW are reviewed to confirm compliance with services provided only. Any changes required between provided services and shop drawing requirements will be identified for coordination between trades.
- .7 It is the Contractor's responsibility to bring to the attention of the Consultant all physical, performance or other deviations from the Contract requirements. The Contractor shall provide a cover sheet with each Shop Drawing submission, on the Contractor's letterhead, including a summary clearly highlighting any and all deviations from the requirements of the Mechanical Division Contract Documents.
- .8 For equipment, provide performance, physical and operating data as described in the Mechanical Division Contract Documents and listed in equipment schedules. Provide performance curves for all pumps and fans specified. Include sound power data for any equipment such as fans, pumps, terminal devices, grilles and diffusers, chillers, cooling towers, or whenever equipment performance affects sound sensitive spaces.
- .9 Provide dimensions and mounting details for all items of equipment, and weight and support point loads of equipment weighing in excess of 14 kg (30 lbs.).
- .10 All dimensions, weights and performance characteristics to be in the same units used in the Specifications and shown on the Drawings (SI or Imperial). Shop drawings not submitted in conformance with the foregoing may be considered grounds for rejection.
- .11 Where equipment is specified with control panels or electrical control components such as float switches, control valves, level controllers, relays and similar components provide wiring diagrams and descriptions that are specific to the item. General data covering a wide range of similar devices or components is not acceptable.
- .12 Bind one complete set of "Reviewed" or "Reviewed as Modified" shop drawings in the Operating and Maintenance ("O&M") manuals; do not include shop drawing marked "Revise and Re-Submit".

1.14 PATENTS

- .1 Pay all royalties and license fees, and defend all suits or claims for infringement of any patent rights, and save the Owner and Consultant harmless of loss or annoyance on account of suit, or claims of any kind for violation or infringement of any letters patent or patent rights, by this Subcontractor or anyone directly or indirectly employed by him or by reason of the use by him or them of any part, machine, manufacture or composition of matter on the work, in violation or infringement or such letters patent or rights.

1.15 RIGHTS RESERVED

- .1 Rights are reserved to issue any additional Detail Drawings, which in the judgement of the Consultant may be necessary to clarify the Work, and such Drawings shall form a part of the Contract.

1.16 EQUIPMENT NAMEPLATES

- .1 Provide apparatus (including electric motors) with proper nameplates affixed thereto, showing the size, name of equipment, serial number and all information usually provided, which also includes voltage, cycle, phase and horsepower of motors and the name and address of the Manufacturer.

1.17 COMPLETION

- .1 The following are considered to be the minimum requirements of mechanical systems readiness in order that they may be considered by the Owner as ready for the intended use of the Work contracted to be performed in accordance with requirements described in the Ontario Construction Lien Act regardless of the value of Work remaining to be performed.
- .2 General completion requirements:
 - .1 Mechanical Commissioning complete in accordance with Section 20 08 10.
 - .2 Operating and Maintenance ("O&M") Manuals submitted to Engineer for review.
 - .3 Letter of Completion and documentation from all Sub-trade(s) submitted.
 - .4 Mechanical wiring including all power, control and communication wiring, has been completed and accepted by the Authorities Having Jurisdiction (AHJs)
 - .5 All certification, test and inspection certificates submitted.
 - .6 Integrated Systems Testing of Fire Protection and Life Safety Systems shall be completed in accordance with CAN/ULC-S1001 with the participation of all affected Trades.
 - .7 Final Record Set of "As-Constructed" or "As-built" Drawings completed, checked and submitted for HVAC, and Plumbing & Drainage.
 - .8 Final Record Set of "As-Constructed" or "As-built" Drawings completed, checked and submitted for fire protection.
 - .9 Confirm program for warranty period, including site visits and assistance to Owners for Operations and maintenance and controls. Extended warranty forms completed and submitted.
 - .10 System performance tests complete and verified.
 - .11 Cleanup completed (air filters, strainers, and other similar equipment cleaned and/ or replaced).
 - .12 Confirm access to equipment and other components requiring servicing (valves, dampers, and other similar serviceable equipment and devices).
 - .13 Thermometers, pressure gauges and filter gauges in place.
 - .14 Flexible connections and isolators free from binding.
 - .15 Painting, identification and valve tagging completed.
 - .16 Equipment lubricated and accessible for maintenance.
 - .17 Testing, Adjusting and Balancing ("TAB") work completed or nearing completion.
 - .18 Vibration and sound control verified in accordance with reference levels.

- .19 Insulation repaired and proper finish applied.
- .20 Pipe, duct and equipment identification completed.
- .21 Fire-stopping completed.
- .22 Turnover seminar and instructions to Owner completed.
- .3 Plumbing and Drainage system completion requirements:
 - .1 Pumps adjusted, balanced and operating correctly.
 - .2 Hydro-pneumatic and/ or expansion tank(s) charged and functioning correctly.
 - .3 All backflow preventers installed and functioning.
 - .4 Plumbing fixtures cleaned and water flows adjusted.
 - .5 Proper access to all cleanouts confirmed.
 - .6 Equipment drains taken to hub or funnel drain.
 - .7 Expansion and contraction provisions satisfactory.
 - .8 Thermometers and gauges installed.
 - .9 Gas connections to all equipment completed and inspected.
- .4 Fire Protection and Life Safety System completion requirements:
 - .1 Sprinkler systems tested and inspected as per NFPA 13.
 - .2 Standpipe systems tested and inspected as per NFPA 14.
 - .3 Emergency power generating equipment, transfer switches and distribution systems are complete and operational.
 - .4 Emergency power natural gas service and distribution systems are complete and operational.
 - .5 Fire extinguishers installed (or turned over to Owner if mutually agreed).
 - .6 Fire dampers, smoke dampers and combination fire and smoke dampers installed, tested and functioning as intended.
- .5 Hot Water Heating and Hydronic Circulation System completion requirements:
 - .1 Chemical cleaned piping and treatment charged.
 - .2 Expansion tank charged.
 - .3 Terminal units operating.
 - .4 Pumps adjusted, balanced and operating correctly.
 - .5 Boiler test fired and results submitted.
- .6 Chilled Water Cooling and Hydronic Circulation System completion requirements:
 - .1 Chiller start-up and commissioning complete;
 - .2 Cooling tower and/ or similar heat rejection equipment start-up and commissioning complete.
 - .3 Chemical cleaned piping, feed pump installed and treatment charged.
 - .4 Expansion tank charged.
 - .5 Pumps adjusted, balanced and operating correctly.
 - .6 Terminal unit isolators installed and units secured to mounting pads.
 - .7 Heat trace and freeze protection installed and tested.
 - .8 Refrigerant charged.
 - .9 Terminal unit controls tested and operating.

- .10 Terminal units commissioned test and results submitted.
- .11 Leak exhaust system installed and tested.
- .7 Heating Water System completion requirements:
 - .1 Chemical cleaned piping, feed pump installed and treatment charged.
 - .2 Heat pump start-up and commissioning complete.
 - .3 Humidifier operation verified.
- .8 Ventilation System completion requirements:
 - .1 Building exhaust systems serving building are complete, operational and balanced.
 - .2 Air handling system and exhaust fan system controls are complete, operational and balanced.
 - .3 Supply, return and exhaust air distribution ductwork complete and pressure tested.
 - .4 Supply, return and exhaust air outlets tested, adjusted and balanced.
 - .5 Distribution ductwork and air intake and exhaust plenums cleaned.
 - .6 Construction filters removed and new permanent air filters provided.
 - .7 Space ambient sound levels verified and any excess noises resolved.
 - .8 Shipping blocks removed.
 - .9 Start-up reports completed.
 - .10 Cooling coil condensate drains installed, cleared and flowing freely.
- .9 Rooftop HVAC Equipment completion requirements:
 - .1 Roof-mounted exhaust fans secured on bases.
- .10 Building Automation Systems ("BAS") and Control system completion requirements:
 - .1 Building Automation Systems ("BAS") and Control systems for all building systems are complete, operational and verified as functioning correctly.
 - .2 Panel layout sheets complete with point name, point address and wire identification number. One copy attached to each respective panel door.
 - .3 All points tagged with point name, point address and panel number.
 - .4 "As-built" control drawings submitted.
 - .5 "As-built" program flowcharts submitted.
 - .6 "As-built" ladder wiring diagrams showing all hardware interlocks submitted.
 - .7 Complete O&M Manual submitted (including apparatus and O&M Manual for all sensors, transducers, solid state relays, and similar equipment and devices).
- .11 ***IAQ Testing or Flush-out Procedure as specified in Section 20 08 10 completed.***

1.18 WARRANTIES

- .1 Provide warranties on specified products, equipment and components as well as on the installation of these items. Include for all costs for cutting and patching, removal of equipment and restoration materials and work and repairs to other equipment affected in performance of warranty work.
- .2 Provide warranty certificates, wherever given or required, that are in excess of the normal warranty period showing the name of the firm giving the warranty, dated and acknowledged, on specific equipment and systems.
- .3 Warranty periods for temperature controls and Building Automation System ("BAS") to start on the date of verification of acceptance issued in writing by the Consultant.

- .4 The date of verification of acceptance is independent of Substantial Performance of the Work and may occur after certification of Substantial Performance.
- .5 Acceptance of the Building Automation System ("BAS"); refer to Section 25 10 10.
- .6 Include verification of acceptance certificates with the maintenance and operating manuals in the appropriate sections.

1.19 SCHEDULE

- .1 Comply with the Owner's target Substantial Performance date.
- .2 As soon as possible after the award of the Contract the Contractor shall submit to the Consultant a Schedule for review that achieves the target Substantially Performance date.
- .3 Building Services and normal operation of the remainder of the building shall be maintained.
- .4 Include for all necessary premium or overtime costs to perform work outside of normal working hours that, in the Owner's opinion, would disrupt the normal operation and use of the building.
- .5 Existing services shall be cut back and connections capped at concealed locations. Finishes shall be made good to match adjoining surfaces.
- .6 Where existing equipment is to be re-used, but interferes with the new construction, the existing work shall be temporarily relocated until new work is complete. Services to temporarily located equipment shall be maintained at all times.
- .7 Unless noted otherwise, existing mechanical equipment and materials which become redundant shall be completely disconnected and removed from the site. At the Owner's instruction, equipment and materials shall be turned over to the Owner on site. Disposition shall be confirmed with the Owner prior to removal.

1.20 SCHEDULE OF VALUES

- .1 As soon as possible after the award of the Contract the Contractor, shall submit to the Consultant for review a Schedule of Values (SOV) breaking down of the Contract amount according to Trades performing the Work, major equipment purchases, and site mobilization and demobilization costs.
- .2 Site mobilization costs shall be no more than 1.5 times the value of site demobilization costs.

1.21 CHANGES TO THE WORK

- .1 Unless otherwise stated in the Contract, the Supplementary Conditions or General Instructions, whenever Consultant proposes in writing to make a Change or revision to design, arrangement, quantity, or type of any work from that required by the Documents, prepare and submit to Consultant for review, a quotation for executing the Change or revision. The Change or revision shall be determined by one or more of the following methods as determined by the Consultant:
 - .1 By estimate and acceptance of a lump sum ("Lump Sum Method"); or
 - .2 Where unit prices, discounts and allowances are set out in the Contract Documents or subsequently agreed upon, in accordance with such unit prices ("Unit Price Method"); or
 - .3 By actual time and material costs and a fixed or percentage fee for overhead and profit ("Time and Material Method").
- .2 Changes in the Work evaluated using the Lump Sum Method or Time and Material Method shall be based on the following factors:
 - .1 For Materials and Equipment - The latest edition of Allpriser published list prices, less the following discounts:

	Item	Discount
1	Steel Pipe	50%

	Item	Discount
2	Copper Pipe	45%
3	Cast Iron Soil Pipe	45%
4	Stainless Steel Pipe and fittings:	45%
5	Welded Fittings:	50%
6	Grooved Fittings:	30%
7	Threaded Fittings:	40%
8	Cast Iron Screwed Fittings:	40%
9	Copper Fittings:	45%
10	Cast Iron MJ Fittings:	35%
11	Valves:	25%
12	Insulation Materials:	35%
13	All Other Materials:	25%
14	Equipment Rental:	Actual Rate, but not to exceed local rates.

- .2 For Base Labour Units:
 - .1 mechanical labour unit costs are to be in accordance with Mechanical Contractors Association of America (MCAA) Labor Estimating Manual;
 - .2 electrical labour unit costs are to be in accordance with National Electrical Contractors Association (NECA) Manual of Labor Units;
 - .3 other such standardized trade units that may exist, on a Journeyman basis.
- .3 Provide copies of the Allpriser published list prices used to estimate material and equipment costs, and copies of the NECA, MCAA, SMACNA or other such standardized trade rates used to determine labour units when requested by the Consultant.
- .4 It is understood that each change may have a variety of non-typical or abnormal factors that will require adjustments. Under no circumstances shall the cumulative total of additional factors exceed 20% of the hours established using Base Labour units.
- .5 Labour rates shall include all associated project management, estimating, supervision, scheduling, coordination, interference, as-built drawing production/updates, travel time and associated expenses, delivery charges, clean-up, printing, telephone and other office expenses, and applicable employee benefits and burdens including, but not limited to:
 - .1 Base Rate
 - .2 Vacation/Stat Pay
 - .3 Union Deductions
 - .4 Legislated Burdens
 - .1 Employer Health Tax (EHT)
 - .2 Workplace Safety and Insurance Board (WSIB)
 - .3 Employment Insurance (EI)
 - .4 Canadian Pension Plan (CPP)

- .5 Retail Sales Tax (RST) on Hardware.
 - .5 Expendable Small Tools
 - .6 Additional Unionized Charges
 - .7 Finance Payroll
 - .8 Rest Breaks
 - .9 Idle Time
 - .10 Safety
 - .1 Job Box Talks
 - .2 WHMIS
 - .3 Fall Protection
 - .4 Personal Protective Equipment
 - .5 Committees
 - .11 Labour Warranties
- .3 The following additional requirements apply to all Change quotations submitted:
 - .1 costs for Journeyman and Apprentice labour must not exceed prevailing rates at time of execution of Contract and must reflect actual personnel performing the work;
 - .2 Change pricing must be such that Site Superintendent's involvement is necessary; cost for Site Superintendent must not exceed 10% of total hours of labour estimated for Change or revision;
 - .3 Change quotations, including those for deleted work, to include a figure for any required change to Contract time.
- .4 The Contractor shall at the request of the Owner, and/or the Project Manager, and/or the Consultant provide all required supplementary documentation requested by the Owner, and/or the Project Manager, and/or the Consultant for any Change.
- .5 Where Changes are evaluated using either the Lump Sum Method, or the Time and Material Method, the cost to the Owner shall be the actual cost of credits and, where additional work is required. The cost to the Owner shall be the actual cost plus a percentage covering overhead and profit, after all credits included in the Change have been deducted.
- .6 Where Changes are evaluated using either the Lump Sum Method, or the Time and Material Method, credit pricing for deleted work not already performed shall have a credit value assessed that is not less than 80% of the value of charges for similar new work.
- .7 Where Changes are evaluated using either the Lump Sum Method, or the Time and Material Method, the mark-up for overhead and profit shall be limited to and be calculated as follows:
 - .1 Work carried out by the Trade Contractor or Trade Subcontractor: 10% overhead and profit combined.
 - .2 Trade Contractor's overhead and profit on Trade Subcontractor's work: 5% overhead and profit combined.
- .8 The cumulative total percentage for overhead and profit charged by the Trade Contractor, Trade Subcontractor and others shall not exceed 20% of the cumulative total value of such change in the work, net of overhead and profit.
- .9 Trade Contractor and Trade Sub-contractor's overhead and profit shall be calculated based on net additional work only.
- .10 For Changes involving net deletions only, overhead and profit shall not be deducted, but shall include taxes and duties.
- .11 Where Changes are evaluated using the Unit Price method, the value of the change shall be based on the net difference in quantities with the appropriate Unit Rate applied.

- .12 Where changes are extensive, or where requested by the Owner, and/or Project Manager, and/or Consultant, material and labour take-offs shall be organized on a drawing-by-drawing, or area-by-area basis by the Contractor to more readily facilitate verification of quantities and labour hours.
- .13 Change quotation summaries shall itemize HST separately.
- .14 Change quotations submitted that are not in accordance with requirements specified above will be rejected and returned for re-submittal.
- .15 Failure to submit a proper quotation to enable the Owner, and/or Project Manager, and/or Consultant to expeditiously process quotation and issue a Change Order will not be grounds for any additional change to Contract time.
- .16 Submit proposed Change quotations in writing for review by Consultant; if Consultant agrees a Change Order will be issued.
- .17 Do not execute any Change or revision until written authorization for Change or revision has been issued by the Consultant.

PART 2 - PRODUCTS

2.01 GENERAL

- .1 ***Generally, and unless specified otherwise, HVAC equipment, shall be provided as "Thermostat-Ready" meaning that the Building Automation System (BAS) shall have direct control over terminal equipment, and custom fabricated air handling units (AHUs) and other similar built-up equipment that include dampers, control valves, heating and cooling stages without the requirement of BACnet, Lonworks or other type of communication interface. Factory installed interlocks, safeties and anti-cycle timers shall be provided as required.***

2.02 INTERFERENCE/ COORDINATION MODEL

- .1 The Mechanical Trade Contractor shall take the lead role in preparation of electronic Three Dimensional (3D) Building Information Model (BIM) interference/ coordination model with drawing sheet files set similar to Consultant drawings views. Use all other disciplines electronic drawings as basis for preparation of interference/coordination model. Position all Mechanical Trade and Sub-trade services to accommodate the work of other Construction Trades.
- .2 The tender documents including, the BIM model are not complete, nor fully coordinated. The model is not to be considered sufficiently detailed to build from.
- .3 Continuously update the interference/coordination model to accurately reflect all instructions issued by the architect and consultants in whatever format these instructions are issued. Assume for Bid submission purposes, that an updated BIM model will not be issued with each instruction.
- .4 Prior to commencement of work, submit for Consultant review the Mechanical Trade Contractor shall fully develop their own interference/coordination model using models from all other Construction Trades, and fully coordinate the installation prior to fabrication or installation of any services on site. All sub-trades whose work is affected by the information presented on each of these interference/coordination models shall sign-off on the drawings and thereby agrees to coordinate their parts of the work. Submit the completed interference/coordination model for review using the same procedures as specified for Shop Drawings.
- .5 Coordinate equipment placement to ensure that all components will have adequate access for operation, service and maintenance prior to commencement of Work. Services shall be laid out in an organized manner, including running services in parallel or at right angles from one another where these are exposed. Adequate access points shall be provided to service, maintain and operate the equipment as required.
- .6 Use the project's Architectural Revit model as the starting point for the creation of interference/coordination model. The contractor's drawings will show angles, braces, supports, and similar equipment that are not in the design model. Use the electrical contractor's model and not the electrical design files; use the structural steel contractor's model and not the structural design files.

- .7 Prepare interference/coordination model in conjunction with other Construction Trades, wherever a potential conflict due to the positioning of Mechanical Trade Contractor equipment, piping, ductwork or other Work exists.
- .8 Dimension proposed location of Mechanical Trade Contractor Work with respect to building elevations and established grid lines.
- .9 Prepare fully dimensioned details of all shafts, duct spaces and pipe spaces. Show sleeving, recessed and formed holes required in concrete for Mechanical Trade Contractor Work. Include information pertaining to access, clearances, tappings, housekeeping pads, drains and electrical connections.
- .10 Base information used to prepare interference/coordination model on reviewed Shop Drawings.
- .11 Provide field interference/coordination model showing the position of various services when required by Consultant.
- .12 The Mechanical Trade Contractor shall be responsible for the full coordination of all mechanical services with the existing building, new construction, and all new and existing services from all Construction Trade disciplines.
- .13 Submit a list of access doors and panels showing proposed type, size and location. The interference/coordination model shall incorporate Architectural details including reflected ceiling plans prior to submission.
- .14 Revise or alter the arrangement of work that has been installed without proper coordination, study and review, in order to conceal the work behind finishes, or to allow the installation of other work, at no additional cost. If any conflicts are identified submit alternate proposal to the consultant for review prior to proceeding with any work.
- .15 All shut-off valves, balancing devices, air vents, equipment and similar products, particularly such products located above suspended ceilings must be located for easy access for servicing and/or removal. Products which do not meet this location requirement are to be relocated to an accessible location at no additional cost.
- .16 The Contractor and their Sub-trades shall take complete responsibility for remedial work that results from failure to coordinate the work prior to fabrication, purchasing and/or installation. Pay for the cost of alterations to other work required by the alterations work made necessary due to a lack of preparing a comprehensive interference/coordination model.

2.03 EMBEDDED MECHANICAL SERVICES DRAWINGS

- .1 Prepare embedded mechanical services drawings, showing size and location of elements including any conduit and inslab services required.
- .2 Prepare insert setting drawings for work to be cast into concrete and/or mortared into masonry elements.
- .3 Submit embedded mechanical services drawings to the Consultant and Structural Engineering Sub-Consultant for review.

2.04 SLEEVING DRAWINGS

- .1 Prepare sleeving drawing in conjunction with all affected Trades. Showing sleeves and openings for passage through structure, and all inserts, equipment bases, sumps, pits and supports, and relate these to suitable grid lines and elevation datum.
- .2 Submit sleeving drawings to the Consultant and Structural Engineering Sub-Consultant for review.

2.05 FINAL RECORD SET “AS-CONSTRUCTED” OR “AS-BUILT” DRAWINGS

- .1 Meet the requirements of Division 01 and the following.
- .2 Suitably store and protect Record “As-Constructed” or “As-built” Drawings on site and make available at all times for inspection.

- .3 Record inverts of underground piping at building entry/exit and below floor slab at each branch, riser base, change in direction as well as at least three points on straight runs.
- .4 Show locations of access doors and panels and identify the equipment and components that they serve.
- .5 Transfer all of the Mechanical Trade Contractor's "As-Constructed" or "As-built" information to an electronic, editable version of the Consultant's BIM model format Record Drawings prior to submission to Consultant for review.
- .6 Submit Final Record Set of "As-Constructed" or "As-built" Drawings for review in PDF format and hard copy for review. Submit reviewed Final Record Set of "As-Constructed" or "As-built" Drawings in an editable format with the O&M Manuals.

2.06 OPERATING AND MAINTENANCE ("O&M") MANUALS

- .1 Each O&M Manual shall contain the following information:
 - .1 The Mechanical Trade Contractor(s) and Subcontractor(s) contact information including name, address, telephone number and email address;
 - .2 Mechanical Equipment Suppliers and Mechanical Sub-trades names and telephone numbers;
 - .3 description of each system with description in layman's terms of each major component of system;
 - .4 complete sets of "Reviewed" or "Reviewed as Modified" Shop Drawings and other Submittals including Interference/ Coordination Model, Embedded Mechanical System's Drawings, and Sleeving Drawings;
 - .5 equipment manufacturer's installation, start-up and operation manuals;
 - .6 equipment manufacturer's recommended spare parts lists;
 - .7 equipment wiring diagrams;
 - .8 lubrication schedule for all equipment;
 - .9 equipment identification list with serial numbers;
 - .10 page size valve tag schedule and flow diagrams;
 - .11 final balancing reports;
 - .12 water treatment procedure and tests;
 - .13 complete set of Mechanical Trade Contractor Final Record Set of "As-constructed" or "As-built" Drawings including updated Control Drawings and Schematics;
 - .14 full and final sequences of operations;
 - .15 facility operating schedules (climate control, security, lighting, access, and similar);
 - .16 relevant fire and emergency systems and procedures;
 - .17 energy conservation strategy, optimization benchmarks, and tests;
 - .18 seasonal start-up and shutdown procedures;
 - .19 copies of posted instructions;
 - .20 environmental authorities' compliance requirements;
 - .21 problem- and issue-reporting procedures;
 - .22 the potential consequences if the equipment or system malfunctions;
 - .23 alternative and backup systems that should be used in the event of a breakdown or failure.
 - .24 extended warranty documentation if applicable;
 - .25 certificates for:

- .1 equipment start-up and Commissioning complete;
 - .2 Controls and Building Automation Systems Commissioning complete;
 - .3 Pressure tests (domestic water piping, drainage system piping, fire protection piping, heating/cooling piping, ductwork) certifying system tested, pressure held, time of test and date and certification by the Consultant.
- .2 Ensure that the terminology used in various sections of the O&M Manual is consistent.

PART 3 - EXECUTION

3.01 GENERAL INSTALLATION REQUIREMENTS

- .1 Periodic inspections of the work in progress will be made to check general conformity of the work to the Contract Documents. Observed deficiencies will be reported. Correct deficiencies immediately upon notification.
- .2 Comply with Manufacturer's requirements for the installation of all specified equipment and the requirements of all Laws, Bylaws, Codes, Regulations, and all requirements of the Authorities Having Jurisdiction ("AHJs"). Furnish certificates and evidence that Mechanical Trades Work meets the requirements of the Authorities Having Jurisdiction.
- .3 Where the Contract Documents, instructions or where the Authorities Having Jurisdiction ("AHJs") require Mechanical Trades Work to be tested, inspected, or approved, give sufficient notice of its readiness for inspection and schedule the date and time for such inspection.
- .4 Uncover Work performed by Mechanical Trades that is covered up without consent, upon Consultant request, for examination and restore at no extra cost to the Owner.
- .5 Provide all required Mechanical equipment, including all devices, components and other ancillaries required for the intended system operation inherent in the Design as outlined in the Drawings and Specifications.
- .6 Include for all labour necessary for the successful completion of point-to-point verification of equipment, including all devices, components and other ancillaries as part of the project commissioning requirements.
- .7 Include for all labour necessary for the successful completion of performance verification of equipment, including all devices, components and other ancillaries as part of the project commissioning requirements.

3.02 FIREWATCH

- .1 ***Throughout all construction activities, Fire Alarm and Life Safety Systems shall remain operational. If any portion of a Fire Alarm System including zones or devices needs to be bypassed, or otherwise deactivated to complete the Work, the Contractor shall implement a Firewatch.***
- .2 ***Firewatch procedures are to be conducted in accordance with latest edition of the Ontario Fire Code. Where interpretations are required, coordinate with the Owner, the Consultant and Authorities Having Jurisdiction (AHJ). Refer to the Ontario Fire Code for Firewatch requirements and expectations.***
- .3 ***The following outlines the anticipated Firewatch procedures required:***
 - .1 ***Contact the Owner a minimum of 48 hours (2 business days) prior to initiation of Firewatch.***
 - .2 ***Contractor shall subcontract an Owner approved fire alarm contractor to put the device(s) or zone(s) affected on bypass. If the building fire alarm devices are addressable, the devices can be bypassed individually. If a building has a "conventional" fire alarm system, the entire zone affected must be bypassed. Under no circumstances is an entire panel to be bypassed.***
 - .3 ***If devices are covered during the Work the Contractor shall follow the manufacturer's recommended procedures. Covers shall be removed at the end of each working day.***

- .4 ***Other activities that generate dust or airborne particulate including spray painting may disturb or actuate fire alarm devices. Such activities may warrant fire alarm bypass and Firewatch procedures.***
- .5 ***During Firewatch, Contractor personnel conducting the watch shall:***
 - .1 ***carry a radio for communication with the Owner's security personnel,***
 - .2 ***remain onsite for the duration of the Firewatch, and***
 - .3 ***tour building areas affected once every hour.***
- .4 ***Once the Firewatch has ended;***
 - .1 ***Owner approved fire alarm contractor to verify the fire alarm system including all devices affected are back online and ensure all "trouble signals" at the fire alarm panel are cleared.***
 - .2 ***Return the radio(s) to the Owner.***
 - .3 ***Once the Work is completed, all devices that were covered are to be re-verified.***
 - .4 ***Notify the Owner the Firewatch has ended.***

3.03 SMOKING

- .1 ***Smoking is at all times be prohibited inside demolition or construction zones in all areas of the Work.***
- .2 ***The Contractor shall post signage indicating the prohibition of smoking in all areas of the Work and shall enforce the no-smoking policy.***
- .3 ***Smoking outside of areas of the Work shall only be permitted in a designated location agreeable to the Owner, but in no case shall be allowed within 9m of any building opening or air intake.***

3.04 HOUSEKEEPING MEASURES

- .1 ***The following housekeeping measures shall be practiced for the duration of the Work, at all times, to limit accumulation of contaminants and debris at the construction site:***
 - .1 ***Maintain a dry, clean workspace throughout construction.***
 - .2 ***The Contractor shall visually inspect job site daily for dust, dirt and water accumulation and take remedial action to correct deficiencies. Increase frequency of cleaning as required to maintain the site in clean and dry condition.***
 - .3 ***Wherever possible, an efficient dust collection method other than dry sweeping shall be used (damp rag, wet mop or vacuum).***
 - .4 ***If dry sweeping is the only alternative, it shall be accompanied by a dust suppression agent. Vacuuming with HEPA filtered vacuum cleaners shall be used to prevent aerosolization of settled dust.***
 - .5 ***Waste products shall be diverted to the appropriate enclosed waste bins or storage areas.***
 - .6 ***Low emitting cleaners shall be used that are certified in accordance with project LEED requirements.***
 - .7 ***All surfaces shall be kept clean, including higher ledges and behind equipment or furniture.***
 - .8 ***Building materials shall be protected from precipitation and other contamination prior to installation. This includes protection of porous materials (i.e. insulation, drywall, and ceiling tile) from exposure to moisture and sources of contamination.***
 - .9 ***Materials shall not be stored directly on the floor. All materials will be elevated by a minimum of 75mm on pallets or by other means.***

- .10 ***Acceptable areas to store the building materials on-site will be identified by the Owner's Project Manager.***
- .11 ***All coils, air filters, fans and duct work will remain clean during the installation and will be cleaned prior to performing testing, adjusting and balancing of systems.***
- .12 ***Any accumulation of water in the building will be immediately removed.***

3.05 SPECIAL CLEANING

- .1 Vacuum clean and remove debris from the inside of air handling systems, fans, ducts, coils and terminal units.
- .2 Clean exposed surfaces of Mechanical equipment, ductwork and piping. Polish plated work.
- .3 Comb all bent fins to proper configuration on all coils in indoor and outdoor air handling units.

3.06 PROTECTION

- .1 ***Protect all Work from damage. All Mechanical Equipment, including existing equipment, shall be protected from exposure to moisture and from collecting dust, debris, odours and other contaminants while demolition and construction activities are ongoing.***
- .2 Cover openings in equipment and cover equipment where damage may occur from weather. Cover temporary openings in ducts and pipes with minimum 6-mil polyethylene sheeting, until final connection is made. Cover all items cast into concrete floors or walls such as floor drains and cleanouts prior to pour, with heavy plastic tape or duct tape.
- .3 ***Protect equipment which may be harmed by excessive dirt with filters, or bypass during cleaning.***
- .4 Cover and seal, with polyethylene sheeting, all equipment, coils and motors in place during construction to prevent entry of dust, paint and debris.
- .5 ***Ductwork Protection:***
 - .1 ***Provide adequate access into ductwork for cleaning purposes.***
 - .2 ***The ends of all ductwork and duct open ends in HVAC equipment are to be sealed tightly, whether they are installed or being stored prior to installation. All ductwork and equipment that is waiting to be installed must be kept off the floor a minimum of 75 mm.***
 - .3 ***Protect equipment which may be harmed by excessive dirt with filters, or bypass during cleaning.***
 - .4 ***Where heavy dust loading is expected to impact operating HVAC systems, higher efficiency MERV 12 filters shall be used to provide increased protection where minimum airflow can be maintained.***
 - .5 ***Equipment filtration shall be replaced immediately prior to occupancy.***
 - .6 ***Upon completion flush-out or successful IAQ testing, HVAC and lighting systems shall be returned to their designed or modified operation.***
 - .7 ***Prior to start-up, the project Architect, Mechanical Designer and/or Commissioning Authority and the Region's Project Manager shall verify that the HVAC systems are free of contamination.***
 - .8 ***If after inspection by the project Consultants, Commissioning Authority or Region Project Manager the ductwork system is deemed to be unacceptable due to construction or demolition activities, the Contractor shall, at its cost and prior to operation or test and balance, clean systems and equipment including but not limited to ductwork (supply/return/exhaust), air handling equipment, plenums, terminal units, fans, dampers, grilles/registers/diffusers with high power vacuum machines.***
- .1 ***At the discretion of the Region's Project Manager, cleaning shall be performed in accordance with National Duct Cleaners Association (NADCA)***

- standards, and by agent specializing in this field of work, and a member in good standing with NADCA.*
- .2 *Submit report, verified by Testing and Balancing Agent, identifying the extent of duct system cleaning and certifying that NADCA standards have been met.*
- .9 **Return/Exhaust Side Protection:**
- .1 *Immediately after installation, the open ends of return and exhaust ductwork shall be sealed with 6-mil polyethylene sheeting.*
- .2 *Where feasible, permanent HVAC equipment shall not be operated during demolition.*
- .3 *If air handlers must be used during demolition or construction, temporary filtration media with a minimum MERV 8 rating shall be used at each return air grille or opening. Filters shall be inspected regularly during demolition and construction and be maintained in good condition. Filters shall be removed prior to occupancy.*
- .4 *Where ceiling cavities are used as return air plenums, replace all missing ceiling tiles and seal all return air grilles and openings.*
- .5 *Mechanical rooms with return-side equipment will not be used to store construction or waste materials.*
- .10 **Supply Side Protection:**
- .1 *HVAC systems in areas where major demolition is scheduled shall be de-energized during the performance of the Work.*
- .2 *Equipment left in place during demolition and construction shall be wrapped in 6-mil polyethylene sheeting.*
- .3 *Where HVAC systems are disabled for the duration of construction, equipment, including VAV boxes, open ductwork, grilles and diffusers installed on the supply side of the HVAC systems shall be sealed with 6- mil polyethylene sheeting following installation.*
- .6 **Porous Building Materials:**
- .1 *Porous building materials, those materials that have pores that may allow fluids or gasses to pass through; this includes drywall, insulation, carpeting, ceiling tiles, and similar.*
- .2 *Porous materials shall be protected from exposure to precipitation, other moisture sources and VOCs contaminants.*
- .3 **Protection measures may include:**
- .1 *Storing the porous products in a location free from moisture and contamination sources prior to installation.*
- .2 *Installing porous products utilizing recommended environmental conditions.*
- .3 *Avoiding installation of products in environments subject to high- VOCs emissions.*
- .4 *Depending on the result of the visual assessment and moisture readings, temporary dehumidification, heating and air circulation equipment may be required in the applicable areas or alternative drying methods may be required to the acceptance of the Consultant and the Owner.*
- .7 **Repair any damage caused by improper protection of equipment and materials.**

3.07 TEMPORARY SERVICES

- .1 Provide temporary mechanical services in accordance with the requirements of Division 01.

- .2 ***Temporary ventilation and heating units shall be used as needed while construction is ongoing.***
- .3 Make arrangements for connections to temporary ***energy sources (electrical power, natural gas, water, drainage and similar) for use by during construction.***
- .4 Provide and maintain temporary fire protection services as required by the Authorities Having Jurisdiction (AHJs).
- .5 When the permanent water service is installed, it shall be used to supply water for the use of other Construction Trade Contractors.
- .6 Perform operations necessary for checking, testing and balancing after written approval is given to start up systems. Ensure that care is taken to protect equipment from damage and to prevent distribution of dust through duct systems.
- .7 ***Do not use permanent plumbing, heating or air conditioning systems for temporary services during construction, except with written permission from Consultant. Permanent HVAC equipment shall not be used to dry out the building materials during, or immediately following, completion of any Work.***

3.08 INTERRUPTION OF EXISTING SERVICES

- .1 Arrange, schedule and perform Demolition Work with minimum disturbance to existing facilities and services.
- .2 Submit a complete schedule of service interruptions and changeovers with approximate dates required, durations and times of day, for approval before proceeding.
- .3 Notify Owner in writing at least 72 hours in advance of planned interruption to existing services.
- .4 Interruption of service must occur at the times and for the duration stipulated by the Owner.
- .5 Keep service interruption duration to an absolute minimum. Carry out all preparatory Work, measurements, performance evaluation, and similar, without interruption of existing services.
- .6 If the Owner requires service interruptions during the night or on weekends, include any premium time in the Bid Price. No extra charges will be allowed at a later date for failure to include for premium time.

3.09 RUN-IN

- .1 Systems shall be run-in, tested and balanced for proper operation prior to application for Substantial Performance of the Work.

3.10 TRIAL USAGE, TESTING AND COMMISSIONING

- .1 Testing shall be performed as required by Codes, Bylaws, and Authorities Having Jurisdiction ("AHJs"); commissioning shall be performed in accordance with Section 20 08 10.
- .2 Perform testing and commissioning as instructed by the Consultant to demonstrate that the work conforms to the contract documents, and where required, perform any additional testing requested by the AHJs.
- .3 Repeat tests as necessary to demonstrate Contract compliance to the satisfaction of the Consultant and the AHJs.
- .4 Include, as part of the Work, trial usage of Mechanical Systems and equipment for the purpose of testing and commissioning, including assistance for the Owner's staff to learn the operation and maintenance procedures, for new equipment and systems.
- .5 Assist in trial usage over a length of time sufficient to confirm specified equipment capacities and operating characteristics.
- .6 Maintain full responsibility for all mechanical equipment and systems required to temporarily operate during trial usage. Warranty period commencement for any equipment operated during trial usage will not occur until certification of Substantial Performance.

3.11 INSTRUCTIONS TO OWNER'S STAFF

- .1 Instruct the Owner's designated staff on all aspects of the operation of systems and equipment. Advise the Consultant at least one week in advance of the schedules of all instruction sessions.
- .2 Obtain the services of Sub-trade and Manufacturers' representatives to provide information and instructions on each part of the Mechanical Work and on items of equipment.
- .3 Submit to the Consultant immediately following final inspections a "Confirmation of Instructions to Owner's Operating and Maintenance Staff" statement for each system or item of equipment confirming:
 - .1 Date and time instructions commenced for each system.
 - .2 Duration (hours) instructions were given for each system.
 - .3 Names of Owner's staff receiving instructions.
 - .4 Other parties present (Manufacturer's representative, consultants, any other project stakeholders).
 - .5 Signatures of each of the Owner's staff in attendance.

- 3.31 DRIP PANS**
- 3.32 MAINTENANCE OF EQUIPMENT PRIOR TO ACCEPTANCE**

PART 1 - GENERAL

1.01 GENERAL REQUIREMENTS

- .1 Comply with requirements of the Owner's General Requirements and all documents referred to therein.
- .2 Comply with requirements of Section 20 01 10 Mechanical General Requirements and all Documents referenced therein.

1.02 SCOPE OF WORK

- .1 Supply required tools and services, and supply and install basic materials with methods required to complete the work.
- .2 Final detailed construction and installation requirements to be responsibility of the Mechanical Trades.
- .3 Manufacturers listed in Sections 20, 21, 22, 23 and 25 are intended to demonstrate the level of quality anticipated for the project and alternative manufacturers of equivalent quality, complying with the fundamental performance requirements and acceptable to the Consultant shall be considered acceptable.

1.03 SUBMITTALS

- .1 Submit shop drawings for the following:
 - .1 access doors,
 - .2 fire stopping,
 - .3 roof curbs;
 - .4 frames and covers,
 - .5 valves,
 - .6 thermometers and gauges,
 - .7 grooved end components
- .2 Provide Submittals for piping anchors prepared and stamped by a professional Structural Engineer registered in the jurisdiction of the Work.
- .3 Submit a letter from pipe anchor design engineer stating engineer has visited the site to examine installation of pipe anchors, and that the pipe anchor installation is in accordance with reviewed pipe anchor Submittal(s).

PART 2 - PRODUCTS

2.01 ACCESS DOORS

- .1 Provide rounded safety corners hinged access doors as constructed of primed 16 gauge steel as manufactured by William Brothers or Acudor equal to fire rating of wall or ceiling in which installed.
- .2 Provide doors with minimum size of 300mm x 300mm (12"x12"). Access doors to be sized of adequate size to permit service of equipment and/or resetting dampers. Provide minimum size of 600mm x 460mm (24" x 18") where personnel entry is required. Provide minimum size of 600mm x 750mm (24" x 30") where personnel entry is required for regular equipment maintenance.
- .3 Provide for plaster surfaces recessed 16 ga. prime painted steel door and welded metal lath, ready to take plaster. Provide with concealed hinge and stainless steel studs with brass sleeves
- .4 Provide for tiled surfaces, recessed type 16 ga. primed steel (stainless steel for ceramic tile and shower areas) doors to suit type and dimension of tile used. Size door to be as close as possible to 300mm x 300mm (12" x 12") by fitting to single or multiple tile dimensions. Provide with concealed hinges and stainless steel studs with brass sleeves.
- .5 Provide, to suit wall surface or type of construction, other factory prime coated access doors of welded 16 gauge steel, flush type with concealed hinges, lock and anchor straps.

- .6 Lay-in type ceiling tiles, properly marked, may serve as access panels.
- .7 Access doors in fire rated construction shall be ULC listed and labelled, meeting the requirements of Authorities having jurisdiction and rated to maintain the fire separation integrity.

2.02 FIRE STOPPING

- .1 Provide ULC listed fire stopping for all Mechanical Work that penetrates a fire rated separation.
- .2 Provide ULC listed fire stopping products by 3M, Hilti or Specified Technologies Inc. which have been tested in accordance with CAN4-S115.

2.03 FLASHING

- .1 Flashing shall be by Mechanical Trades for roof curbs required to suit the Mechanical Work.
- .2 Provide flashing for pipe openings, duct openings, or pre-manufactured roof curbs required for all mechanical systems.
- .3 Provide counter-flashing for roof mounted mechanical equipment and for pipes and ducts passing through roof. Fit counter-flashing over flashing or curb. Pitch pockets are not acceptable.

2.04 ROOF CURBS

- .1 Curbs required for Mechanical Work shall be provided by Mechanical Trades.
- .2 Pre-manufactured curbs for roof mounted mechanical equipment provided by equipment manufacturer shall be installed by Mechanical Trades.
- .3 Provide curbs for roof mounted equipment, around ducts passing through roof and surrounding groups of pipes and/or ducts pass through Service Room floors, Kitchens and similar areas.
- .4 Provide roof curbs of a sufficient height, minimum 18" (450 mm), above finished roof assembly, unless exceeded by Architectural requirements.
- .5 Provide concrete curbs around openings in Service Room floors, extending at least 6" (150 mm) above finished floor. Make watertight connection between curb and floor.

2.05 CONCRETE

- .1 Provide minimum 4" (100 mm) concrete housekeeping pads, unless noted otherwise, complete with reinforcing steel under all floor mounted mechanical equipment and supports. Extend pads over the full equipment base and isolator area.
- .2 Concrete work, including housekeeping pads, required for Mechanical Work shall be provided by Mechanical Trades.
- .3 Provide all concrete required in isolation bases for pumps and fans.
- .4 Provide other concrete work required for Mechanical Work, complete with reinforcing steel.

2.06 FRAMES AND COVERS

- .1 Supply frames for installation by Concrete and Formwork Trades.
- .2 Provide covers for pits and sumps.
- .3 Provide gas tight gaskets for sewage pits.
- .4 Trench gratings will be provided by Mechanical Trades.
- .5 All covers/grates shall be suitable for the traffic loading requirements within space.

2.07 STEEL

- .1 Provide steel required for Mechanical Work not shown on Structural or Architectural Drawings. Provide steel for equipment support, framing, lintels, and other services as required for the installation.
- .2 Provide steel of adequate strength to support equipment and materials during all operating and test conditions. All support steel shall be secured and supported by/from building structure.

- .3 Support suspended equipment from the bottom or from manufacturer's designated suspension points. Support tanks and similar equipment with adequate beam strength by saddles with curvature to match the equipment. Continuously support all other equipment.
- .4 Provide base supports for all pipe risers. Design to distribute operating and static loads.
- .5 Fabricate steel supports in contact with water or humidity conditions from materials having approved corrosion resistance or galvanize after fabrication or brush welds clean and apply a prime coat of rust inhibiting paint.

2.08 HANGERS AND PIPING SUPPORTS

- .1 Pipe hanger and support materials, including accessories, are to be, unless otherwise specified, in accordance with Manufacturers Standardization Society (MSS) Standard Practice Manual SP-58, Pipe hangers and Supports-Materials, Design and Manufacture, and where possible, MSS designations are indicated with each product specified below. Conform to following requirements:
 - .1 unless otherwise specified, ferrous hanger and support products are to be electro-galvanized;
 - .2 hangers and supports for insulated piping are to be sized to fit around insulation and insulation jacket.
- .2 Hangers:
 - .1 Hangers and supports for horizontal suspended piping as follows:
 - .1 adjustable steel clevis hanger – MSS Type 1
 - .2 adjustable swivel ring band hanger – MSS Type 10;
 - .3 equal to Grinnell Fig. 65 for pipe sizes up to and including 65mm (2"); for pipe sizes 75mm (3") and larger, provide adjustable Clevis type equal to Grinnell Fig. 260.
 - .4 Provide Grinnell FM approved Fig. 104 split swivel or Fig. 69 swivel type hangers on fire protection piping.
 - .5 On copper piping, provide copper plated type hanger or separate piping from hanger with an approved insulating plastic coating; tape shall not be considered acceptable.
 - .6 Grinnell adjustable ring type fig. 97 and fig. 97c (coated) are acceptable on copper piping up to 65 mm (2").
 - .7 Provide oversized hangers to pass over insulation on all cold water (chilled water, condenser water, domestic cold water) piping.
 - .2 For hydronic piping carrying fluids at an operating temperature equal to or greater than 167°F (75°C) provide adjustable roller hanger – MSS Types 41, 43, and/or 45, with MSS Type 39 steel protection saddle.
- .3 Piping supports:
 - .1 For pipe risers, provide supports equal to Grinnell Fig. 40, black carbon steel, sized to carry the operating weight of the piping.
 - .2 Supports for horizontal pipe on vertical surfaces as follows:
 - .1 steel offset pipe clamp – Anvil Fig. 103 or Myatt Fig. 170;
 - .2 heavy-duty steel pipe clip – MSS Type 26;
 - .3 single steel pipe hook – Myatt Fig. 156;
 - .4 epoxy coated steel pipe stays are not permitted.
 - .3 Floor supports for vertical risers as follows:
 - .1 copper tubing riser clamp – MSS Type 8;
 - .2 heavy-duty steel riser clamp – MSS Type 8.

- .4 Supports for vertical piping on vertical surfaces as follows:
 - .1 steel offset pipe clamp – Anvil Fig. 103 or Myatt Fig. 170;
 - .2 heavy-duty steel pipe bracket or soil pipe bracket – MSS Type 26;
 - .3 extension split pipe clamp – MSS Type 12;
 - .4 epoxy coated steel pipe stays are not permitted.
- .4 For horizontal pipe on racks, Unistrut or approved equal galvanized steel pipe racks with pipe securing hardware as follows:
 - .1 standard galvanized steel U-bolts/clamps supplied by rack manufacturer;
 - .2 For hydronic heating piping with operating temperatures in excess of 167F (75C) provide adjustable roller chair provide MSS Type 44 with MSS Type 39 steel protection saddle.
- .5 Roof Mounted Piping:
 - .1 For piping on existing roof: Portable Pipe Hangers (Canada) Inc. "PP" Series prefabricated portable pipe support system components to suit pipe, complete with required accessories, and as follows:
 - .1 Use PPH model SS-8R or PP10 with roller for piping up to 2 ½" (65mm) and use model PS-1-2 for pipes over 3" (75mm) and up to 8" (200mm).
 - .2 For refrigeration piping and conduits, use PPH model PS1-2.
 - .3 For pipes over 75mm (3"), use PPH-RB18 with clamps, base and all other applicable support.
 - .4 Support bases to be galvanized structural steel frames, and galvanized steel pipe hangers with stainless steel clamps and rollers.
 - .5 Membrane pads to be close-cell extruded polystyrene insulation equal to Dow Chemical Roofmate.
 - .2 For piping on new roofs: Lexcor "Flash-Tite" or Thaler Roofing Specialties Products Inc. "MERS" Series, insulated aluminum support risers with diameter, height, securement method and flashing to suit the application, channel type aluminum cross members, and galvanized steel pipe hangers and supports conforming to MSS SP-58, complete with required accessories.
 - .3 For roof mounted gas piping: On stable flat bed roof, use pipe supports by Quick Block with oversized stainless steel clamps for roof mounted gas piping up to 125mm (5"). Use PPH-RB18 with rollers and clamps for roof mounted gas piping up to 125mm (5"). Supports for gas piping must be CGA certified & listed and meeting the requirement of gas code B149.1.
- .6 Special hangers and supports for various applications as follows:
 - .1 vibration isolated riser supports: black steel riser clamps as specified above, complete with neoprene–steel–neoprene sandwich type vibration isolation pads between clamp and floor;
 - .2 for groups of pipes having same slope: MSS Type 32 welded steel brackets, Anvil Fig. 46, or approved equal, universal trapeze assemblies, or Unistrut, or approved equal, support assemblies, all with U-bolts, clamps, and ancillaries necessary to secure pipes in place;
 - .3 for sections of piping connected to vibration isolated equipment: hangers and supports as specified above but complete with MSS Type 48 spring cushions;
 - .4 for glass drain and vent piping: special padded hangers supplied by pipe supplier;
 - .5 for plastic piping: generally as specified above but in accordance with pipe manufacturer's recommendations;

- .6 for fire protection piping: generally as above but ULC listed and/or FM approved, and in accordance with Chapter requirements of NFPA Standard(s) applicable to the piping system;
- .7 for bare horizontal copper piping: generally as above but factory vinyl coated to prevent direct copper/steel contact;
- .8 for bare copper vertical piping: corrosion resistant ferrous clamps with flexible rubber gasket type material (not tape) to isolate pipe from clamp;
- .9 insulation protection shields on piping size up to and including 1-½" (40mm): MSS Type 40 galvanized steel shields with ribs to keep shield centred on hanger; piping 2" (50mm) and larger shall be provided with insulation inserts with integral shields.
- .7 Base support for vertical piping risers in excess of 20 ft. (6m) high extending out from floor mounted equipment shall consist of a base elbow support with flange.
- .8 Hanger rods are to be electro-galvanized carbon steel (unless otherwise specified), round, threaded, to ASTM A36, complete with captive machine nuts with washers at hangers, sized to suit loading in accordance with Table 3 in MSS SP-58, but minimum 9.5 mm (3/8") diameter.
- .9 Acceptable manufacturers are:
 - .1 E. Myatt & Co. Inc.;
 - .2 Anvil International Inc.;
 - .3 Empire Industries Inc.;
 - .4 Hunt Manufacturing Ltd.;
 - .5 Unistrut Canada Ltd.;
 - .6 Nibco Inc. "Tolco";
 - .7 Taylor Pipe Supports.

2.09 EQUIPMENT RIGGING SUPPORTS

- .1 Provide eyebolts suitable for block and tackle connection, adequately supported by the structure above for:
 - .1 heat exchanger and shell heads
 - .2 submersible sump pumps
 - .3 pumps in Mechanical Equipment Rooms
 - .4 motors
 - .5 other equipment which will require block and tackle handling

2.10 INSERTS

- .1 Use only factory made, threaded or toggle type inserts as required for supports, and anchors, properly sized for the load to be carried.
- .2 Use factory made expansion shields where inserts cannot be placed, but only as accepted by the Consultant and for light weights.
- .3 Do not use explosive activated tools except with written acceptance of the Consultant.

2.11 PROVISION FOR PIPE EXPANSION, CONTRACTION AND BUILDING SHRINKAGE

- .1 Provide expansion loops and offsets to permit the safe expansion and contraction of piping due to thermal effects, building shrinkage and movement. Where space limitations do not permit the use of expansion loops or offsets, provide Flexonics, or equivalent, expansion joints properly selected for system operating pressures according to the following:
 - .1 For piping up to and including 2-1/2"(65 mm), select ends to suit specified pipe fittings. Pressure ratings for Model H and HB expansion compensated as 200 psi (1400 kPa) and 150 psi (1050 kPa).

- .2 Steel Piping - Flexonics Model H expansion compensator with two ply stainless steel bellows.
- .3 Copper Piping - Flexonics Model HB expansion compensator with two ply bellow, all bronze construction.
- .4 For piping 3" (75 mm) and above, use flanged ends.
- .5 Steel Piping - Flexonics controlled, flexing expansion joint with stainless steel pressure carrier, flanged ends.
- .6 Copper Piping - Flexonics controlled, flexing expansion joint with monel pressure carrier, and brass flanged ends.
- .7 Flexible hose connectors for chilled or heating water shall be Goodyear stainless steel braided rubber hose with crimped on brass ends, 2400 kPa pressure rating, -40°C to 93°C temperature rating, EPDM liner size and length to suit application.
- .8 Flexible hose connectors for glycol media shall be Weatherhead stainless steel braided with smooth bore Teflon hose, complete with crimped on steel hose ends. 2070 kPa pressure rating, -53°C to 230°C temperature rating, size and length to suit application.

2.12 PIPE GUIDES AND ANCHORS

- .1 Refer to Architectural and structural drawings for location of embedments and structural beams required for the support of pipe risers.
- .2 Be responsible for the design and installation of guides and anchors in all vertical and horizontal piping, including hydronic piping, steam and condensate piping, generator exhaust piping and/or breeching, boiler breeching, and similar equipment imposing a dynamic load on the building associated with variations in system temperature.
- .3 Submit to Consultant for review, drawings showing the riser sizes, offsets, location of expansion joints, anchors and guides and other pertinent information. Provide details of the design of riser anchors, guides, attachments and loads imposed on structure. All designs and calculations shall be stamped and sealed by a Professional Engineer retained by the Mechanical Trades.
- .4 The concrete structure will undergo elastic shortening as it is built. Make due allowance for shrinkage of the building. The exact amount is to be determined by the Structural Engineer, and will be approximately 0.3" (8 mm) per floor. Ensure sleeve openings are adequate to accommodate movement and that sufficient resilient packing is left. Ensure that pipe and duct will not shear as a result of shrinkage.
- .5 Mechanical Trades shall review all sleeved penetrations in the core and shall provide a written report testifying that all sleeves and anchorages have provision for shrinkage.
- .6 Pipe Alignment Guides:
 - .1 Provide prime coat painted black carbon steel pipe alignment guides sized and fabricated to suit the pipe size and the pipe insulation thickness.

2.13 SLEEVES, WALL AND FLOOR PLATES

- .1 For pipe sleeves through concrete block and concrete walls and floors, use machine cut and reamed standard weight steel piping.
- .2 Concealed perimeter risers and runouts may have sleeves of {1.31 mm} [18 gauge] galvanized steel set around section of insulation to provide freedom of movement of piping. Extend {50 mm} [2"] above finished floor level.
- .3 For piping through exterior walls, cooperate with the waterproofing trade at all times, and do not break any waterproofing seal without consent of the waterproofing trade. Provide waterproof link seals.
- .4 Provide leak plates where pipe sleeves pass through exterior building walls. Each leak plate shall be a {3.42 mm} [10 gauge] steel plate, welded to the sleeve, {100 mm} [4"] diameter greater than sleeve outside diameter.

- .5 Provide {1.31 mm} [18 gauge] galvanized steel duct sleeves. Provide adequate bracing for support of sleeves during concrete and masonry work. For fire rated floors and walls, build fire damper assemblies into structure to attain fire rated construction, in a manner acceptable to the governing authorities.
- .6 Cover pipe sleeves in walls and ceilings of finished areas, other than Equipment Rooms, with satin finish stainless steel, or satin finish chrome or nickel plated brass escutcheons, with non-ferrous set screws. Do not use stamped steel split plates. Split cast plates with screw locks, however, may be used.
- .7 Cover exposed duct sleeves in finished areas with {1.31 mm} [18 gauge] galvanized steel plates in the form of duct collars. Fix in position with non-ferrous metal screws.

2.14 DRAINS

- .1 Provide NPT 1" (25 mm) minimum size copper pipe drains from overflows, condensate pans and pump bases to floor drains.
- .2 Provide minimum NPT ¾" (20mm) ball valve with hose end adapter, metal cap and chain at all low points of all systems. Locate to allow easy connection of hose.
- .3 Provide NPT 1 ½" (40mm) minimum size drains from ductwork connected to intake hoods and wall louvers. Equip drains with deep seal traps. Locate traps in heated areas.
- .4 Provide NPT ¾" (20mm) valves with metal caps and chains at the base of all pipe risers. Install hose end ball valve in conjunction with 18" (450mm) minimum length full line size dirt leg.

2.15 PRESSURE GAUGES AND THERMOMETERS

- .1 Provide pressure gauges, thermometers and accessories as follows:
 - .1 pressure gauges – No. 600 Series to ANSI Standard B40, Grade A, fully adjustable, 4-1/2" (115 mm) diameter, complete with a cast aluminum casing, clear glass window, white dual scale (psi and kPa) dial, red tipped black pointer, bronze bushed movement, pressure snubber, and "T" handle gauge cock;
 - .2 thermometers – No. BX93403-1/2 CAN/CGSB Standard 14.4-M88 fully adjustable angle, 9" (225 mm) white dual scale (degrees F. and degrees C.), complete with cast aluminum case, clear acrylic window lens, front red reading mercury tubing, separable brass socket, brass piping well, and extension necks where used in insulated pipe or equipment.
- .2 Pressure gauge and thermometer scale ranges shall be such that the working temperature or pressure of the system for which the instrument is provided is at approximately the mid-point of the instrument scale.
- .3 Pressure gauges in steam piping shall be complete with Trerice No. 885 Series coil syphons.
- .4 Pressure gauges in sprinkler and standpipe fire protection piping shall be Winters Model Q1721 or equal ULC listed pressure gauges.
- .5 Pressure gauges in medical gas piping systems shall conform to CSA Z7396.1-12 and shall be identified with the name of the service it is provided for as well as "USE NO OIL".
- .6 Instruments and associated accessories shall be registered with Technical Standards and Safety Authority (TSSA) and shall be complete with a CRN No. Where possible, the CRN No. shall be permanently fixed to the component.
- .7 Provide pressure gauges with cocks in the following locations:
 - .1 in valved tubing across the suction, suction strainer (if applicable), and discharge piping of each circulating pump;
 - .2 in the supply and return piping connections to main heating, cooling and heat recovery coil(s);
 - .3 in the hot side and cold side supply and return piping connections to water and/or glycol solution heat exchangers;
 - .4 in the steam piping connection to steam activated heat exchanger(s);

- .5 in closed expansion tank(s).
- .8 Thermometers in ductwork shall be equipped with Trerice No. 065-0015 or equal mounting flanges.
- .9 Provide an angle type or straight type (as required by the installation) thermometer in the following locations:
 - .1 in the supply and return piping connections to main heating, cooling and heat recovery coil(s);
 - .2 in the hot side and cold side supply and return piping connections to water and/or glycol solution heat exchanger(s);
 - .3 in water or glycol solution supply and return piping connections to steam actuated heat exchanger(s);
 - .4 in supply and return piping connections to domestic hot water heaters;

2.16 PIPE AND DUCTWORK IDENTIFICATION

- .1 Provide pipe markers on all pipe coverings with flow arrow and alternating wording. For outside diameters up to {150 mm} [6"], allow marker to completely wrap pipe. For larger outside diameters, secure markers with stainless steel springs. Secure markers on vertical piping and elsewhere where markers could be inadvertently moved.
- .2 Use stencils and stencil paint on ductwork or ductwork insulation. Apply solid black capitalized lettering {50 mm} [2"] high and solid black flow arrows {150 mm} [6"] long x {50 mm} [2"] wide.
- .3 Locate identification and flow arrows so they can be seen clearly from floor and service platforms as follows:
 - .1 at least once in each room
 - .2 at each piece of equipment
 - .3 at each branch connection close to main piping and ductwork
 - .4 at not greater than intervals of 50 ft (15 meter) on straight runs of exposed piping and ductwork; radioisotope drainage piping and fume exhaust ductwork shall be identified at minimum 3m (10 ft) intervals.
 - .5 at entry and leaving point to pipe and duct chases, or other concealed spaces
 - .6 both sides where piping and ductwork passes through walls, partitions and floors
 - .7 on vertical pipes and ducts approximately 6 ft (1800 mm) above floor
 - .8 behind each access door and panel
 - .9 at valves, identify piping upstream of valves and identify branch, equipment, building part or building serviced downstream of valve
- .4 Colour code pipes to meet code and Owner's requirements. At minimum, colour code pipes with {50 mm} [2"] wide bands.
- .5 Identify electrical tracing of pipes on pipe insulation.
- .6 Provide {40 mm} [1-1/2"] dia., {1 mm} [0.040"] thick brass tags with {10mm} [3/8"] high die-stamped black letters or {10 mm} [3/8"] Lamacoid tags with engraved black.
- .7 Attach to valves with {100 mm} [4"] long brass chains.
- .8 Tag all valves except for small valves isolating a single piece of equipment such as a unit heater, fan coil unit, terminal reheat coil and radiation section.
- .9 of equipment such as a unit heater, fan coil unit, terminal reheat coil and radiation section.

2.17 EQUIPMENT IDENTIFICATION AND NAMEPLATES

- .1 Identify equipment, starters, and, remote control devices in a manner consistent with the Drawings.

- .2 Use solid black capitalized lettering {100 mm} [4"] high.
- .3 Where equipment size does not permit stencil identification, use lamacoid labels, engraved white on black, mechanically fastened to the equipment. Minimum lettering size {10 mm} [3/8"].

2.18 V BELTS

- .1 Fit reinforced toothed belts in sheave matched to drive. Multiple belts on unit to be matched set.
- .2 Use steel sheaves secured to shafts with removable keys.
- .3 For motors 1.3 HP to 10 HP: standard adjustable pitch drive sheaves, having +/-10% range.
- .4 Use mid-position of range for specified r/min.
- .5 For motors over 10 HP: Sheave with split tapered bushing and keyway having fixed pitch unless specifically required for item concerned. Provide sheave of correct size to suit balancing.
- .6 Minimum drive rating: 1.5 times nameplate rating on motor. Keep overhung loads within manufacturer's design requirements on prime mover shafts.
- .7 Motor slide rail adjustment plates to allow for centre-line adjustment and belt tension adjustment.
- .8 Tension belts to manufacturer's recommendations before start up and after the first 100 h of operation using calibrated belt tensioning gauge.
- .9 1 1/2" (38 mm) dia holes on both shaft centres for insertion of tachometer.
- .10 Provide means to permit lubrication and use of test instruments with guards in place.
- .11 Install belt guards to permit movement of motors for adjusting belt tension.
- .12 For flexible couplings, provide removable, "U" shaped, 12 gage (2.7 mm) thick galvanized frame and 18 gage (1.2 mm) thick expanded mesh face.
- .13 Provide 3/4" (19 mm) galvanized mesh wire screen on inlet or outlet of exposed fan blades.
- .14 Provide belt and rotating shaft guards for exposed drives and shafts.
- .15 Acceptable Manufacturer (as listed or equal): Opti-Belt, Goodyear, Gates.

2.19 GUARDS

- .1 All belt guards for remote fans shall be provided with a complete guard which covers the front and back of the belt.
- .2 Provide guards for exposed drives. This includes the drives within the air handling units.
- .3 All guards shall meet the requirements outlined in the OSHA Regulations.
- .4 Guards for drives shall have:
 - .1 Expanded metal screen welded to 1" (25 mm) steel angle frame.
 - .2 18 gauge (1.2 mm) thick galvanized sheet metal tops and bottoms.
 - .3 Removable side for servicing.
 - .4 1 1/2" (40 mm) dia. holes on both shaft centers for insertion of tachometer.
- .5 Provide means to permit lubrication and use of test instruments with guards in place.
- .6 Install belt guards to permit movement of motors for adjusting belt tension.
- .7 Provide 3/4" (20 mm) galvanized mesh wire screen on inlet or outlet of exposed fan blades.

PART 3 - EXECUTION

3.01 INSTALLATION

- .1 Install equipment, ductwork, conduit and piping in a workmanlike manner to present a neat appearance and to function properly to the acceptance of the Consultant. Install ducts and pipes parallel and perpendicular to building planes. Install piping and ductwork concealed in chases, behind furring, or above ceiling. Install exposed systems grouped to present a neat appearance. Comply with manufacturer's installation instructions.

- .2 Install gauges and thermometers to permit easy observance from floor level.
- .3 Install all equipment and apparatus with adequate space allowance for wiring, maintenance, adjustment and eventual replacement.
- .4 Install control devices to guarantee proper sensing. Shield elements from direct radiation and avoid placing them behind obstructions.
- .5 Install equipment in accordance with Manufacturer's requirements. Include all Work shown on shop drawings.
- .6 Install all ceiling mounted components (Diffusers, Grilles, and similar) in accordance with reflected ceiling Drawings.
- .7 Leave space clear and install all work to accommodate future materials and/or equipment and to accommodate equipment and/or materials supplied by other trades. Verify spaces in which work is to be installed. Install pipe and ductwork runs to maintain maximum headroom and clearances and to conserve space in shaft and ceiling spaces.
- .8 Confirm on the site the exact location of equipment and fixtures. Confirm location of equipment supplied by other trades and mechanical requirements thereof.
- .9 Do not suspend any equipment, piping, ducting or any other mechanical components from formed hollow steel decking.

3.02 EQUIPMENT CONNECTIONS

- .1 Install piping connections to pumps and all other equipment without strain at the pipe connections. Remove, where requested by the Consultant, bolts in flanged connections or disconnect piping after the installation is complete to demonstrate that the piping has been so connected.
- .2 Provide shut-off valves on supply and return piping connections on all items of equipment.
- .3 Provide flexible connectors on supply and return piping connections on all based mounted pumps.
- .4 Corrosion Prevention: Install dielectric couplings as specified above at the following locations:
 - .1 Connections to copper/aluminium perimeter convectors, radiant ceiling panels and coils with copper connections in steel piping systems.
 - .2 Connections between copper and steel pipe.
 - .3 Connections to cooling coil condensate drains.
 - .4 Connections to expansion tanks and domestic hot water tanks in copper piping systems.
 - .5 In either steel or copper piping systems, do not put short black steel nipples and individual black steel fittings between brass or bronze components such as valves - use only copper, brass or bronze components. Use a minimum of eight times the mass of steel pipe or components between any two brass, bronze or copper fittings or components.
 - .6 Use brass or bronze valves in a copper or copper alloy piping; do not use copper alloy (brass and bronze) fittings and valves in place of specified dielectric couplings.

3.03 PIPING SYSTEM INSTALLATION

- .1 Install all piping in accordance with the best practices of the trade.
- .2 The piping shown on the drawings is diagrammatic for clearness in indicating the general run and connections and may or may not be, in all instances, shown in its true position. Take responsibility for the proper erection of systems of piping in every respect suitable for the work intended and as described herein.
- .3 Keep plugged or capped all openings in pipe or fittings during installation.
- .4 Install piping to avoid any interference with the installation or removal of equipment, other piping and ducts.
- .5 Install all valves, strainers and specialties to permit easy operation and access.

- .6 Provide means of isolation (shut-off valves or flow balancing valves) for all plumbing and HVAC piping risers, at the base when supplied from the below, or at the top when fed from above.
- .7 On horizontal piping, install valves in an upright position. Where there are space constraints mount valves at a maximum 45° off vertical.
- .8 Install strainers to provide easy strainer basket removal.
- .9 Install systems to provide thorough drainage and air elimination.
- .10 During welding or soldering procedures, provide a fire retardant cloth, mat or blanket to protect the structure, and adequate fire protection equipment at all locations where work is being done. Close off shaft or confined areas with a fire retardant mat or cloth to prevent sparks or pieces of hot metal from falling down the shaft or area way.
- .11 Provide long turn pipe fittings having not less than pipe wall thickness. Provide line size tees. Where branch lines are more than two sizes smaller than the main, weldolets may be used.
- .12 Where it is necessary to offset piping to avoid obstructions, use 45° rather than 90° elbows.
- .13 Provide suitable cleanouts on every other change in direction and slope all condensate drip drains.
- .14 Make all threaded pipe joints on water piping using a thread paste or teflon tape suitable for the service for which the pipe is to be used. Use of hemp or similar materials on threaded joints will not be permitted.
- .15 Comply with manufacturer's installation instructions for all Grooved Couplings and Fittings piping products. Ensure that grooved pipes are in compliance with the current manufacturer's specifications and recommendations.
 - .1 Ensure that the surface area from the pipe end to the front edge of the groove is free from indentations, scores, seams, projections or roll marks.
 - .2 Use only lubricants which are non-toxic and non-injurious to the gasket material.
 - .3 Upon completion of assembly, the bolt pads of each coupling must be fully drawn together, except for Victaulic HP-70 couplings in pipe sizes to 100mm (4").
 - .4 All grooved couplings, fittings, valves, and specialties shall be the products of a single manufacturer. Grooving tools shall be of the same manufacturer as the grooved components.
 - .5 The gasket style and elastomeric material (grade) shall be verified as suitable for the intended service as specified.
 - .6 A factory-trained field representative shall provide on-site training for contractor's field personnel in the proper use of grooving tools and installation of grooved piping products. Factory-trained representative shall periodically review the product installation as requested by the Consultant. Contractor shall remove and replace any improperly installed products.
- .16 Install all piping requiring insulation with sufficient clearance to apply, seal and finish the insulation.
- .17 Provide sufficient space between piping to install valves arranged in straight rows or equally spaced steps. Valve wheels, handles and operators to be easily accessible and operable.
- .18 Do not install horizontal piping within masonry walls. Any piping installed in this manner will not be accepted.
- .19 Use only non-ferrous metals in high humidity areas.

3.04 DRAINS

- .1 Pipe all discharge from relief valves and drains from equipment, outside air plenum/ louver, chemical pot feeders and tanks to nearest floor drain or suitable receptacle.
- .2 Provide 20mm (3/4") ball valves with hose ends, caps and chains at strainers, all piping system low points, pumps, coils and at each piece of equipment.

- .3 Provide deep seal traps (minimum 6" [150mm] trap seal) on all air handling equipment condensate drains and on floor drains located within air handling unit plenums. Provide trap seal primers on all floor drain traps and gang traps.

3.05 CONTROL COMPONENTS

- .1 Install all pipe line devices required by the Section 25 30 10 such as flow switches, valves and submersible wells for temperature controllers and sensors.

3.06 DIRT ACCUMULATION IN CONTROL VALVES

- .1 Remove any dirt accumulated under seats of automatic control valves during the first year's operation. Replace damaged valve parts at no additional cost to the Owner.

3.07 FIELD WELDING

- .1 Only persons holding current welding certificates for the applications required for the Work to be permitted to do any welding. Perform all welding to Standards specified by Authorities Having Jurisdiction. Do not weld to structural members of the building.

3.08 INSTALLATION OF PIPE HANGERS AND SUPPORTS

- .1 Provide all required pipe hangers and supports.
- .2 Provide any additional structural steel channels, angles, inserts, beam champs and similar accessories required for hanging or supporting pipe. Unless otherwise shown or specified, hang or support pipes from structure only.
- .3 Hanger rods may be attached to beam or joist clamps, brackets, or concrete inserts. Explosive actuated tools are not permitted. Do not weld to structural steel unless accepted by the Consultant.
- .4 For insulated pipe, size hanger or support to suit diameter of insulated pipe and install hanger or support on outside of insulation and insulation finish.
- .5 Unless otherwise shown or specified, hang and/or support horizontal pipe above ground by means of hangers and/or supports specified in Part 2 of this Section. Unless otherwise shown or specified, hangers for suspended pipe less than or equal to 25 mm (1") dia. are to be clevis type or adjustable ring type, and hangers for suspended pipe greater than or equal to 40 mm (1½") dia. are to be adjustable clevis type.
- .6 Space hangers and supports in accordance with following:
- .1 cast iron pipe – hang or support at every joint with maximum 2.4 m (8') spacing;
- .2 plastic pipe – conform to pipe manufacturer's recommended support spacing;
- .3 copper and steel pipe – hang or support at spacing in accordance with following Table:

<u>Nominal Pipe Size</u>	<u>Steel Pipe Maximum Support Spacing</u>	<u>Cooper Pipe Maximum Support Spacing</u>
to ¾" (20mm)	7'-0" (2.1m)	5'-0" (1.5m)
1" (25mm)	7'-0" (2.1m)	6'-0" (1.8m)
1-¼" (32mm)	7'-0" (2.1m)	7'-0" (2.1m)
1-½" (40mm)	9'-0" (2.7m)	8'-0" (2.4m)
2" (50mm)	10'-0" (3.0m)	8'-0" (2.4m)
2-½" (65mm)	11'-0" (3.3m)	9'-0" (2.7m)
3" (75mm)	12'-0" (3.6m)	10'-0" (3.0m)
4" (100mm)	14'-0" (4.2m)	12'-0" (3.6m)
6" (150mm)	17'-0" (5.1m)	14'-0" (4.2m)

8" (200mm)	19'-0" (5.6m)	n/a
10" (250mm)	22'-0" (6.7m)	n/a
12" (300mm)	23'-0" (7.0m)	n/a

- .4 flexible grooved pipe/coupling joint piping: in accordance with Table above but with not less than one hanger or support between joints.
- .5 Note that spacing and capacities are based on straight pipe lengths filled with water. Additional valves and fittings increase the load and therefore closer hanger spacing shall be required.
- .7 Where pipes change direction, either horizontally or vertically, provide a hanger or support on horizontal pipe not more than 12" (300mm) from elbow, and where pipes drop from tee branches, support tees in both directions not more than 2" (50mm) on each side of tee.
- .8 When pipes with same slope are grouped and a common hanger or support is used, space hanger or support to suit spacing requirement of smallest pipe in group and secure pipes in place on common hanger or support.
- .9 Provide roller hangers or supports for heat transfer piping greater than or equal to 6" (150mm) diameter and conveying a material 167°F (75°C) or greater to facilitate pipe movement due to expansion and contraction, and at each hanger or support tack weld a steel protection saddle to pipe to protect piping insulation.
- .10 Unless otherwise shown or specified, support vertical piping by means of supports specified in Part 2 of this Section, spaced in accordance with following:
 - .1 support vertical pipes at maximum 10ft. (3m) intervals or at every floor, whichever is lesser;
 - .2 for sections of vertical piping with a length less than 10ft. (3m), support pipe at least once;
 - .3 for vertical cast iron plain end pipe (mechanical joint type), secure riser or pipe clamp around pipe under a flange integral with pipe for vertical support purposes, or provide a length of hub and spigot pipe to facilitate proper support;
 - .4 for vertical steel pipe risers in excess of 10ft. (3m), weld shear lugs to pipe to carry load;
 - .5 for vibration isolated piping risers, provide rubber-steel-rubber vibration isolation pads between riser clamps and floor.
- .11 Support piping on the roof as follows:
 - .1 on existing roof – provide support members as specified in Part 2 of this Section spaced as per schedule above and of a type to suit the application, and, for each support, carefully scrape away roofing gravel, bed support in a heavy covering of roofing mastic, then scrape gravel back up around support and secure pipes to supports;
 - .2 on new roof – supply manufactured roof supports as per Part 2 of this Section to accommodate piping involved and support spacing specified above, and hand supports to roofing trade on roof for installation as part of roofing work, then secure piping in place on supports.
- .12 Each hanger, support or securement for horizontal bare copper tubing is to be plastic coated to prevent direct contact between pipe and ferrous hanger. Each wall or floor clamp for vertical bare copper piping is to be isolated from pipe by means of strips of flexible rubber inserts. Use of painted ferrous hangers and supports, including those painted with copper coloured paint, is not acceptable. Site application of tape or other types of isolation is not acceptable.
- .13 For insulated horizontal piping 1¼" (32mm) and larger, provide galvanized steel insulation protection saddles between insulation and hanger or support in accordance with the following table:

Pipe Insulation Saddle Sizing Tables, Outside Diameter (in.)						
Pipe Size (inches)	Insulation Thickness (in.)					
	½	1	1½	2	2½	3
1¼	3	3½	5	5½	6½	7½
1½	3	4	5	5½	6½	7½
2	3½	4½	5½	6½	7½	8½
2½	4	5	6½	7½	8½	9½
3	4½	5½	6½	7½	8½	9½
4	5½	6½	7½	8½	9½	11
6	7½	8½	9½	11	12	13
8	9½	11	12	13	14	15
10	—	13	14	15	16	17
12	—	15	16	17	18	19
14	—	16	17	18	19	20
16	—	18	19	20	21	22
18	—	20	21	22	23	24

- .1 Saddles up to 5-½" outside diameters shall be 22 gauge galvanized steel, 12" (300mm) long;
- .2 Saddles 6" outside diameter and larger shall be 20 gauge galvanized steel, 18" (450mm) long;
- .3 Install saddles immediately after pipe is insulated.
- .14 Do not support piping from steel deck without written consent from Owner and review with Consultant.

3.09 EXPANSION JOINTS

- .1 Install expansion loops, joints and compensators in accordance with the Drawings and Manufacturer's instructions in regard to proper length, anchoring and guiding, pre-compression, removal of spacers and testing.

3.10 RIGGING AND HOISTING OF EQUIPMENT

- .1 The Contractor shall provide all rigging, hoisting and handling of equipment as necessary in order to place the equipment in the designated area in the building.
- .2 Direct this work by qualified personnel normally engaged in rigging, hoisting and handling of equipment.

3.11 CONCRETE

- .1 Except as specifically indicated on the Mechanical Drawings or where indicated on the Architectural or Structural Drawings as provided by other Sections, provide all concrete work required for mechanical work (bases, curbs, anchors, thrust blocks, manholes, catch basins).
- .2 Provide reinforced concrete housekeeping pads (equipment bases) at least 100 mm (4") high under all floor mounted equipment.

3.12 METALS

- .1 Steel construction required solely for the work of Mechanical trades and not shown on Architectural or Structural Drawings shall be provided by Mechanical Trades to the acceptance of the Consultant. Provide one coat of primer on all steel supports located outdoors.

3.13 CUTTING AND PATCHING

- .1 Provide all cutting and patching of building finishes as necessary to complete the Work.
- .2 Obtain the Owner's written approval for locations and methods before starting to cut openings in load bearing members.
- .3 Provide all cutting and patching for services penetrating walls, floors and roofs as shown on the Drawings. Cut only to suit dimensions required and for minimum clearances.
- .4 Include for x-ray of slab to determine the location of reinforcing steel prior to drilling.
- .5 Seal around services passing through cut openings with materials commensurate with the fire rating of the wall, floor or roof.
- .6 Ensure sealing is weatherproof for openings through exterior walls and roofs. Before sealing, provide prime coat of paint on all repaired surfaces.
- .7 Finish all cutting and patching work to match base building finishes and make invisible.

3.14 LINTELS

- .1 Lintels for openings in masonry to conform to requirements given on structural drawings and as required by By-laws.
- .2 Pay all costs for lintels over openings required solely by the mechanical trades.

3.15 INSERTS, SLEEVES AND ESCUTCHEONS

- .1 Provide all sleeves required for ductwork, piping and access openings unless they are specifically shown on Architectural and Structural Drawings.
- .2 Place inserts only in portion of the main structure and not in any finishing material.
- .3 Supply and locate all inserts, holes, anchor bolts and sleeves in time when walls, floors and roof are erected.
- .4 Provide the following for pipe sleeves:
 - .1 Through interior walls, exterior walls above grade, interior non waterproof floors: Machine cut schedule 40 steel pipe, medium cast iron or 18 gauge galvanized steel.
- .5 Seal all sleeves as follows:
 - .1 Through fire rated walls and floors and within mechanical assemblies (ducts): Stop insulation flush with all wall and floor surfaces and seal space between duct or pipe and sleeve with ULC approved and listed fire stopping material as manufactured by Double AD Distributors Ltd. (416) 292-2361 or M. W. McGill and Associates Ltd. "Fire-Bloc" (416) 291-8393 or Dow RTV Silicon Foam or "Metacaulk" as distributed by EMCO Ltd. (416) 742-6220].
 - .2 Through all non-fire rated walls and floors stop insulation, where applicable, at wall and floor surfaces. Ram-pack ULC labelled mineral wool materials around piping and ductwork. Apply an approved caulking compound over the ram packed material on both sides.
- .6 Cover sleeves and openings around exposed piping in all finished areas with chrome plated escutcheons. Cover exposed duct sleeves in finished areas with an 18 gauge galvanized steel collar fixed to wall or floor.

3.16 FIRE STOPPING

- .1 Mechanical service penetrations of required fire separations shall be fire stopped using ULC listed fire stopping products that have been tested in accordance with CAN4-S115.
- .2 Provide all fire stopping affected by the Mechanical Work to maintain required listed ratings of fire separations.

3.17 ACCESS PANELS AND DOORS

- .1 Install all concealed Mechanical equipment requiring adjustment or maintenance in locations easily accessible through access panels and doors. Install systems and components to result in a minimum number of access panels.
- .2 Access doors are required in walls, ceilings and ductwork for the following:
 - .1 Fire dampers and motorized dampers (for inspection, repair and resetting). Provide access doors on both upstream and downstream sides of automatic dampers.
 - .2 Duct mounted coils (duct access upstream and downstream sides for cleaning).
 - .3 Duct mounted smoke detectors (for inspection of in-duct sensors).
 - .4 Control valves and temperature control components.
- .3 Indicate access panels on "As built" drawings and note at each location the items (i.e. equipment or valve no.) that access is being provided for.
- .4 Size access doors to provide adequate access and be commensurate with type of structure and architectural finish.
- .5 Ensure proper rating of doors in fire separations.
- .6 Provide lamacoid labels (white on black), screwed in place, on all access doors and access tiles listing items or equipment which access is being provided for.

3.18 EXPOSED WORK

- .1 Wherever any mechanical work (plumbing, drainage, hydronic and sprinkler piping, ductwork, and associated thermal insulation) is exposed in finished areas, co-ordinate the work with the Consultant prior to installation. If unsatisfactory installation results due to not following this procedure, perform remedial work to the Consultant's acceptance.
- .2 For purposes of the foregoing, finished areas do not include equipment rooms.

3.19 PIPING SYSTEM TESTS

- .1 Do not insulate piping systems until completed, perfected, and proven tight.
- .2 Should leaks develop in any part of the piping system, remove and replace defective sections, fittings and equipment.
- .3 Test piping system in sections as required by the progress of work.
- .4 Test all heating water and domestic water piping hydraulically to a minimum pressure of 1100 kPa (150 psi) or 1.5 times the normal working pressure, whichever is the greater, and prove tight for a period of 8 hours. Testing with nitrogen is also acceptable provided a pressure of 1.25 times values specified previously is used. Test natural gas piping as required by Code and Authorities Having Jurisdiction.
- .5 All plumbing, heating and cooling mains and branches are to be flushed and cleaned without fixtures and appliances connected.
- .6 All tests must be recorded. Submit recorded data to the Consultant.

3.20 PROVISION FOR PIPE EXPANSION, CONTRACTION AND BUILDING SHRINKAGE

- .1 Make provision for pipe expansion, contraction and building shrinkage with suitable anchors, offsets or expansion loops. Where space limitations do not permit the use of expansion loops or offsets, provide expansion joints properly selected for system operating pressures. Standard grooved joint fittings shall not be used for expansion/contraction\ compensating purposes.
- .2 Install piping to allow freedom of movement in all planes without imposing undue stress on any section of main piping, branch piping, equipment or structure.
- .3 Install expansion joints in accordance with manufacturer's published instructions.

3.21 PIPE GUIDES AND ANCHORS

- .1 Provide expansion compensators (including expansion loops) in the piping where required. Design and install guides and anchors in all vertical and horizontal piping that will be subject to movement of any kind due to any cause.
- .2 Provide pipe alignment guides where required, including double guides at each side of expansion loops and/or compensators, according manufacturer's published recommendations. Use at least two guides on each side of expansion joint.
- .3 Install pipe guides for expansion joints. Install manufactured or field fabricated alignment guides to allow movement in axial direction only.
- .4 Where guides are provided on cold piping, provide thermal break to prevent sweating.
- .5 Secure engineered anchors to the structure to secure pipework where required. Avoid introduction of excessive reactive forces and operating weights into the structure and onto equipment and piping. Anchors shall be in accordance with reviewed shop drawings.
- .6 Install vertical risers properly anchored and guided to maintain accurate vertical position of piping. At time of startup, clean and lubricate guides, and adjust to allow free sliding at operating conditions.

3.22 PAINTING

- .1 Paint all ferrous metal work except piping, galvanized and stainless steel ductwork, with one factory prime coat, or paint one prime coat on site.
- .2 Clean and steel brush surfaces with welds. Then prime coat all steel supports and brackets.
- .3 On uninsulated piping, steel brush and prime coat welds.
- .4 Touch-up or repaint surfaces damaged during shipment or installation and leave ready for finish painting.
- .5 Prime coat material shall conform to Canadian General Standards Board Standard No. 1-GP-48.
- .6 Finish painting will be provided by Painting Trades.

3.23 IDENTIFICATION OF MECHANICAL SERVICES

- .1 Identify all mechanical services after finish painting is complete.
- .2 Use terminology consistent:
 - .1 with the Drawings and Specifications
 - .2 with the Owner's requirements and standards.
- .3 Identify lay-in type acoustic ceilings used for access to equipment and components by a method acceptable to Consultant.
- .4 Mark valve and equipment identification on Record Drawings.
- .5 Provide typewritten master lists for each Equipment Room. Frame under glass. Insert copies in Operating and Maintenance Instruction Manuals.

3.24 IDENTIFICATION OF PIPING AND PIPELINE EQUIPMENT

- .1 Identify all automatic control devices and motor driven equipment with 3mm (1/4") lamacoid plastic plates with beveled edges having engraved white letter on black background giving the nature of equipment service and its number, i.e. "Washroom Exhaust E1", "Condenser Pump P1" Fix to equipment using sheet metal screws.
- .2 Also provide:
 - .1 12mm (1/2") lettering for motor starters and 75mm (3") lettering for equipment.
 - .2 Where equipment is locally switched (e.g. Room exhaust fans) provide identification plate at switch.
- .3 Co-ordinate with BAS Trades and obtain list of automatically operated equipment and provide warning identification on lamacoid plate for each item as follows:

- .1 "Warning: This equipment may start at any time. Do not service without disconnecting power."
- .4 Provide all major valves with brass or plated plastic numbered tags, 18mm (3/4") diameter with stamped numbers. Secure by brass chains to the valve. Valves adjacent to plumbing fixtures, convectors, unit heaters and entrance heaters need not be tagged. Prepare an approved list detailing the valve location, tag numbers and purpose. Mount one (1) copy of this list in a glazed frame where advised by the Owner and provide additional copies for the manuals.
- .5 Identify the following piping as to service and direction of flow using stencils and black lettering behind each access door, in each room, and/or every 12m (40 ft.)
 - .1 Domestic (potable) water: hot, cold, recirculation
 - .2 Hydronic piping system: chilled water supply and return, chilled glycol supply and return, heating water supply and return, heating glycol supply and return.

3.25 FLASHING AND COUNTER-FLASHING

- .1 Provide flashing for pipe openings or pre-manufactured roof curbs.
- .2 Provide counter-flashing for roof mounted mechanical equipment and for pipes and ducts passing through roof. Fit counter-flashing over flashing or curb. Pitch pockets are not acceptable.

3.26 CURBS

- .1 Ensure that curbs are provided for mechanical work where required.
- .2 Provide curbs for roof mounted equipment, around ducts passing through roof and surrounding groups of pipes and/or ducts passing through equipment room floors, kitchens and similar areas.
- .3 Select curb heights to prevent water leakage or weather penetration around the mechanical services surrounded by the curb.

3.27 METAL FRAMES AND COVERS

- .1 Covers and frames for pits and sumps shall be designed, fabricated and installed to readily permit full access to the concealed services, to resist superimposed loading, and to be gas tight where odours may be present.
- .2 Installation to ensure that covers and grates are flush with finished floors.

3.28 STEEL

- .1 Provide steel of adequate strength to support equipment and materials during all operating and test conditions.
- .2 Support suspended equipment from the bottom or from manufacturer's designated suspension points. Support tanks and similar equipment with adequate beam strength by saddles with curvature to match the equipment. Continuously support other equipment.
- .3 Provide base supports for all pipe risers. Design to distribute operating and static loads.
- .4 Fabricate steel supports in contact with water or humidity conditions from materials having approved corrosion resistance or galvanize after fabrication or brush welds clean and apply a prime coat of rust inhibiting paint.

3.29 EQUIPMENT BASES AND SUPPORTS

- .1 Unless otherwise specified or required, set all floor mounted equipment on minimum 4" (100 mm) high reinforced concrete housekeeping pads 8" (200 mm) clear of the equipment on each side and end, or a minimum of 8" (200 mm) from the centreline of equipment anchor bolts to the edge of the base, whichever is larger. Conform to the following requirements:
 - .1 supply dimensioned drawings and equipment base templates, and provide anchor bolts for proper setting and securing of equipment on pads;
 - .2 place anchor bolts during the concrete pour and be responsible for all required levelling, alignment, and grouting of the equipment;

- .3 as a minimum, use wire mesh reinforcement, however, for pads for large heavy equipment, use reinforcement as per structural drawing details.
- .2 For equipment not designed for base mounting, where required, provide welded, cleaned and prime coat painted structural steel stands or supports conforming to the following requirements:
 - .1 all stands and supports, except those for small equipment, are to be designed by a structural engineer registered in the jurisdiction of the work, and stamped and signed design drawings with calculations are to be submitted as shop drawings for review;
 - .2 all steel stands are to be flange bolted to concrete housekeeping pads;
 - .3 all stands and supports are to be seismically restrained in accordance with applicable requirements.

3.30 WELDING AND BRAZING

- .1 All welding and brazing shall conform to the following codes and standards:
 - .1 Building Services Piping Code ANSI/ASME B 31.9 (latest edition)
 - .2 CSA B51 (latest edition), Boiler, Pressure Vessel and Pressure Piping Code
 - .3 ASME Boiler Code - Section IX
 - .4 All requirements of the Technical Standards and Safety Authority (TSSA)
- .2 Welding shall conform to a welding procedure which must be in accordance with TSSA requirements and include materials, weld preparation, heat treatment and welding equipment to be used.
- .3 Qualify welders according to ASME equivalent testing procedures. Do not use welders, on or off site work who are not qualified for the work. Maintain records for all qualification testing, and provide copies to the Consultant on request.
- .4 Identify work in accordance with codes and standards. Welds shall be full penetration, continuous and without defects. After deposition, each layer of weld shall be cleaned to remove slag and scale by wire brushing or grinding, then chipped where necessary to prepare for proper deposition of the next layer. The weld reinforcement shall not be less than 1/16" (1.6 mm) and not more than 1/8" (3.2 mm) above the normal surface of the joined sections. The reinforcement shall be crowned at the centre and shall merge into the base material without excessive shoulder or undercut.
- .5 Welding shall be made by machine or manual shielded metallic arc process. Direct current shall be used exclusively with the base material on the negative side of the line. Electrodes used shall be an approved all position rod type.
- .6 Provide a copy of TSSA registration and include with Maintenance Manuals.

3.31 DRIP PANS

- .1 Route piping to avoid running over critical spaces unless the piping system serves the respective area. Critical spaces shall include, but not be limited to, critical care areas, procedure rooms, recovery rooms, areas containing expensive medical or computer equipment, and food preparation areas.
- .2 Where such critical and sensitive areas cannot be avoided, plan the installation to minimize the number of joints required, and locate potential failure points in less sensitive locations. Use welded or soldered joints over critical spaces.
- .3 Provide drip pans under piping running over critical spaces.
- .4 Drip pans shall be constructed of galvanized steel or stainless steel sheet, and shall be complete with drain connections.
- .5 Slope pan to ensure positive and complete drainage to the drain connection point, and pipe the drain to a local indirect termination.
- .6 Each drip pan shall extend beyond the edge of the piping it serves by a minimum of 75 mm and shall be configured to have at least a 50 mm high lip.

- .7 Drip pans shall not obstruct access to piping protected or other services installed above.

3.32 MAINTENANCE OF EQUIPMENT PRIOR TO ACCEPTANCE

- .1 Maintain all equipment in accordance with the manufacturer's printed instructions prior to start-up, testing and commissioning.
- .2 Employ a qualified millwright to check and align shafts, drives, and couplings on all base mounted split coupled motor driven equipment.
- .3 Where equipment lubrication fittings are not easily accessible, extend the fittings to accessible locations using copper or aluminum tubing.
- .4 All filters shall be new upon Substantial Performance of the work. This is in addition to any spare filters specified.

PART 3 - EXECUTION

- 3.01 GENERAL INSTRUCTIONS**
- 3.02 DISPOSAL OF MATERIALS**
- 3.03 PROTECTION OF OWNERS PREMISES**
- 3.04 RESTRICTION ON USE OF PREMISES**
- 3.05 PREPARATION**
- 3.06 INTERRUPTION OF EXISTING SERVICES**
- 3.07 SALVAGED ITEMS**

PART 1 - GENERAL

1.01 GENERAL REQUIREMENTS

- .1 Comply with requirements of the Owner's General Requirements and all documents referred to therein.
- .2 Comply with requirements of Section 20 01 10 Mechanical General Requirements.
- .3 Comply with requirements of Section 20 01 50 Basic Materials and Methods.

PART 2 - PRODUCTS

2.01 NIL

PART 3 - EXECUTION

3.01 GENERAL INSTRUCTIONS

- .1 Refer to Drawings for extent of demolition work. The drawings indicate the approximate locations of services as far as these are known.
- .2 Dispose, off site, of all debris in accordance with the Authorities having Jurisdiction (AHJs).
- .3 Removal and storage of salvageable items will be as directed by this Specification Section and the Owner or their representative.
- .4 At the end of each work shift, leave work in a safe condition.
- .5 Patch fire rated partitions and floors to maintain rating upon removal of mechanical services originally spanning fire rated assembly.
- .6 Demolish work into sections of practical size for removal without alteration or damage to existing building.
- .7 Unless noted otherwise include with the demolition scope all control devices and sensors, including control wiring and/ or pneumatic tubing, associated with equipment indicated as being demolished. This includes, but is not limited to:
 - .1 Space temperature and humidity sensors;
 - .2 Duct mounted temperature, flow and humidity sensors;
 - .3 Piping temperature, and flow sensors (sensing wells to remain where piping is not intended for demolition).

3.02 DISPOSAL OF MATERIALS

- .1 All materials which have not been designated for salvage from the demolition shall become the property of the Contractor. Remove all material and debris from the site as quickly as possible and dispose of legally. Burning of debris or selling of materials on the site will not be permitted.
- .2 Present to the Owner existing equipment removed but not identified for salvage on site. Acceptance of removed equipment is at the discretion of the Owner. Remove such items from site when deemed unsuitable.
- .3 Conform to requirements of municipality's Works Department regarding disposal of waste materials.
- .4 Materials prohibited from municipality waste management facilities shall be removed from site and disposed to recycling companies specializing in recyclable materials.

3.03 PROTECTION OF OWNERS PREMISES

- .1 Adhere strictly to the Owner's requirements.
- .2 Confer with the Owner concerning schedule, dust and noise control prior to commencing Demolition Work in or adjacent to existing facilities where such Demolition Work might affect either those facilities or their occupants.
- .3 Execute Demolition Work with least possible interference or disturbance to occupants, public and normal use of premises.
- .4 Provide temporary means to maintain security when security has been reduced by Demolition Work.

- .5 Only elevators, dumbwaiters, conveyors or escalators assigned for Contractor's use may be used for moving Trades and material within building. Protect walls of passenger elevators, to approval of Owner prior to use. Accept liability for damage, safety of equipment and overloading of existing equipment.
- .6 Provide temporary dust screens, barriers, warning signs in locations where renovations and alternation work is adjacent to areas which will remain functional during Demolition Work.
- .7 All mechanical systems indicated to remain shall be protected from damage.
- .8 Provide and maintain ready access to fire-fighting equipment at all times.
- .9 Provide and maintain proper and suitable fire extinguishers throughout the duration of the Demolition Work.
- .10 The drawings indicate the approximate locations of services as far as these are known. Should any service line be broken, or disrupted by Demolition Work specified under this Contract, repair service lines, and make good all damage due to the disruption or break, at no expense to the Owner. Notify the Owner immediately whenever any service line is broken or damaged.
- .11 The drawings indicate the approximate locations of services as far as these are known. Immediately advise Consultant in writing when unknown services are encountered.
- .12 Accept liability for costs incurred by the Owner in repairing and cleaning equipment, or other building finishes or services resulting from failure to comply with the requirements of these Specifications.

3.04 RESTRICTION ON USE OF PREMISES

- .1 Use only those existing entrances and stairs designated by the Owner for access to and egress from the existing buildings and various floors where work of this contract is to be carried out. No traffic through other areas of the building will be permitted without the prior consent of the Owner.
- .2 Keep stairs and corridors clear and open as required by the Ontario Fire Code ("OFC") and the Authorities Having Jurisdiction ("AHJs") for exiting purposes in case of fire, and as required for use by the Owner's personnel.
- .3 Owner will designate which toilet facilities may be used by Mechanical Division Trades.

3.05 PREPARATION

- .1 Notify the consultant a minimum of 48 hours prior to commencing Demolition Work.
- .2 Prior to commencing Demolition Work arrange to have the appropriate Trades concerned present for the disconnection of all building services.
- .3 Ensure that all existing services designated to remain are adequately protected.

3.06 INTERRUPTION OF EXISTING SERVICES

- .1 Arrange, schedule and perform Demolition Work with minimum disturbance to existing facilities and services.
- .2 Submit a complete schedule of service interruptions and changeovers with approximate dates required, durations and times of day, for approval before proceeding.
- .3 Notify Owner in writing at least 72 hours in advance of planned interruption to existing services.
- .4 Interruption of service must occur at the times and for the duration stipulated by the Owner.
- .5 Keep service interruption duration to an absolute minimum. Carry out all preparatory Work, measurements, performance evaluation, and similar, without interruption of existing services.
- .6 If the Owner requires service interruptions during the night or on weekends, include any premium time in the Bid Price. No extra charges will be allowed at a later date for failure to include for premium time.

3.07 SALVAGED ITEMS

- .1 The following items included in the demolition scope are to be turned over to the Owner:
 - .1 None

CONTENTS

PART 1 - GENERAL

- 1.01 GENERAL REQUIREMENTS**
- 1.02 WORK INCLUDED**
- 1.03 SUBMITTALS**
- 1.04 WORK IN EXISTING BUILDING**

PART 2 - PRODUCTS

- 2.01 NIL**

PART 3 - EXECUTION

- 3.01 FIRE PROTECTION SERVICES TO BE MAINTAINED**
- 3.02 PLUMBING AND DRAINAGE SERVICES TO BE MAINTAINED**
- 3.03 HVAC SERVICES TO BE MAINTAINED**
- 3.04 CONTROLS AND BAS SERVICES TO BE MAINTAINED**

PART 1 - GENERAL

1.01 GENERAL REQUIREMENTS

- .1 Comply with requirements of the Owner's General Requirements and all documents referred to therein.
- .2 Comply with requirements of Section 20 01 10 Mechanical General Requirements.
- .3 Comply with requirements of Section 20 01 50 Basic Materials and Methods.
- .4 Comply with requirements of Section 20 05 05 Mechanical Demolition.

1.02 WORK INCLUDED

- .1 Planning and phasing of construction activities that allow for the continued operation of the facility, or designated areas of the facility, during the construction period, including, but not necessarily limited to:
 - .1 Limitations on access to areas of the site,
 - .2 Limitations on use of the site,
 - .3 Coordination with site personnel,
 - .4 Maintenance of identified existing mechanical services during construction, or construction related activities, under control of the Contractor.

1.03 SUBMITTALS

- .1 Submit a Work Plan identifying how existing mechanical services identified to be maintained during construction activities are intended to continue in operation unless approved as part of a pre-planned scheduled service disruption. The Work Plan will address the following:
 - .1 Services being disrupted,
 - .2 Anticipated start of disruption, length of disruption, and date when mechanical services are anticipated to be re-established,
 - .3 Mechanical services in the operational areas of the facility outside of the construction site that will be affected during the service disruption,
 - .4 How the mechanical service, or portion of the mechanical service, will be maintained during construction activities, or construction related activities, under control of the Contractor,
 - .5 The Contractor's plan for remedial work to reestablish any required mechanical services to be maintained, but disrupted because of construction related activities, regardless of the effort to maintain the mechanical services intended by the Work Plan.
- .2 Carefully schedule all disruption and/or shutdowns and ensure that the duration of same is kept to the absolute minimum.
- .3 The Contractor shall not execute any work on site until the Work Plan has been submitted and reviewed by the Owner.

1.04 WORK IN EXISTING BUILDING

- .1 Areas of the facility identified in the Documents shall remain open and in operation during construction, or construction related activities under the control of the Contractor.
- .2 The existing building is to remain online and operational unless a service disruption is required to complete the work, and only then at a time and duration agreed to by the Owner. Where existing services such as water, drainage, fire protection, natural gas, heating, cooling, exhaust, make-up (ventilation) air, stand-alone controls, the Building Automation System (BAS) elements, and other similar mechanical services are required to be maintained during construction, the Contractor shall coordinate any required service shut-downs with the Owner as identified in the Work Plan and carry out the work at a time and in a manner acceptable to them.
- .3 Where disruption to life safety systems are required, provide a Fire Watch in accordance with Section 20 01 10 during the service shut down period and ensure that all systems are reactivated prior to leaving site at the end of each working day.

- .4 Should any temporary connections be required to maintain services during work in the existing building, supply and install all necessary material and equipment and provide all labour at no extra cost. Should any existing system be damaged, make full repairs, without additional cost, to the satisfaction of the Consultant.
- .5 Refer to Owner's General Requirements and Division 01 for phasing and staging of work and adhere to those requirements. Comply with instructions regarding working hours to maintain the building in operation.
- .6 The drawings indicating items of equipment to be deleted or relocated have been prepared as a guideline for the Contractor but shall not be construed as indicating every item of equipment or ancillary device. Be responsible for determining site conditions by personal examination prior to any service shutdown.
- .7 Where existing services mounted on, and/or concealed behind, existing finishes become exposed during the work and where these services are required to remain but will no longer be concealed behind or mounted on new finishes as part of the work, identify the services to the Consultant. Co-ordinate new service locations or means to conceal these services with the Consultant.

PART 2 - PRODUCTS

2.01 NIL

PART 3 - EXECUTION

3.01 FIRE PROTECTION SERVICES TO BE MAINTAINED

- .1 During construction the following Fire Protection Services are to be maintained:
 - .1 Fire extinguishers inside the wash bays and services are to remain in place.

3.02 PLUMBING AND DRAINAGE SERVICES TO BE MAINTAINED

- .1 During construction the following Plumbing and Drainage Services are to be maintained:
 - .1 Potable water supply to the building, including UV filtration and water softening equipment to maintain functionality of the wash bays and service bays is to remain operational,
 - .2 Floor drains and below grade sanitary drainage serving the wash bays and service bays, and related trap seal primer and venting systems are to remain operational,
 - .3 Wash bay and service bay roof drainage is to remain operational.
 - .4 Natural gas service to radiant heating system is to remain operational.
 - .5 Air compressor serving compressed air distribution piping in wash bay and service bay to remain operational.

3.03 HVAC SERVICES TO BE MAINTAINED

- .1 During construction the following Heating, Ventilation and Air-Conditioning (HVAC) Services are to be maintained:
 - .1 Wash bay and service bay exhaust fans are to remain operational.
 - .2 Wash bay and service bay make-up air intake louvers and dampers are to remain operational.
 - .3 Natural gas radiant heating serving the wash bays and service bays are to remain operational.
- .2 Where natural gas radiant heating in the wash bays and service bays cannot be maintained due to scheduled demolition of other services, provide temporary propane heaters in the wash bays and service bays in lieu of existing radiant heaters.

3.04 CONTROLS AND BAS SERVICES TO BE MAINTAINED

- .1 During construction the following Controls and Building Automation System (BAS) Services are to be maintained:
 - .1 Controls related to the wash bay and service bay exhaust fans, and make-up air dampers.

- .2 Controls related to the wash bay and service bay space heating.
- .3 Remote BAS monitoring and control of the following buildings on site, but unrelated to the construction:
 - .1 Existing salt storage building.
 - .2 Grey water system control panel monitoring and controlling storage tank and pumps adjacent to salt storage building.
 - .3 Existing sheds (four total, refer to site plan for location)

PART 1 - GENERAL

- 1.01 GENERAL REQUIREMENTS**
- 1.02 SCOPE OF WORK**
- 1.03 QUALITY ASSURANCE**
- 1.04 REFERENCE CODES AND STANDARDS**
- 1.05 SUBMITTALS**
- 1.06 SITE VISIT**

PART 2 - PRODUCTS

- 2.01 ELECTRIC HEATING CABLE**
- 2.02 SYSTEM CONTROL**
- 2.03 ELECTRIC HEAT TRACING FOR FIRE PROTECTION SYSTEMS**

PART 3 - EXECUTION

- 3.01 GENERAL**
- 3.02 INSTALLATION**
- 3.03 TESTS**
- 3.04 PIPING SYSTEMS WHICH REQUIRE HEAT TRACING AND INSULATION**

PART 1 - GENERAL

1.01 GENERAL REQUIREMENTS

- .1 Comply with requirements of the Owner's General Requirements and all documents referred to therein.
- .2 Comply with requirements of Section 20 01 10 Mechanical General Requirements.
- .3 Comply with requirements of Section 20 01 50 Basic Materials and Methods.

1.02 SCOPE OF WORK

- .1 Provision of electric heat tracing systems and equipment heating cables, components and controls to prevent pipelines from freezing as described in this Section.
- .1 Coordinate with the Electrical Trades all systems, equipment and devices.

1.03 QUALITY ASSURANCE

- .1 Electrical heat tracing work shall be performed by a qualified licensed electrician.
- .2 Unless stated otherwise, all electric heat tracing products, materials and equipment shall be ULC listed and ETL approved.

1.04 REFERENCE CODES AND STANDARDS

- .1 Comply with applicable Codes and Standards including the following:
 - .1 Requirements of the Authorities Having Jurisdiction ("AHJs").
 - .2 The Ontario Building Code ("OBC").
 - .3 The Ontario Electrical Safety Code ("OESC")
 - .4 Requirements of the Owner's Insurer.

1.05 SUBMITTALS

- .1 Submit fire protection system shop drawings to the regulatory authority for review and approval prior to submitting to the Design Consultant. Conform to the following requirements:
 - .1 submit shop drawings for all products specified.

1.06 SITE VISIT

- .1 Visit the site prior to tender and verify all conditions. Prior to submitting price, the Mechanical Division Trade Contractor is to review all discrepancies and verify the locations of all existing services that are being extended, and the routing of new services.
- .2 Report all ambiguities, discrepancies, departures from building by-laws and/or from good practice. Failure to do so will result in all additional costs being the responsibility of the Mechanical Division Trade Contractor.
- .3 Include for any alternate routing of new or rerouting of existing services to accommodate all site conditions in the tender price.

PART 2 - PRODUCTS

2.01 ELECTRIC HEATING CABLE

- .1 The specifications are based on Raychem XL-Trace System.
- .2 Provide self-regulating heating cable consisting of two (2) 16 AWG tinned-copper bus wires embedded in parallel in a self-regulating polymer core that varies its power output to respond to temperature all along its length, allowing the heating cable to be cut to length in the field.
- .3 The heating cable shall be covered by a radiation-crosslinked, modified polyolefin dielectric jacket with a braid of tinned-copper and an outer jacket of modified polyolefin (CR) as required by the electrical code.

- .4 Provide heating cable with self-regulating factor of at least 90 percent. The self-regulation factor is defined as the percentage reduction, without thermostatic control, of the heating cable output going from 40°F pipe temperature operation to 150°F pipe temperature operation.
- .5 The heating cable shall operate on line voltages of 120 and/or 208 volts without the use of transformers.
- .6 The heating cable shall be sized according to the table below. The required heating cable output rating is in watts per foot at 50°F. Heating cable selection is based on 1" fiberglass insulation on metal piping.

Pipe Size (in.)	Minimum Ambient Conditions (- 10°F)
3 in or less	5 watts
4 in	5 watts
6 in	8 watts
8 in	2 strips – 5 watts
12 in to 14 in	2 strips – 8 watts

- .7 Provide power connection, end seal, splice and feed kit components to be applied in the field.
- .8 Heating cable circuit shall be protected by a ground fault device for equipment protection. Coordinate breaker requirements with Division 26.

2.02 SYSTEM CONTROL

- .1 The system shall be controlled by a line sensing thermostat AMC-1A set at 40°F either directly or through an appropriate contactor.

2.03 ELECTRIC HEAT TRACING FOR FIRE PROTECTION SYSTEMS

- .1 Electric heat tracing used for fire protection system piping shall include supervision at the building fire alarm system for the following:
 - .1 Ground fault
 - .2 Low system temperature
 - .3 High system temperature
 - .4 Temperature sensor failure
 - .5 Primary controller failure
 - .6 Electrical continuity
 - .7 Loss of incoming supply voltage
 - .8 Engagement of secondary controller

PART 3 - EXECUTION

3.01 GENERAL

- .1 All wiring and conduit installation shall conform to governing Codes and Standards and shall be inspected, as required, by the Authorities Having Jurisdiction ("AHJ's). Make any corrections to the Work to comply with the requirements of the AHJ's in order to obtain approval for the Work.
- .2 Install all wire and conduit in a neat and secure manner in such a way that it is protected from damage, is not in conflict with mechanical or architectural components and allows for future changes and additions.
- .3 Provide wiring for electrical heat tracing systems to achieve a fully operational system as intended by the design.
- .4 Provide all required interlock connections, relays and control wiring.
- .5 Provide complete wiring diagrams of all circuits.

- .6 Identify all conduits, raceways, and junction boxes using colour bands. Colouring scheme shall be Owner's standard.
- .7 Identify system voltage, phase, neutral and grounding of all junction boxes, conduits and wiring.

3.02 INSTALLATION

- .1 Comply with manufacturer's written recommendations or specifications, including product technical bulletins, handling, storage and installation instructions, and datasheet.
- .2 Prior to installation of heating cable system, verify that all piping which will be heat trace has passed all hydrostatic/pressure test and is signed off by the Consultant.
- .3 Secure the heating cable to piping with cable ties or fiberglass tape.
- .4 Prior to installing heating cable on the piping an insulation resistance test shall be performed by the installing contractor to ensure integrity of heating cable as describe in the installation & maintenance manual.
- .5 All heating cable ends shall be protected from moisture ingress until cable is terminated.
- .6 All heat tracing components including power connections, splices, tees, crosses or end seal must be installed above grade and protected from abuse or damage; electrical connections are not permitted to be installed below grade.
- .7 Contractor to furnish & install a 1" plastic conduit to six (6) o'clock position on the below ground water piping as a raceway for the heating cable to the electoral heat traced piping below grade. Conduit sweep shall be clamped to the piping as indicated on the drawings.
- .8 Heating Cable shall be installed in the six (6) o'clock position on all of the below ground, water piping.
- .9 Contractor to furnish & install ¾" plastic conduit from controller to the below ground, hydronic piping as a raceway for the temperature sensor. Conduit shall be strapped to the twelve (12) o'clock position/top of the water piping, extend a distance of 2'-0" on top of the pipe and sealed with a closed end cap as indicated on drawings.
- .10 Temperature sensor shall be installed inside of ¾" plastic conduit and pushed all the way to the closed end. Contractor to wire temperature sensor to C910-485 controller and be responsible for extended temperature sensor wiring as required by the site conditions.
- .11 Install electric heating cable according to the drawings and the manufacturer's instructions. The installer shall be responsible for providing a complete functional system, installed in accordance with applicable national and local requirements.
- .12 Apply "Electric Traced" signs to the outside of the thermal insulation.
- .13 For heat tracing for fire protection piping, all products shall be ULC listed and FM approved meeting the requirements of applicable NFPA Standards.

3.03 TESTS

- .1 After installation and before and after installing the thermal insulation, subject heating cable testing using a 2500 Vdc Megger. Minimum insulation resistance shall be 20 to 1000 megohms regardless of length.

3.04 PIPING SYSTEMS WHICH REQUIRE HEAT TRACING AND INSULATION

- .1 Unless noted otherwise, provide electric heat tracing for piping subject to freezing. Piping located in an unheated or partially heated parking garage is considered as area subject to freezing.
- .2 Refer to the following table for piping systems which require heat tracing.

Piping System	Heat Trace	Insulation
Fire Protection – Sprinkler and Standpipe Systems:		
Drum Drips	Yes ⁽¹⁾	Yes
Drainage Systems:		
Sanitary	No ⁽²⁾	Yes
Notes:		
.1 Heat tracing used for fire protection system to be UL and ULC listed and FM approved meeting the requirements of NFPA 13 and 14 and the Owner's Insurer.		
.2 Sanitary P-traps, and sanitary drainage piping 10 ft (3m) downstream of P-trap, are required to be heat traced and insulated in unheated spaces.

CONTENTS

PART 1 - GENERAL

- 1.01 GENERAL REQUIREMENTS**
- 1.02 SCOPE OF WORK**
- 1.03 SUBMITTALS**
- 1.04 QUALITY CONTROL**
- 1.05 VIBRATION ISOLATION GENERAL REQUIREMENTS**

PART 2 - PRODUCTS

- 2.01 VIBRATION ISOLATION**

PART 3 - EXECUTION

- 3.01 VIBRATION ISOLATION INSTALLATION**

PART 1 - GENERAL

1.01 GENERAL REQUIREMENTS

- .1 Comply with requirements of the Owner's General Requirements and all documents referred to therein.
- .2 Comply with requirements of Section 20 01 10 Mechanical General Requirements.
- .3 Comply with requirements of Section 20 10 50 Basic Materials and Methods.

1.02 SCOPE OF WORK

- .1 Supply labour and materials required to isolate motor driven mechanical equipment as indicated on the drawings and specified herein, and guarantee the function of the materials and equipment supplied.
- .2 Supply labour and materials required to isolate piping systems connected to motor driven equipment.

1.03 SUBMITTALS

- .1 Submit shop drawings for all Vibration Isolation products Specified in this section of the Specifications.

1.04 QUALITY CONTROL

- .1 All vibration isolators and bases shall be supplied by an approved supplier with the exception of isolators which are factory installed and are standard equipment with the machinery.
- .2 Provide shop and placement drawings for all vibration isolation elements for review, before materials are ordered. The drawings shall bear the stamp and signature of the responsible supplier's technical representative.
- .3 The work shall be carried out in accordance with the specification and, where applicable, in accordance with the manufacturer's instructions and only by workmen experienced in this type of work.

1.05 VIBRATION ISOLATION GENERAL REQUIREMENTS

- .1 All vibration isolators shall have either known undeflected heights or other markings so that after adjustment, when carrying their load, the deflection under load can be verified thus determining the load is within the proper range of the device and that the correct degree of vibration isolation is being provided according to the design.
- .2 All isolators shall operate in the linear portion of their load versus deflection curve. Load versus deflection curves shall be furnished by the manufacturer and shall be linear over a deflection range of 50 percent above the design deflection.
- .3 The ratio of lateral to vertical stiffness shall not be less than 1.0 or greater than 2.0.

PART 2 - PRODUCTS

2.01 VIBRATION ISOLATION

- .1 General:
 - .1 The static deflection of isolators shall be given in the equipment schedule and as specified.
 - .2 Vibration isolator sizes and layout shall be determined by the vibration isolator supplier.
 - .3 All mechanical equipment not specifically identified in this specification that contains rotating or vibrating elements shall be installed on Type P1 isolators.
 - .4 Elastomeric elements that will be exposed to temperatures below freezing shall be fabricated from natural rubber instead of neoprene.
 - .5 All isolators to be installed outdoors or exposed to weather shall be hot dipped galvanized and shall be furnished with neoprene mounting sleeves for hold-down bolts to prevent any metal to metal contact.

- .6 Acceptable Manufacturer (All vibration isolators) (as listed or equal): Mason, Vibro-Acoustics, Vibron, Amber Booth
- .7 Model numbers for Mason isolators are indicated for reference purposes.
- .2 Elastomeric Pads
 - .1 Type P1 - neoprene waffle or ribbed; 5/16" (9 mm) minimum thick; 50 durometer; maximum loading 50 psi (350 kPa). Mason type W
 - .2 Type P2 - rubber waffle or ribbed; 5/16" (9 mm) minimum thick; 30 durometer natural rubber; maximum loading 60 psi (415 kPa). Mason type W.
 - .3 Type P3 - neoprene-steel-neoprene; 5/16" (9 mm) minimum thick neoprene bonded to 16 gage (1.71 mm) steel plate; 50 durometer neoprene, waffle or ribbed; holes sleeved with isolation washers. Mason type WSW.
 - .4 Type P4 - rubber-steel-rubber; 5/16" (9 mm) minimum thick rubber bonded to 16 gage (1.71 mm) steel plate; 30 durometer natural rubber, waffle or ribbed; holes sleeved with isolation washers. Mason type WSW
 - .5 Pads to be selected for 15% strain.
- .3 Elastomeric Mounts:
 - .1 Type M1 - color coded; neoprene in shear; laterally stable maximum durometer of 60; threaded insert and two bolt-down holes; ribbed top and bottom surfaces. All metal surfaces to be covered with neoprene. Mounts shall have leveling bolts rigidly secured to the equipment. Mason type ND.
 - .2 Pads to be selected for 15% strain.
- .4 Isolator Springs:
 - .1 Design stable springs so that ratio of lateral to axial stiffness is equal to or greater than 1.2 times the ratio of static deflection to working height. Select for 50% travel beyond rated load. Units to be complete with leveling devices.
 - .2 Cadmium plate for outdoor and internal air handling installations.
 - .3 Color code springs. The spring diameter shall be not less than 80% of the compressed height of the spring.
 - .4 Unless otherwise specified, the minimum static deflection for equipment mounted on grade slabs shall be 1" (25 mm) and the minimum static deflection for equipment mounted above the lowest level shall be 2" (50 mm).
 - .5 Two isolation pads sandwiching a 16 gage (1.71 mm) steel plate shall be bonded to the isolator base plate.
 - .6 Unless otherwise specified, isolators need not be bolted to the floor for indoor installations. If the base plates are bolted to the structure, a neoprene vibration isolation washer and sleeve shall be installed under the bolt head between the steel washer and the base plate.
- .5 Spring Mounts:
 - .1 Zinc or cadmium plated hardware; housings coated with rust resistant paint.
 - .2 Type M2 - stable open spring: support on bonded 1/4" (6 mm) minimum thick ribbed neoprene or rubber friction and acoustic pad. Mason type SLF.
 - .3 Type M3 - stable open spring: 1/4" (6 mm) minimum thick ribbed neoprene or rubber friction and acoustic pad, bonded under isolator and on isolator top plate; internal adjustment; equipment bolting not necessary. Mason type SLF.
 - .4 Type M4 - restrained stable open spring: supported on bonded 1/4" (6 mm) minimum thick ribbed neoprene or rubber friction and acoustic pad; built-in resilient limit stops, removable spacer plates. Minimum clearance of 1" (25 mm) shall be maintained around restraining boots and between the housing and the spring so as not to interfere with the spring operation. Limit stops shall be out of contact during normal operation, backed away from

- contact by at least 1/2" (12 mm); a neoprene washer shall be installed beneath the bolt head/washer used to restrain the isolator. Mason type SLR.
- .5 Type M5 - enclosed spring mounts with snubbers for isolation up to 51 lbs (23 kg) maximum.
 - .6 Spring Hangers:
 - .1 Color coded springs, rust resistant, painted box type hangers. Swivel arrangement to permit hanger box or rod to move through a 30° arc without metal to metal contact.
 - .2 Unless specified otherwise, the static deflection shall be 3/8" (9 mm), with a strain not exceeding 15%, and spring hangers to have minimum static deflection of 2" (50 mm).
 - .3 A neoprene sleeve shall be provided where the lower hanger rod passes through the steel hanger box such that the hanger rod cannot contact the steel hanger. The diameter of the clear hole in the hanger box shall be at least 3/8" (19 mm) larger than the diameter of the hanger rod.
 - .4 Type H1 - neoprene - in-shear. Mason type HD
 - .5 Type H2 - stable spring, elastomeric washer. Mason type 30
 - .6 Type H3 - stable spring, elastomeric element. Mason type 30N
 - .7 Riser Guide:
 - .1 For vertical isolated piping, riser guides shall be M-1 type isolators bolted to the vertical edge of a 90 degree steel angle. The angle shall allow the pipe to move axially but shall limit lateral movement to approximately +/- 1" (25 mm).
 - .8 Inertia Base Forms
 - .1 Type B1 - Full depth perimeter structural or formed channels, frames: welded in place reinforcing rods running in both directions; provide metal pans integrally welded on sizes up to 8 feet (2400 mm) on smallest dimension, bolted on sizes over 8 feet (2400 mm) on smallest dimension; spring mounted units carried by gusseted height saving brackets welded to frame; and clear housekeeping pads by 2" (50 mm) minimum.
 - .2 Mechanical Contractor to provide concrete in accordance with section 20 05 10.
 - .3 Minimum thickness of isolation base forms to be in accordance with the following schedule.

Motor Size (HP)	Minimum Thickness (in.)
3 - 9	6
10 - 24	8
25 - 74	10

PART 3 - EXECUTION

3.01 VIBRATION ISOLATION INSTALLATION

- .1 Provide vibration isolation for new equipment as noted in the specification, listed in the schedule and shown on the drawings.
- .2 Install vibration isolation equipment in accordance with manufacturer's instructions and adjust mountings to level equipment.
- .3 Ensure piping, ducting and electrical connections to isolated equipment do not reduce system flexibility.
- .4 Ensure that piping and ducting passage through walls and floors do not transmit vibrations. A minimum of 1" (25 mm) clearance shall be allowed around the entire perimeter of the penetration. The clearance shall be packed with fibreglass and sealed with non-hardening mastic on both sides.

- .5 Unless indicated otherwise, support piping connected to isolated equipment with spring mounts or spring hangers with 1" (25 mm) minimum static deflection as follows:
 - .1 Up to NPS 4: first 3 points of support.
 - .2 First point of support shall have a static deflection of twice deflection of isolated equipment, but not more than 2" (50 mm).
- .6 Unless specified otherwise, isolators indoors need not be bolted to the floor. Where isolation is bolted to floor avoid short circuiting of sound pads by using vibration isolation rubber washers.
- .7 Provide suitable supports for all equipment which does not have a frame with adequate rigidity.
- .8 All steel bases shall clear the sub-bases by at least 2" (50 mm). All bases shall be blocked and shimmed level so that all ductwork and piping connections can be made to a rigid system, at operating level, before the isolation adjustment is made. The clearance shall be checked by the contractor to ensure that no scraps have been left to short circuit the vibration isolators.
- .9 There shall be a minimum of 4" (100 mm) clearance between isolated equipment and the walls, ceiling, floors, columns and any other equipment not installed on vibration isolators.
- .10 Piping, ductwork, conduit or mechanical equipment shall not be hung from or supported on other equipment, pipes or ductwork installed on vibration isolators. It shall be supported on or suspended from building structure.
- .11 Equipment connected to fluid piping shall be erected on isolators or isolated foundations at correct operating heights prior to connection of piping. Equipment should be blocked-up with temporary shims to final operating height. When the system is assembled and fluid is added, the isolators shall be adjusted to allow removal of the shims, and the Contractor shall confirm that the isolators for the fluid-filled pipes, pumps and other elements deflect the specified amounts and no more.
- .12 All wiring connections to mechanical equipment on isolators shall be made in a 360-degree loop: minimum conduit length: 3-ft (1 m). Cut any ties used to install this loop prior to adjusting the isolators.
- .13 Isolation Within Mechanical Room:
 - .1 Within the mechanical rooms, all equipment, piping and ductwork below DI department shall be suspended, supported and guided within the mechanical room by means or appropriate spring vibration isolators as described below and in the schedule. This includes ductwork, domestic water, heating, steam and chilled water/glycol pipes, etc. The only exclusion is fire protection piping. Pipes shall be supported by Type M3 or hung from the structure on Type H3 hangers (see Item 3 below).
 - .2 Piping in the mechanical equipment room that is connected only to machinery installed on neoprene isolators shall be either supported from the floor on Type M1 mounts or suspended from the structure on Type H1 hangers (see Item 3 below).
 - .3 Areas where only floor supports and spring mounts must be used or areas where spring hangers can be used are identified on the attached sketches.
- .14 Where a pipe run connects multiple items of equipment in the mechanical from the pipe isolators for the entire run shall be chosen to suit the connected equipment of greatest static deflection.

- 2.03 WIRING**
- 2.04 CONDUIT**
- 2.05 PULLBOXES AND JUNCTION BOXES**

PART 3 - EXECUTION

- 3.01 GENERAL INSTALLATION REQUIREMENTS**
- 3.02 INSTALLATION OF ELECTRIC WIRING**
- 3.03 INSTALLATION OF CONDUIT**
- 3.04 INSTALLATION OF PULLBOXES AND JUNCTION BOXES**
- 3.05 DOCUMENTATION AND SYSTEMS ACCEPTANCE**

PART 1 - GENERAL

1.01 GENERAL REQUIREMENTS

- .1 Comply with requirements of the Owner's General Requirements and all documents referred to therein.
- .2 Comply with requirements of Section 20 01 10 Mechanical General Requirements.
- .3 Comply with requirements of Section 20 01 50 Basic Materials and Methods.

1.02 SCOPE OF WORK

- .1 Electrical materials, equipment and installation procedures shall conform to Ontario Electrical Safety Code as amended to date.
- .2 Provide all required motors, starters, motor control centres, contactors, disconnect switches, and control devices for the Mechanical Division of the Work.
- .3 Provide electric power wiring in conduit for equipment (connection of motors through starters and disconnects) provided as part of the Work.
- .4 Provide motor control wiring in conduit (at any required voltage) between starter panels and control components to achieve all performance requirements specified.
- .5 Provide all required power, control and communication wiring in conduits for items supplied by equipment manufacturers such as high level alarms, low water cut-offs, anti-vibration lock-outs, flow switches, remote and local temperature and humidity sensors, sump pump alternators, level controllers, water treatment equipment, and control wiring between starters and control panels.
- .6 Provide all required power, control and communication wiring in conduit for interface panels and sensors.
- .7 Provide all required power, control and communication wiring in conduit required for project. All wiring in connection with the control system shall be provided by the BAS Trades.
- .8 Provide control and communication wiring between Cooling Tower VFD and Cooling Plant Control System.
- .9 Provide control and communication wiring between Chillers and Cooling Plant Control System.
- .10 Provide control and communication wiring between Boilers and Boiler Sequencing Panel.
- .11 Provide power, control and communication wiring in conduit between cooling tower level control sensor and make-up water automatic control valve.
- .12 Provide protected (fire rated) control and communication wiring between fire pump automatic transfer switch (ATS) and emergency power generator control panel.
- .13 Coordinate with the Electrical Trades all systems, equipment and devices provided for the Mechanical Division of the Work.

1.03 REFERENCE CODES AND STANDARDS

- .1 Comply with applicable Codes and Standards including the following:
 - .1 Requirements of the Authorities Having Jurisdiction ("AHJs").
 - .2 The Ontario Building Code ("OBC").
 - .3 The Ontario Electrical Safety Code ("OESC")
 - .4 CAN/ULC-S524 - "Standard for the Installation of Fire Alarm Systems"
 - .5 Requirements of the Owner's Insurer.

1.04 SUBMITTALS

- .1 Submit shop drawings for all Motors, Motor Starters, and Motor Control Centers ("MCCs").
- .2 Submit a colour code for input/output point wiring, communication buses, and power wiring.

PART 2 - PRODUCTS

2.01 ELECTRIC MOTORS

- .1 CSA labelled, and except where specifically noted.
- .2 Unless noted otherwise, all motors ½ HP rated capacity and smaller shall be 120 volt, single phase, 60 cycles.
- .3 Unless noted otherwise, all motors ¾ HP up to and including 1½ HP rated capacity shall be 208 volt, 3 phase, 60 cycles.
- .4 Unless noted otherwise, all motors 2 HP rated capacity and larger shall be 600 volt, 3 phase, 60 cycles.
- .5 Refer Mechanical Equipment Schedules for exact details. Motors to meet NEMA standards for maximum sound level ratings under full load. Service factor on all motors to be 1.15.
- .6 Motor bearings: to be permanently lubricated ball type for motors up to and including 5 HP. Bearings for all motors over 5 HP to be self-aligning greaseable ball bearings sized to provide life of at least 50,000 hours L-10 life under belt driven service.
- .7 Single Phase Motors: Provide permanent split capacitor type.
- .8 Motors 20 HP and larger provide thermistor over temperature protection for each winding, wire in series, with leads terminated in the motor junction box.
- .9 Unless noted otherwise, all motors over 1/3 HP to be Open Drip Proof (“ODP”).
- .10 All motors over 1 HP to be high efficiency type with ratings based on statistically valid Quality Control procedures conforming to ANSI/IEEE 112 (Ref. 10), Test Method B (dynamometer), using NEMA MG1 (MG1-12.54 and MG1-12.55) (Ref.11), and conforming to efficiency ratings as defined in Table 10.4.1.A (a) under SB-10 of Ontario Building Code. Motors to be approved under the Canadian Electrical Safety Code.
- .11 Motors used in applications where Variable Frequency Drives (VFDs) are employed shall be complete with:
 - .1 motor winding insulation suitable for the intended application, and
 - .2 motor bearing protection rings (motor bearing grounding rings), to redirect stray shaft currents to the motor frame bypassing the motor bearings.
- .12 Acceptable electric motor manufacturers: WEG, US Motors, Westinghouse, General Electric, Baldor-Reliance, Brook-Crompton, Marathon

2.02 MOTOR STARTERS

- .1 Provide combination starters for all motors that are not already controlled by variable frequency drive (“VFD”), or have been included as an integral part of manufacturer’s packaged equipment.
- .2 Motor starters to be capable of starting associated motors under imposed loads. Confirm starter voltage matches motor prior to ordering.
- .3 Unless noted otherwise, all motor starters shall be complete with the following:
 - .1 Surface or recessed enclosure to suit application;
 - .2 Hand-Off-Auto (HOA) switch capable of receiving remote enabling signal from Building Automation System (BAS) in the Auto position;
 - .3 LED pilot lights;
 - .4 Integral control power transformer;
 - .5 Sufficient control terminal contacts, Normally Open (NO) and Normally Closed (NC), to achieve requirements outlined in the Control Sequences;
 - .6 Minimum two auxiliary contacts (1 x NO, 1 x NC) in addition to control terminal contacts described above;
 - .7 Reset push button;
 - .8 Capacity to apply physical lock-out capability.

- .4 In addition to the above, and unless noted otherwise, starters for fan motors shall be complete with the following:
 - .1 Fire Alarm Emergency Shut-down input to disable the starter from energizing the motor in either Hand or Auto mode.
 - .2 Firefighter's override operation that, when activated, will take priority over the Fire Alarm Emergency Shut-down and energize the motor in any mode (Hand, Off or Auto) regardless of other inputs or lack of inputs either manual or auto.
- .5 Unless otherwise specified, starters for 1-phase motors are to be 115 volt, thermal overload protected manual starting switches.
- .6 Unless otherwise specified, starters for 3-phase motors less than 50 HP are to be combination "quick-make" and "quick-break" fused disconnects and full voltage non-reversing across-the-line starters, each complete with overload relay per phase, and accessories in accordance with motor starter schedule.
- .7 Unless otherwise specified, starters for 3-phase motors 50 HP to 150 HP are to be reduced voltage, non-reversing, auto-transformer type starters each complete with one overload relay per phase, through door disconnect, and accessories in accordance with motor starter schedule.
- .8 Unless otherwise specified, starters for 3-phase motors 150 HP and larger are to be reduced voltage, non-reversing, closed transition "wye-delta" starters each complete with one overload relay per phase, through door disconnect, and accessories in accordance with motor starter schedule.
- .9 Starters for 2-speed double winding motors are to be generally as specified above but suitable for motor and equipped with adjustable 60 second time delay to permit equipment to coast down to low speed before it is operated at low speed.
- .10 Starters for 2-speed single winding motors are to be generally as specified above but suitable for motor and equipped with adjustable 60 second time delay to permit equipment to coast down to low speed before it is operated at low speed.
- .11 Starters for reversible motors for cooling towers are to be generally as specified above but suitable for motor and equipped with adjustable 60 second time delay to allow fan(s) to coast down to stop before being operated in reverse rotation.
- .12 Unless otherwise specified, motor starter enclosures are to be in accordance with following NEMA ratings:
 - .1 enclosures located in sprinklered areas – Type 2;
 - .2 enclosures exposed to the elements – Type 3R, constructed of stainless steel;
 - .3 enclosures inside the building in areas subject – Type 3R, constructed of stainless steel;
 - .4 enclosures in explosion rated area – Type 7 with exact requirements to suit the area and application;
 - .5 enclosures except as noted above – Type 1;
 - .6 enclosures located in finished areas – as above but recess type with brushed stainless steel faceplate.
- .13 Fuses are to be, unless otherwise scheduled or specified, English Electric Ltd. HRC fuses, Form I Class "J" for constant running equipment and Form II Class "C" for equipment that cycles on and off.
- .14 Acceptable manufacturers are:
 - .1 Rockwell Automation Inc. - Allen-Bradley;
 - .2 Eaton;
 - .3 Siemens Canada;
 - .4 Schneider Electric.

2.03 WIRING

- .1 "RW90" single copper conductors to CSA C22.2 No. 38, 90 degrees C. X-link polyethylene insulated, colour coded.
- .2 "T90 Nylon", single copper conductor to CSA C22.2 No. 75, 600 volts, 90 degrees C rated, PVC insulated, nylon covered.
- .3 "RWU90" single copper conductor to CSA C22.2 No. 38, 1000 volts, maximum 90°C conductor temperature, -40°C minimum installation temperature, extra thickness X-link polyethylene (XLPE) insulation suitable for wet and buried installations, colour coded.
- .4 "TWU" single copper conductor to CSA C22.2 No. 75, colour coded, -40 °C rated, PVC insulated.
- .5 "AC-90" flexible armoured cable to CSA C22.2 No. 51 (R2004), with "RW-90" conductors and bare copper ground conductor.
- .6 "MI" two (2) hour fire rated, specifically ULC listed and labelled as fire resistive cabling, copper sheathed, copper conductor, mineral insulated cable.
- .7 Wiring Connectors:
 - .1 Armoured cable connectors to be proper squeeze type connectors and plastic anti-short bushings at terminations.
 - .2 Connectors for wire in conduit to be minimum 600 volts rated pressure type connectors.
 - .3 Connectors for main feeders to be two hole, long barrel, double crimp compression lugs.
 - .4 Lugs shall be copper.

2.04 CONDUIT

- .1 EMT (galvanized electrical metallic tubing) to CSA C22.2 No. 83. Install in climate controlled areas within ceiling spaces, wall spaces or surface mounted in non-finished areas.
- .2 Rigid galvanized steel to CSA C22.2 No. 45. Install in non-climate controlled areas, surface mounted, at heights subject to
- .3 Aluminum flex or galvanized steel liquid-tight metallic conduit to CSA C22.2 No. 56.
- .4 Rigid plastic conduit (PVC).

2.05 PULLBOXES AND JUNCTION BOXES

- .1 Galvanized or prime coat plated steel, suitable in all respects for the application and complete with screw-on or hinged covers as required, and connectors suitable for connected conduit.
- .2 Threaded cast Feraloy outlet boxes of an exact type to suit the application, each complete with screw-on gasketed cover.
- .3 Rigid plastic (PVC), junction boxes, and access fittings with solvent weld type joints and screw-on PVC covers.

PART 3 - EXECUTION

3.01 GENERAL INSTALLATION REQUIREMENTS

- .1 All wiring and conduit installation shall conform to governing Codes and Standards and shall be inspected, as required, by the Authorities Having Jurisdiction (AHJ's). Make any corrections to the Work to comply with the requirements of the AHJ's in order to obtain approval for the Work.
- .2 Install equipment, conduit and cables in a workmanlike manner to present a neat appearance to function properly to the satisfaction of the Consultant.
- .3 Replace work unsatisfactory to the Authorities Having Jurisdiction (AHJ's) and/or the Consultant without extra cost.
- .4 Protect from damage all equipment delivered to the site and during installation. Any damage or marking of finished surfaces shall be made good to the satisfaction of the Consultant.

- .5 Install all wire and conduit in a neat and secure manner in such a way that it is protected from damage, is not in conflict with mechanical or architectural components and allows for future changes and additions.
- .6 Install equipment and apparatus requiring maintenance, adjustment or eventual replacement with due allowance therefore.
- .7 Make provision to accommodate future plant and equipment indicated on drawings.
- .8 Install runs parallel and perpendicular to building lines, in chases, behind furring or above ceilings, where such concealment is possible. In areas where systems are to be exposed install neatly and group to present a tidy appearance.
- .9 Provide power wiring for mechanical equipment, controls and where ever required to achieve a fully operational system as intended by the design.
- .10 Provide control wiring for all equipment provided or supplied as part of the Mechanical Division of the Work.
- .11 Provide all interlock connections and relays.
- .12 Provide complete wiring diagrams of all controls and pilot circuits.
- .13 Identify all conduits, raceways, pull boxes, and junction boxes using colour bands. Colouring scheme shall be Owner's standard.
- .14 Identify system voltage, phase, neutral and grounding of all pull boxes, junction boxes, conduits and wiring.

3.02 INSTALLATION OF ELECTRIC WIRING

- .1 Provide all required wiring and conductors unless otherwise specified or required, wiring from panel boards to wiring devices shall be sized for a 2% voltage drop. Bus bars, cables and wires shall be copper.
- .2 Where allowed, exposed wire shall consist of a minimum FT6 rated, Teflon covered cable and limited to distances as specified by the applicable Codes within individual fire compartment areas.
- .3 Ceiling space return air plenums shall contain no exposed wiring of any type.
- .4 Wiring joints shall contain no more than three wires of gauges within one size range apart. Mechanically crimp all joints. The use of "marrett" type connectors are restricted for joining two wires maximum of equal AWG and type only.
- .5 Cable ties shall be used to secure wire at equal distances and neatly trimmed according to manufacturers' recommendations. Black colour ties are required in non-conditioned areas of the building.
- .6 Separate all wiring for systems of different voltages and from different sources and do not run in common raceways. Maintain adequate shielding and separation between wiring for power and communication systems to prevent interference.
- .7 No two wires within common conduit systems shall be of the same colour unless they are similar, i.e. Whites for neutral power.
- .8 Use wiring methods, materials and devices that result in a safe, reliable and flexible electrical power, communication, data, and life safety system.
- .9 Colour code conductors throughout to identify phases, neutrals and ground by means of self-laminating coloured tape, coloured conductor insulation;
- .10 All control wiring must be identified with self-sticking wire markers, indicating I/O channels at panels, pull boxes, junction boxes, equipment and similar locations.
- .11 Install individual ground conductor in each conduit and/or raceway.
- .12 Provide Pyrotenax "MI" fire rated cable in accordance with OBC for power wiring and control wiring connected to designated Life Safety equipment. Wiring located only within the fire compartment where the equipment is located need not be fire rated.

- .13 Provide power, lighting, Building Automation System (BAS), high voltage distribution and other electrical wiring systems with unique colours in accordance with the Owner's colouring scheme. Major colour to be 100 mm wide and minor colour to be 50 mm wide.
- .14 Upon completion of the installation and prior to energization of components and systems, perform a complete inspection and testing to verify phase and polarity match of feeders with equipment and the tightness of power wiring terminations.

3.03 INSTALLATION OF CONDUIT

- .1 Install all wiring in conduit conform to the requirements of the Authorities Having Jurisdiction ("AHJs").
- .2 Install conduit and conductors concealed in all finished areas, and concealed to the degree made possible by finishes in partially finished and unfinished areas. Conduit may be exposed in unfinished areas such as Electrical and Mechanical Rooms.
- .3 All wiring within mechanical and equipment rooms shall be contained in thin wall electric metallic tubing ("EMT") conduit. The wiring shall not change colour, gauge, type (Solid/Stranded), or contain splices within the conduit pipe. All splicing shall occur at proper junction boxes. Maintain 20% spare capacity within conduit pipes for future wire and install nylon pull strings, secured at both ends, in all conduit.
- .4 Where conduit and/or conductors are exposed, arrange same to avoid interference with other work and parallel to the building lines. Where horizontal conduits and/or conductors are exposed, install as high as possible. Do not install conduit and/or conductors within 150 mm of "hot" pipes or equipment unless the conduit and/or conductors are associated with the equipment.
- .5 Provide conduit for all conductors except armoured cable and copper sheathed mineral insulated conductors, and except where cable tray, duct or similar raceway materials are provided. Unless otherwise specified or required, conduit shall be as follows:
 - .1 for feeders exceeding 208V (except concrete encasement), main distribution wiring in electrical, mechanical or other service rooms and for concealed conduit in exterior walls – rigid galvanized steel;
 - .2 for exposed conduit outside the building to surface mounted "FS" boxes and for semi-exterior areas such as loading docks – rigid galvanized steel;
 - .3 for exposed conduit mounted at a height of less than 1200 mm in electrical, mechanical or other service areas – rigid galvanized steel;
 - .4 for short branch circuit connectors to motorized equipment (minimum length 450 mm, maximum length 600 mm with 180° loop); galvanized steel flexible liquid-tight conduit;
 - .5 at points, where conductors cross building expansion joints – galvanized steel flexible conduit;
 - .6 in climate controlled areas, for conduit larger than 50 mm diameter containing distribution conductors or communication system conductors (fire alarm, telephone, etc.) except as noted above – EMT with separate insulated ground conductor;
 - .7 for conduit embedded in concrete or for low voltage conductors run underground – rigid PVC;
 - .8 for conductors in climate controlled areas and unless otherwise specified above – EMT.
- .6 Minimum EMT conduit size is 20mm (3/4").
- .7 Install low voltage wiring (unless otherwise required by Authorities Having Jurisdiction) in EMT with steel couplings and connectors.
- .8 Use rain tight connectors for surface mounted conduits.
- .9 Armoured cable ("BX") may be used for final connections from junction boxes to:
 - .1 motorized terminal devices suspended above ceilings;
 - .2 to vibrating equipment, such as transformers and motors.

- .10 The maximum length of any individual piece of BX cable is 3.0 metres.
- .11 Minimum flexible conduit size is 21mm (3/4") and maximum length of any flexible conduit run is 3.0 metres.
- .12 Install approved fire stopping to maintain all fire separations and as required by the Authorities Having Jurisdiction.
- .13 Vertical conduits and other raceways shall be curbed to prevent the flow of water between floors and to prevent water flowing down the outside of the conduit and raceways.
- .14 Provide a separate ground conductor in all plastic conduit.

3.04 INSTALLATION OF PULLBOXES AND JUNCTION BOXES

- .1 Provide junction boxes wherever required. All pull boxes and junction boxes must be accessible after the work is completed.
- .2 Provide pullboxes in conduit systems wherever necessary to facilitate conductor installations. Generally, conduit runs exceeding 30 m in length, or with more than two (2) 90° bends shall be equipped with a pullbox installed at a convenient and suitable intermediate accessible location.
- .3 Accurately locate and identify all concealed pullboxes and junction boxes on "as-built" record drawings. Clearly identify main pull or junction boxes (excluding obvious outlet boxes) by spray painting the outside of the covers with colour coded identification. In addition to painting miscellaneous signal boxes, clearly identify the specific system in which the box is installed.
- .4 Cover boxes in fire walls with aluminium tape and seal with caulking.
- .5 Unless otherwise specified boxes shall be as follows:
 - .1 boxes in rigid conduit and EMT in climate controlled areas shall be stamped galvanized or prime coated steel;
 - .2 boxes in non-climate controlled areas connected to rigid conduit and boxes in perimeter walls where insulation and vapour barrier is present shall be "Condulet" cast gasketed boxes;
 - .3 boxes in plastic conduit shall be rigid PVC plastic boxes.
- .6 Colour-code all junction boxes using coloured duct tape on the cover. Neatly identify the relevant system and circuit ID using permanent marker pen. Identify parallel conduit runs at common locations.

3.05 DOCUMENTATION AND SYSTEMS ACCEPTANCE

- .1 Provide Operating and Maintenance (O&M) Manuals in accordance with Section 20 01 10, and the following:
 - .1 A set of as-built drawings including complete wiring and connections diagrams
 - .2 Letters of Owner's Instructions
 - .3 Final ESA Certificate
 - .4 Representative certificates for:
 - .1 Building Automation System (BAS)
 - .2 Fire Alarm System as integral part of Fire Protection System detection and control system
- .2 Ensure that O&M Manuals are specific and apply to the models and types of equipment provided.
- .3 Ensure the Work has met requirements outlined in the Article entitled 'Completion' found in Section 20 01 10.

END OF SECTION

CONTENTS

PART 1 - GENERAL

- 1.01 GENERAL REQUIREMENTS**
- 1.02 SCOPE OF WORK**
- 1.03 SUBMITTALS**

PART 2 - PRODUCTS

- 2.01 VARRIABLE FREQUENCY DRIVES**

PART 3 - EXECUTION

- 3.01 INSTALLATION OF VARRIABLE FREQUENCY DRIVES**

PART 1 - GENERAL

1.01 GENERAL REQUIREMENTS

- .1 Comply with requirements of the Owner's General Requirements and all documents referred to therein.
- .2 Comply with requirements of Section 20 01 10 Mechanical General Requirements and all Documents referenced therein.

1.02 SCOPE OF WORK

- .1 Provide all required Variable Frequency Drives ("VFDs") for motorized equipment requiring varying speed control as noted on the equipment schedules and/or on the control schematics.

1.03 SUBMITTALS

- .1 Submit shop drawings for all VFDs.

PART 2 - PRODUCTS

2.01 VARIABLE FREQUENCY DRIVES

- .1 VFDs to be rated to operate from 3 phase input voltage of 208 or 600 volts \pm 10%, as indicated in the Documents, and frequency range from 48 to 63 Hz. In addition, a tolerated voltage window to allow system to operate from a line of +30% to -35% nominal voltage. System to incorporate circuitry that allows drive or bypass contactor to remain "sealed in" over this voltage tolerance at a minimum.
- .2 VFDs to employ a full wave rectifier to prevent input line notching and operate at a minimum fundamental input power factor of 0.97 at all speeds and loads.
- .3 VFDs efficiency to be 97% or better at full speed and load.
- .4 Output voltage and current ratings to match adjustable frequency operating requirements of standard 3ph, 60Hz, NEMA design B inverter-duty motors in compliance with NEMA-MG1, Part 31 Standard. Overload current capacity for variable torque overload capacity to be 110% of rated current for 1 minute out of 10 minutes and 130% for 2 seconds. Output frequency to be adjustable between 0 and 500 Hz.
- .5 Open loop static speed regulation to be 0.1% to 0.3% (10% of motor slip). Dynamic speed accuracy to be 4%-sec. or better open loop.
- .6 When a suitable motor is used, drive provides breakaway torque equal to 200% of rated motor torque. Torque response time to be 5 ms or less.
- .7 Enclosures:
 - .1 in climate controlled areas – minimum NEMA 12;
 - .2 in non-climate controlled areas – minimum NEMA 3R.
 - .3 outdoor installations – minimum NEMA 4X
- .8 Harmonic Filters and Reactors:
 - .1 VFDs to include internal 5% impedance AC line reactor (or equivalent 5% impedance dual positive and negative DC bus reactors) provided as a standard to reduce input current harmonic content and provide isolation from power line transients and to reduce RFI emissions.
 - .2 VFDs serving motors sized 18 kw (25 HP) or more to be provided with harmonic filters to limit harmonics distortion produced by each drive to following maximum levels as measured on input side of drive:
 - .1 Total harmonic distortion (voltage) – 5%;
 - .2 Total harmonic distortion (current) – 10%.
 - .3 Harmonic filter shall have the following features:
 - .1 passive inductor/capacitor network;

- .2 all Harmonic filters be provided with a capacitor contactor that allows the capacitors to be removed from the circuit if the VFD is operating below 40% speed;
 - .3 full load efficiency of harmonic mitigation equipment / VFD combination to be greater than 96%;
 - .4 copper wiring;
 - .5 220°C system insulation class and temperature rise of 130°C;
 - .6 anti-vibration pads between reactor or transformer core and enclosure;
 - .7 ventilated, sprinkler proof NEMA-3R enclosure.
 - .8 where VDFs with bypass features are provided, harmonic filters shall be wired to be bypassed when the VFD is in the bypass mode.
 - .9 manufactured and tested in accordance with latest applicable standards of ULC, CSA and NEMA;
 - .10 treat characteristic low frequency harmonics generated by a 3-phase, diode bridge rectifier load (5th, 7th, 11th, 13th, etc.);
- .9 Controls And Adjustment Functions
- .1 Include for following:
 - .1 programmable critical frequency lockout ranges to prevent VFD from operating load continuously at an unstable speed;
 - .2 proportional integral derivative (PID) speed loop regulators with an auto tune function as well as manual adjustments; PID setpoint controllers to allow pressure or flow signals to be connected to VFD, using microprocessor in VFD for closed loop control; includes 250 ma of 24 VDC auxiliary power and capability of loop powering a transmitter supplied by others; two parameter sets for first PID that allow sets to be switched via a digital input, serial communications or from keypad for night setback, summer/winter setpoints, etc; independent, second PID loop that can utilize second analogue input and modulate analogue outputs to maintain setpoint of an independent process (ie. valves, dampers, etc.); setpoints, process variables, etc. to be accessible from serial communication network;
 - .3 programmable analogue inputs that accept current or voltage signals;
 - .4 programmable analogue outputs (0-20ma or 4-20 ma), that may be programmed to output proportional to Frequency, Motor Speed, Output Voltage, Output Current, Motor Torque, Motor Power (kW), DC Bus voltage, Active Reference, and other data;
 - .5 programmable digital inputs;
 - .6 programmable digital Form-C relay contact outputs for programmable on and off delay times and adjustable hysteresis; rated for maximum switching current 8 amps at 24 VDC and 0.4 A at 250 VAC; maximum voltage 300 VDC and 250 VAC; continuous current rating 2 amps RMS;
 - .7 run permissive circuit - for damper or valve control; dry contact closure that will signal damper to open (VFD motor does not operate); when damper is fully open, a normally open dry contact (end-switch) closes; closed end-switch is wired to a VFD digital input and allows motor operation; two separate safety interlock inputs, when either is opened, motor to coast to stop, and damper to close;
 - .8 two independently adjustable accel and decel ramps with 1 – 1800 seconds adjustable time ramps;
 - .9 firefighter's override input - upon receipt of a contact closure from fireman's control station, VFD operates in one of two modes: operate at a programmed predetermined fixed speed or operate in a specific firefighter's override PID algorithm that automatically adjusts motor speed based on override set point and

feedback; mode overrides all other inputs (analogue/digital, serial communication and keypad commands), except customer defined safety run interlock, and forces motor to run in one of the two modes; "Override Mode" to be displayed on control panel; upon removal of override signal, VFD resumes normal operation.

.10 Operator Control Panel

- .1 front mounted plug-in operator control panel consisting of keypad, multi-line backlit LCD display for programming and fault diagnostics;
- .2 keys (switches) for HAND, OFF, AUTO, and manual speed control INCREASE/DECREASE;
- .3 menu navigation and parameter selection keys for custom programming;
- .4 HELP key for assistance with programming and troubleshooting;
- .5 date and time clock - clock to have a battery backup with 10 years minimum life span; clock to be used to date and time stamp faults and record operating parameters at time of fault; if battery fails VFD I automatically reverts to hours of operation since initial power up; clock also to be programmable to control start/stop functions, constant speeds, PID parameter sets and output relays; VFD to have a digital input that allows an override to time clock (when in off mode) for a programmable time frame; four (4) separate, independent timer functions that have both weekday and weekend settings;
- .6 parameter names, fault messages, warnings and other information to be displayed in complete words or standard abbreviations to allow user to understand what is being displayed without use of a manual or cross reference table, as follows:
 - .1 "HAND" position to start drive and modify reference frequency by use of INCREASE/DECREASE keys;
 - .2 "OFF" position stops drive;
 - .3 "AUTO" position allows drive to be started or stopped using whichever remote start/stop command configured; drive speed controlled by external speed reference input or by PID controller.
 - .4 applicable operating values to be capable of being displayed in engineering (user) units; operating displayed include:
 - .1 Output Frequency;
 - .2 Motor Speed (RPM, %, or Engineering units);
 - .3 Motor Current;
 - .4 Drive Temperature;
 - .5 DC Bus Voltage;
 - .6 Output Voltage.

.11 Protective Functions:

- .1 For each programmed warning and fault protection function, keypad displays a message in complete words or standard abbreviations. Three most recent fault messages and times are stored in drive's fault history.
- .2 VFDs include metal oxide varistors (MOV's) for phase to phase and phase to ground line voltage transient protection.
- .3 Short circuit current rating of the entire VFD assembly (VFD and bypass, when provided), 100,000 amps to be provided per UL 508C without relying on line fuses.
- .4 Ground fault protection, motor phase loss protection and phase unbalance protection to be provided. Single phase protection to be provided on input and output.
- .5 VFDs to provide electronic motor overload protection qualified per UL 508C.

- .6 Protection to be provided for AC line or DC bus overvoltage at 130% of maximum rated or under-voltage at 65% of minimum rated.
- .7 Stall protection to be programmable to provide a warning or stop VFD after motor has operated above a programmable torque level for a programmed time limit.
- .8 Underload protection to be programmable to provide a warning or stop VFD after motor has operated below a selected underload curve for a programmed time limit.
- .9 Over-temperature protection to provide a warning if power module temperature is less than 5C below over-temperature trip level.
- .10 Input terminal to be provided for connecting a motor thermister (PTC type) to drive's protective monitoring circuitry. An input to also be programmable to monitor an external relay or switch contact.
- .11 VFDs through 56 kW (75HP) to be protected from damage from input and output power miss-wiring. VFD to sense this condition and display an alarm on control panel.
- .12 EMI / RFI filters to be provided as per standard EN 61800-3.
- .13 Automatic reset feature to automatically reset selected faults and attempt to restart drive based on control parameters such as adjustable time delays, number of restart attempts and duration of restart attempts. Faults include following:
 - .1 Overcurrent;
 - .2 Overvoltage;
 - .3 Under-voltage;
 - .4 Analogue input signal reference loss;
 - .5 External fault.
- .14 Additional built-in protection circuits include:
 - .1 Overcurrent trip limit;
 - .2 Under-voltage trip limit;
 - .3 Microprocessor fault;
 - .4 Keypad control panel loss;
 - .5 Serial communication loss;
 - .6 External fault interlock inputs;
 - .7 Adjustable output frequency and motor speed limits;
 - .8 Pass code parameter change protection;
 - .9 Keypad operator control lockout.
- .12 VFD Bypass
 - .1 Provide a complete factory wired and tested bypass system consisting of an output contactor and bypass contactor, service (isolation) switch and VFD input fuses are required. Bypass designs, which have no VFD only fuses, or that incorporate fuses common to both the VFD and the bypass will not be accepted.
 - .2 The bypass enclosure door and VFD enclosure must be interlocked such that input power is turned off before either enclosure can be opened. The VFD and Bypass as a package shall have a cUL listed short circuit rating of 100,000 amps and shall be indicated on the data label.
 - .3 Door interlocked padlockable disconnect switch that will disconnect all input power from the drive and all internally mounted options.

- .4 Bypasses shall be either electromechanical or electronic; electromechanical bypass shall utilize three (3) contactor bypass circuits (relays and contactors) to switch and to identify status; electronic bypasses shall meet the requirements of the following paragraphs:
- .5 The following operators shall be provided:
 - .1 Bypass Hand-Off-Auto (H-O-A);
 - .2 Drive mode selector and light;
 - .3 Bypass mode selector and light;
 - .4 Bypass fault reset
 - .5 Bypass LDC display, 2 lines, for programming and status / fault / warning indications
- .6 Motor protection from single phase power conditions - The Bypass system must be able to detect a single phase input power condition while running in bypass, disengage the motor in a controlled fashion, and give a single phase input power indication. Bypass systems not incorporating single phase protection in Bypass mode are not acceptable.
- .7 The system (VFD and Bypass) tolerated voltage window shall allow the system to operate from a line of +30%, -35% nominal voltage as a minimum. The system shall incorporate circuitry that will allow the drive or bypass contactor to remain "sealed in" over this voltage tolerance at a minimum.
- .8 The Bypass system shall NOT depend on the VFD for bypass operation. The bypass shall be completely functional in both Hand and Automatic modes even if the VFD has been removed from the enclosure for repair / replacement.
- .9 Serial communications – the bypass and VFD shall be capable of being monitored and or controlled via serial communications. Provide communications protocols as required to communicate with selected Building Automation System in the bypass controller.
- .10 BACnet Serial communication bypass capabilities shall include, but not be limited to; bypass run-stop control; the ability to force the unit to bypass; and the ability to lock and unlock the keypad. The bypass shall have the capability of allowing the DDC to monitor feedback such as, bypass current (in amps), bypass kilowatt hours (resettable), bypass operating hours (resettable), and bypass logic board temperature. The DDC shall also be capable of monitoring the bypass relays output status, and all digital input status. All bypass diagnostic warning and fault information shall be transmitted over the serial communications bus. Remote bypass fault reset shall be possible. The following additional bypass status indications and settings shall be transmitted over the serial communications bus – keypad "Hand" or "Auto" selected, and bypass selected. The DDC system shall also be able to monitor if the motor is running under load in both VFD and bypass (proof of flow) in the VFD mode over serial communications or Form-C relay output. A minimum of 40 field parameters shall be capable of being monitored in the bypass mode.
- .11 Run permissive circuit - there shall be a run permissive circuit for damper or valve control. Regardless of the source of a run command (keypad, time-clock control, or serial communications) the VFD and bypass shall provide a dry contact closure that will signal the damper to open (VFD motor does not operate). When the damper is fully open, a normally open dry contact (end-switch) shall close. The closed end-switch is wired to a VFD system input and allows motor operation. Two separate safety interlock inputs shall be provided. When either safety is opened, the motor shall be commanded to coast to stop, and the damper shall be commanded to close.
- .12 The bypass control shall monitor the status of the VFD and bypass contactors and indicate when there is a welded contactor contact or open contactor coil. This failed contactor operation shall be indicated on the Bypass LCD display as well as over the serial communications protocol.
- .13 The bypass control shall include a programmable time delay for bypass start and keypad indication that this time delay is in process. This will allow VAV boxes to be driven open

- before the motor operates at full speed in the bypass mode. The time delay shall be field programmable from 0 – 120 seconds.
- .14 The bypass control shall be programmable for manual or automatic transfer to bypass. The user shall be able to select via keypad programming which drive faults will generate an automatic transfer to bypass and which faults require a manual transfer to bypass.
- .15 There shall be an adjustable motor current sensing circuit for the bypass and VFD mode to provide proof of flow indication. The condition shall be indicated on the keypad display, transmitted over the building automation protocol and on a relay output contact closure.
- .16 The bypass controller shall have six programmable digital inputs, and five programmable Form-C relay outputs.
- .17 The relay outputs from the bypass shall be programmable for any of the following indications:
- .1 System started;
 - .2 System running;
 - .3 Bypass override enabled;
 - .4 Drive fault;
 - .5 Bypass fault;
 - .6 Bypass hand-Off-Auto (H-O-A) position;
 - .7 Motor proof of flow (broken belt);
 - .8 Overload;
 - .9 Bypass selected;
 - .10 Bypass run;
 - .11 System started (damper opening);
 - .12 Bypass alarm;
 - .13 Over temperature
- .18 The digital inputs for the system shall accept 24VAC or 24VDC. The bypass shall incorporate internally sourced power supply and not require an external control power source. The bypass power board shall supply 250 ma of 24 VDC for use by others to power external devices.
- .19 Customer Interlock Terminal Strip – provide a separate terminal strip for connection of freeze, fire, smoke contacts, and external start command. All external safety interlocks shall remain fully functional whether the system is in VFD or Bypass mode. The remote start/stop contact shall operate in VFD and bypass modes. The terminal strip shall allow for independent connection of up to four (4) unique safety inputs.
- .20 The user shall be able to select the text to be displayed on the keypad when the safety opens.
- .13 Acceptable Manufacturers:
- .1 Danfoss
 - .2 ABB
 - .3 Eaton/ Cutler-Hammer
 - .4 Rockwell Automation/ Allen-Bradley
 - .5 Johnson Controls
 - .6 Siemens
 - .7 Toshiba
 - .8 Hitachi

PART 3 - EXECUTION

3.01 INSTALLATION OF VARIABLE FREQUENCY DRIVES

- .1 VFD installation shall conform to all governing Codes and Standards and shall be inspected, as required, by the Authorities Having Jurisdiction ("AHJ's). Make any corrections to the Work to comply with the requirements of the AHJ's in order to obtain approval for the Work.
- .2 Meet Manufacturer's installation instructions.
- .3 Arrange for the manufacturers technical representative to inspect the installation of each drive and to commission operation with start-up and testing procedures. Provide coordination of control sequences for start-up and testing.
- .4 Properly ground the electrical system as per manufacturer's instructions.
- .5 Provide a separate steel conduit/shielded wiring for all supply, line load and control wiring.
- .6 Install the drive not more than 10m (30ft.) from the motor. The length of wiring connection shall not exceed 10m (30ft.). Provide support for the variable frequency drive in the vicinity of the motor as required.
- .7 Start-up Service:
 - .1 The manufacturer shall provide start-up commissioning of the variable frequency drive and its optional circuits by a factory trained certified technician. The commissioning personnel shall be the same personnel that will provide service and warranty repairs at the customer's site.
 - .2 The manufacturer shall provide four hours of customer operator training on operation and service diagnostics at the time of equipment commissioning.
 - .3 Drive manufacturer shall provide as much assistance is required to the air balance contractor to set the drives to provide the specified air flow.

PART 1 - GENERAL

1.01 GENERAL REQUIREMENTS

- .1 Comply with requirements of the Owner's General Requirements and all documents referred to therein.
- .2 Comply with requirements of Section 20 01 10 Mechanical General Requirements and all Documents referenced therein.

1.02 GENERAL INSTRUCTIONS

- .1 Testing Adjusting and Balancing ("TAB"): means to test, adjust and balance all systems, including equipment, to perform in accordance with Contract Documents.
- .2 Follow start-up procedures as recommended by Manufacturer.
- .3 Special start-up procedures may be specified elsewhere.

1.03 SITE INSPECTIONS AND SUBSEQUENT MEETINGS

- .1 Schedule once a month, site visits to correspond with the weekly site meeting.
- .2 After each site visit submit a written report to the Construction Manager and Mechanical Consultant.
- .3 Site visits shall commence at the start of the air distribution work and be spread over the construction period up to the start of the balance of the work.
- .4 If work requiring correction is discovered during an inspection, be sure that the required correction work is clearly indicated in the report.
- .5 In addition to site meetings and inspections specified above, attend, when requested by the Consultant, at the TAB Contractor's expense any other meetings where the TAB Contractor's presence is required.

1.04 ASSISTANCE FROM MECHANICAL TRADE CONTRACTOR

- .1 The Mechanical Trades, and their Sub-trades, shall provide the TAB Trades all of the assistance required to complete the TAB Trade's scope of Work. This shall include but not be limited to:
 - .1 Provision of all required shop drawings and fan and pump curves.
 - .2 Provision of all required test ports.
 - .3 Provision of all required specialty Trades (Sheet Metal Trades, Plumbing Trades, Building Automation (BAS) Trades, and similar) as may be necessary to complete TAB Work.
 - .4 All assistance required to balance variable speed systems in accordance with the design.

1.05 QUALIFICATIONS

- .1 The TAB agency shall be a current member in good standing with either the Associated Air Balance Council (AABC) or National Environmental Balancing Bureau (NEBB) or National Building Comfort Testing Association (NBCTA).

1.06 REFERENCE STANDARDS

- .1 Perform TAB Work for complete mechanical systems over entire operating range in accordance with most stringent conditions of selected standard:
 - .1 AABC (Associated Air Balance Council).
 - .2 ASHRAE (American Society of Heating Refrigerating & Air Conditioning Engineers).
 - .3 NABC (National Air Balance Council).
 - .4 SMACNA (Sheet Metal & Air Conditioning Contractors National Association).
 - .5 Specifications herein or elsewhere in the Contract Documents.
- .2 If these Contract Documents set forth more stringent requirements than the Reference Standards, these Contract Documents shall prevail.

1.07 SCOPE OF WORK

- .1 Provide all labour, materials, products, equipment and services to test, adjust and balance all air and hydronic systems to verify conformance to specified quantities and to the design intent of the mechanical system.
- .2 The following systems and or equipment are included in the Scope of Work:
 - .1 Air Systems:
 - .1 Air Handling Units
 - .2 Return Fans
 - .3 Exhaust Fans
 - .4 Supply Fans
 - .5 Transfer Air Fans
 - .6 Zone Branch and Main Ducts
 - .7 Diffusers, Registers and Grilles
 - .8 Coils (Air Temperatures and Flow)
 - .2 Hydronic Systems:
 - .1 Heat Pumps
 - .2 Chillers
 - .3 Cooling Towers
 - .4 Pumps
 - .5 System Mains and Branches
 - .6 Heat Exchangers
 - .7 Chilled Water and Heating Coils (Water Temperature and Flow)
 - .8 Reheat Coils in Terminal Units
 - .3 Potable Water Systems:
 - .1 Domestic Booster Pumps
 - .2 Domestic Hot Water Recirculation
 - .3 Domestic Hot Water Heaters
 - .4 Pressure Reducing Stations

1.08 FINAL BALANCING

- .1 Start final TAB Work only when:
 - .1 building exterior envelope is complete and closed in;
 - .2 rooms requiring a relative differential relative pressure performance have doors, windows, and finishes complete, and sealing and caulking of any room envelope penetrations is complete;
 - .3 permanent power is available;
 - .4 construction of mechanical systems is essentially completed.

1.09 RELATIVE DIFFERENTIAL PRESSURE BALANCING

- .1 The TAB contractor shall ensure that each room (noted with relative pressure required) shall have the noted pressures. The final balanced condition of each area, zone and room as shown and indicated in the project drawings shall include testing and adjusting of pressure conditions and dynamic balancing of air flow to achieve the specified and indicated values.
- .2 TAB contractor shall adjust the system(s) as required to maintain room pressurization. The TAB contractor shall install, where required, new sheaves and belts to facilitate these adjustments to place the operating position of the fan in an efficient operating position.

- .3 TAB Contractor shall adjust the outside air, return air and exhaust air dampers to provide the correct amount of outside air to maintain system pressurization.

1.10 ACCURACY

- .1 The accuracy of measurements shall be in accordance with AABC or NEBB Standards or +5%, whichever is more stringent.
- .2 Instrument calibration shall be in accordance with referenced standards and shall have been completed within three (3) months of commencement of TAB Work.

1.11 SUBMITTALS

- .1 Submit shop Testing Adjusting and Balancing ("TAB") Reports to the Consultant for review.
- .2 All reports shall include instrument calibration certificates, a report summary and remarks section explaining the rationale for how the system was configured for testing, and a listing of any deficiencies.
- .3 Format to be in accordance with referenced standard listed above, but using design drawing units.
- .4 Reports shall be indexed as follows:
 - .1 Air Systems:
 - .1 Summary
 - .2 Procedure
 - .3 Instrumentation
 - .4 Drawings
 - .5 Equipment/Component Summary
 - .6 Fan data sheets
 - .7 Fan curves
 - .8 Air handling unit profile data
 - .9 Traverse data and schedule
 - .10 Outlets data summary and schematic (per system)
 - .11 Relative Space Pressurization
 - .12 Fume hood
 - .2 Hydronic Systems:
 - .1 Summary
 - .2 Procedure
 - .3 Instrumentation
 - .4 Drawings
 - .5 Equipment/Component Summary
 - .6 Pump data sheets
 - .7 Pump curves
 - .8 Pump profile data
 - .9 Balancing valve summary and schematic (per system)
 - .10 Coils (heating and cooling) per system.
- .5 Produce "as-constructed" full system schematics and floor plans identifying the location where all measurements were taken and the resulting flows that were obtained. Use as-built drawings for reference.

- .6 Submit two (2) copies of preliminary TAB reports, each in "D" ring binders, complete with index tabs for verification and approval of Consultant.
- .7 Submit two (2) hard copies of final TAB reports each in "D" ring binders, and one (1) copy of final TAB report on a USB memory stick after approval by the Consultant.
- .8 Obtain the shop drawing for each fan system. Mark the actual operating point on the fan curve for each fan. Include the fan curves for each fan in the balancing report.
- .9 Obtain the shop drawing for each pump system. On the pump curve for each pump mark the actual operating point on the curve. Include the pump curves with superimposed power draw, rpm and impeller size.

1.12 VERIFICATION

- .1 Reported measurements shall be subject to verification by Consultant. Provide instrumentation and manpower to verify results of up to 30% of all reported measurements. Number and location of verified measurements to be at discretion of the Consultant.
- .2 A measured flow deviation of more than 10% between the verification reading and the reported data shall be considered a failure of the verification procedure.
- .3 A failure of more than 10% of the selected verification readings shall result in the rejection of the report as unacceptable.
- .4 Should the report be rejected, the TAB Trades shall rebalance all systems, submit new certified reports and make a re-inspection at no additional cost to the Owner.
- .5 Bear costs to repeat TAB Work, as required, to the satisfaction of the Consultant.

1.13 SETTINGS

- .1 Lock and permanently mark settings as required by reference Standards.

1.14 TAB COMPLETION

- .1 TAB to be considered complete only when final reports have 'Reviewed' status from Consultant.
- .2 Confirm that all flow stations are providing accurate measurements as described in the Design Documents.

1.15 AIR MOVING

- .1 General:
 - .1 Measurements as required by Systems referenced standards.
 - .2 Due to the extent of the hard ceilings some areas will be required to be pre-balanced prior to the installation of the drywall ceilings.
 - .3 Provide face velocity test and smoke test for fume hoods according to ASHRAE 110.
 - .4 Mechanical Contractor to provide all required parts, belts and adjustments for all systems as deemed necessary to complete the required balancing.
- .2 Measurements:
 - .1 Air velocity.
 - .2 Static pressure.
 - .3 Velocity pressure.
 - .4 Temperature:
 - .1 Dry bulb;
 - .2 Wet bulb;
 - .3 Dew Point (where relevant to control sequences).
 - .5 Cross sectional area.
 - .6 RPM.

- .3 Electrical power:
 - .1 Voltage
 - .2 Current draw.
- .4 Location of Equipment Measurements:
 - .1 Inlet and outlet of each:
 - .1 Fan
 - .2 Coil
 - .3 Filter
 - .4 Damper
 - .5 Flow Station
 - .6 Other auxiliary equipment
- .5 Location of System Measurements:
 - .1 Main ducts.
 - .2 Main branch ducts.
 - .3 Sub-branch ducts.
 - .4 Each supply, exhaust and return air inlet and discharge.
 - .5 Other auxiliary equipment.
 - .6 All areas served by system.
 - .7 Before and after the silencers.

1.16 HYDRONIC SYSTEMS

- .1 Provide Hydronic Systems TAB measurements as required by referenced standards, including, but not limited to, the following requirements:
- .2 Measurements:
 - .1 Flow
 - .2 Pressure
 - .3 Temperature
 - .4 Specific gravity
 - .5 RPM
 - .6 Electrical power:
 - .1 Voltage.
 - .2 Current draw.
- .3 Location of equipment measurements:
 - .1 Inlet and outlet of each:
 - .1 Coil
 - .2 Chiller
 - .3 Heat Pump
 - .4 Pump
 - .5 Heat Exchanger
- .4 Heating and Cooling System:
 - .1 Flow and set point at each circuit balancing valve.

- .2 Pump
- .3 Balancing valves.
- .4 Control valves.
- .5 Balancing Pumps:
 - .1 For constant volume systems the TAB Trades shall open the main balancing valves in the system and measure the flow for each pump system with the system running at its maximum capacity.
 - .2 The TAB Trades shall submit a preliminary report indicating the operating point for each pump.
 - .3 For variable volume systems the TAB Trades shall adjust the variable frequency drive to provide the correct flow to the system. The TAB Contractor shall identify the speed that the variable frequency drive is set at to achieve this flow rate on the balancing report.

PART 2 - PRODUCTS

2.01 NIL

PART 3 - EXECUTION

3.01 GENERAL REQUIREMENTS

- .1 Costs to perform Testing, Adjusting and Balancing (TAB) work for air and hydronic systems to be included in the Tender for the Mechanical Work.
- .2 TAB Work shall be carried out by an independent balancing firm specializing in air and water balancing, acceptable to the Consultant, to undertake this work as follows:
 - .1 Provide personnel to review working drawings, make site visits, prepare reports and take responsibility for measuring and adjusting all air supply, exhaust, return and transfer systems and water and other fluid pumping systems operate in accordance with specified requirements with tolerance of +/- 5%
 - .2 Review and check working drawings to ensure that modifications, if required, are implemented prior to execution of work.
 - .3 Provide inspections during the course of construction and issue reports making whatever recommendations are necessary in the interests of achieving specified pumping, heat transfer and air balance.
 - .4 When the work is sufficiently completed, inspect, check and test all pump and fan systems. Also cooperate with the BAS Subcontractor to achieve required air quantities where devices such as modulating dampers and hydronic valves are installed.
 - .5 Provide assistance to the Consultant for on-site spot verification of air and water balance report.
- .3 TAB shall be conducted in the presence of the Commissioning Authority and/or the Owner's Project Manager, or designated representative.
- .4 The TAB Trades shall confirm that the flow stations provided in the supply, return and exhaust air ductwork are measuring accurate readings. The variable speed drive shall be adjusted to allow for measurements at 50%, 75% and 100% flow. The flow displayed by the flow stations shall be confirmed to be accurate. Provide in the balancing report the results of the three point calibration.
- .5 Equipment settings, including manual damper quadrant positions, manual valve indicators, fan speed control levers, and similar controls and devices shall be physically marked to show final settings.

3.02 PREBALANCING

- .1 The TAB Trades shall preset the balancing dampers prior to the installation of the drywall ceilings by either running the air handling unit at 100 % outside air (if unit is available) or providing a portable fan to provide supply air at the required static pressure.

- .2 Once the system has been prebalanced the balancing dampers that will be located above the drywall ceilings shall be securely locked in place.
- .3 System air flows shall be confirmed once the space has been completed.

3.03 AIR BALANCING

- .1 Perform air balancing in accordance with current NBCTA, NEBB or AACB procedural standards by adjusting fan speed. Use damper throttling only in systems where fan motor is less than 1 HP or where throttling results in no greater than one (1) additional fan HP over a reduced RPM condition.
- .2 Where ductwork is subject to static pressure in excess of 75mm.wg (3 in.wg), leak test 25% minimum of total installed duct area of all representative sections of the total system. All testing to conform to requirements of HVAC Duct Leakage Test Manual, 1985, Sections 5 and 6 and tested duct leakage class at a test pressure equal to the design duct pressure class rating to be equal to or less than leakage Class 6 as defined in 4.1 of Ref. 35.
- .3 Provide Dial 1000 or Dial 2000 or acceptable alternative, duct pilot tube test opening enclosures for installation by the Sheet Metal Trades. Provide all required test opening locations and installation instructions to the Sheet Metal Trades.
- .4 The TAB Contractor shall confirm that the flow stations provided in the supply, return and exhaust air ductwork are measuring accurate readings. The variable speed drive shall be adjusted to allow for measurements at 50%, 75% and 100% flow. The flow displayed by the flow stations shall be confirmed to be accurate. Provide in the balancing report the results of the three point calibration.
- .5 After inspection and tests, report all required replacement of sheaves and belts and all required adjustments and ductwork modifications to achieve system performance as specified.
- .6 Fans and Air Handling Systems
 - .1 Verify that all ductwork, dampers, grilles, registers and diffusers have been installed per design.
 - .2 Balance air handling systems at minimum outdoor air quantities. On completion of TAB procedures, retest at maximum outdoor air quantities.
 - .3 Test and adjust fan RPM to achieve design flow.
 - .4 Test and record motor voltage and amperage. Compare data with nameplate limits.
 - .5 Perform pitot tube traverse at all main and branch ducts. Compare traverse total with measured outlet total to determine actual duct leakage.
 - .6 Test and adjust minimum outdoor and relief air volumes.
 - .7 Test and record system static pressure profile of each air handling system at minimum outdoor air volume. Note coil (i.e. wet or dry) and filter condition of time of testing.
 - .8 Test and record entering and leaving air conditions for each heat transfer coil and device. Simulate conditions to achieve winter or summer design parameters.
 - .9 Test and record settings of motor thermal overload devices. Adjust settings where required.
- .7 Air Distribution and Terminals
 - .1 Adjust duct distribution to obtain specified air quantities. At least one zone balancing damper shall be completely open. Multi diffuser or grille branch ducts shall have at least one volume damper completely open.
 - .2 Test and adjust each air terminal to obtain specified flow. Adjust deflectors and pattern controllers to eliminate drafts.

3.04 HYDRONIC SYSTEM BALANCING

- .1 Perform hydronic system balancing by minor throttling for pumps that are less than 7.45 kW (10 HP) provided this results in a power draw of no greater than 10% of that required if the impeller were trimmed. For pumps greater than 7.45 kW (10 HP), the same limit applies but in no case is it to exceed 2.23 kW (3 HP). In either case where these limits are exceeded by throttling, the impeller is to be trimmed or replaced.

- .2 Make adjustments to achieve specified flows through heat exchangers, cooling towers, chillers and coils. Also report all pump data such as suction, and discharge pressure, current draw at tested voltage and starter OL heater sizes and pump motor nameplate ratings.
- .3 Provide pump curves indicating the operating point with superimposed power draw, RPM, impeller size, etc.
- .4 Instruct piping system installers on proper locations of flow measurement ports.
- .5 Report any required pump impeller adjustments to achieve specified performance.
- .6 Hydronic Pumps
 - .1 Test and adjust pumps to achieve design flows. Pumps shall be free of cavitation and vibration.
 - .2 Confirm individual pump impeller size by dead head testing.
 - .3 Plot, on the manufacturer's performance curve, the final operating point. Where pump balancing valves are used to obtain specified water flow, indicate balancing valve final position and recommend impeller size change where applicable.
 - .4 Test and record motor voltage and amperage. Compare data with nameplate limits.
 - .5 Test and record system operating pressure at strainer inlet, pump inlet and pump discharge.
 - .6 Test and record settings of motor thermal overload devices. Adjust settings where required.
- .7 Hydronic Equipment
 - .1 Test and adjust water flow to devices such as coils, and heat exchangers to obtain the specified flow. Compare actual equipment water side pressure drops with manufacturer's published data.
 - .2 Where equipment is used in heat transfer (i.e. Air and Water Coils), measure entering and leaving liquid and gas conditions and compare to manufacturer's published data.
 - .3 Where possible, simulate design conditions for testing. If simulation is not practical, perform seasonal testing when design conditions can be achieved.
- .8 Hydronic Piping and Distribution
 - .1 Adjust water flow in distribution system to obtain specified flows.
 - .2 Test and record flow and differential pressure systems to establish references for satisfactory operation.
 - .3 Test and adjust system feeders to ensure adequate system static pressure is available under all operating conditions.
 - .4 Test and adjust hydronic terminals to obtain specified flow.

3.05 DOMESTIC WATER SYSTEMS

- .1 Domestic Water Booster System
 - .1 Confirm individual domestic water booster pump impeller size by dead head testing.
 - .2 Test motor voltage and amperage and compare readings against nameplate limits.
 - .3 In multiple pump sets, confirm each individual pump is equally loaded under various pump on and off configurations.
 - .4 Confirm settings of each pressure regulating valve assembly.
 - .5 Confirm design supply water pressure is achieved at all potable water supply branches.
- .2 Domestic Hot Water Recirculation
 - .1 Test and adjust domestic hot water circulation pump to obtain specified capacity.
 - .2 Confirm individual pump impeller size by dead head testing.
 - .3 Test motor voltage and amperage and compare readings against nameplate limits.

- .4 Test and adjust distribution to obtain specified flow through each domestic hot water recirculation branch.

3.06 REPORTS

- .1 General
 - .1 Summarize all testing into logical sections, tabulated and summarized.
 - .2 Identify system terminals and distribution on legible plan or schematic drawings depicting actual system arrangement. Label pitot tube traverse locations, terminal identification and equipment identification in a manner consistent with the contract documents.
- .2 After deficient air distribution system items have been rectified, retest and issue a final report and certificate covering the following:
 - .1 Specified and achieved total air quantities per system supported by curves for all fans over 150 l/s (300 cfm) capacity.
 - .2 Specified and achieved individual air quantities per outlet with supporting schematic diagrams showing test points. On variable air volume distribution systems adjust each VAV terminal for specified minimum and maximum flows. Balancing downstream from the VAV terminals is also required as part of the Work.
 - .3 Nameplate and actual motor loading in amperes at actual voltage and installed overload heater size and manufacturer.
 - .4 Specified and actual fan total static pressures with breakdown showing inlet and discharge pressures with data shown on fan curves.
 - .5 Shelve and belt sizes and quantities per unit.
- .3 After hydronic system adjustments, retest systems and issue final report confirming systems are operating in compliance with design.
- .4 Report Verification
 - .1 Cooperate with the Commissioning Agent in field verification of the final reported valves.
 - .2 Specific and random verifications will be performed using the same procedures used in preparation of the reports.
 - .3 Sufficient verifications will be performed to satisfy the Commissioning Agent that the reports accurately represent the actual system conditions.

PART 1 - GENERAL

1.01 GENERAL REQUIREMENTS

- .1 Comply with requirements of the Owner's General Requirements and all documents referred to therein.
- .2 Comply with requirements of Section 20 01 10 Mechanical General Requirements.
- .3 Comply with requirements of Section 20 01 50 Basic Materials and Methods.
- .4 Comply with the requirements of Section 20 05 05 Mechanical Demolition

1.02 SCOPE OF WORK

- .1 Demolition and removal of existing duct, pipe and equipment insulation.
- .2 Generally ductwork, casings and plenums to be insulated shall include, but not limited to, the following:
 - .1 all fresh air intake ductwork, casings and plenums from fresh air intakes to and including mixing plenums or sections, or, if mixing plenums or sections are not provided, to the first heating coil, or if both mixing plenums or sections and heating coil sections are not provided, and the fresh air is not tempered, then the fresh air ductwork system complete;
 - .2 mixed supply air or preheated supply air casings, plenums and sections to and including the fan section where not factory insulated;
 - .3 supply air ductwork outward from fans, except for supply ductwork exposed in the area it serves;
 - .4 exhaust discharge ductwork for a distance of 10 ft. (3m) downstream (back) from exhaust openings to atmosphere, including any exhaust plenums within the 10 ft. (3m) distance;
 - .5 ductwork outside building, and any other ductwork, casings, plenums or sections required to be insulated;
 - .6 Refer to Ductwork Thickness Tables herein and Part 3 of these Specifications for additional requirements.
- .3 Finishes for Ductwork Insulation shall include, but not limited to, the following:
 - .1 PVC: Unless otherwise specified or required, jacket all exposed duct insulation other than calcium silicate, exposed mineral fibre duct, plenum and casing insulation, and mineral fibre equipment insulation and flexible elastomeric where inside the building with white sheet PVC and PVC fitting covers;
 - .2 Canvas: Unless otherwise specified or required, jacket all exposed calcium silicate insulation, exposed mineral fibre duct, plenum and casing insulation, and mineral fibre equipment insulation with canvas;
 - .3 Metal: Unless otherwise specified or required, jacket all pipe insulation outside the building with metal;
 - .4 Protective Coatings: Unless otherwise specified or required, apply a protective coating to all flexible elastomeric insulation. Apply one (1) coat where inside the building and two (2) coats where outside the building.

1.03 REFERENCES

- .1 Material and method of application to comply with or be tested in accordance with following Standards:
 - .1 Thermal Insulation Association of Canada (TIAC) National Insulation Standard, excluding section 12

1.04 DEFINITIONS

- .1 In this Section;
 - .1 "Ambient": as applied to temperatures means outdoor design temperature.
 - .2 "Concealed": as applied to mechanical services and equipment located in space above opaque suspended ceilings, and within trenches not in boiler rooms, pipe and/or duct shafts, and non-accessible chases and furred spaces.
 - .3 "Ductwork": as applied to this section includes ducts, fans, supply unit casings, and plenums.
 - .4 "Exposed": as applied to remainder of mechanical services and equipment which are not "concealed" as defined above. For greater certainty, the following locations are Exposed:
 - .5 Services in tunnels,
 - .6 Services in space beneath raised floors,
 - .7 Trenches located in boiler rooms,
 - .8 Outdoors.
 - .9 "Conditioned air": air supplied from air handling units which heats, cools, dehumidifies, or humidifies the air.
 - .10 "Unconditioned space": rooms or spaces that are not supplied with conditioned air, including ceiling spaces which are not part of a ceiling return plenum system
 - .11 "Outdoor": mechanical services and equipment located outside of the building envelope including services located beneath overhangs and soffits, and exposed to any outdoor condition including temperature, sun exposure, or precipitation.
 - .12 "Mastic": heavy-consistency waterproof compound for outdoor applications used in conjunction with reinforcing fabric that remains adhesive and generally pliable with age, to provide either a breathable or vapour barrier finish to insulation.

- .13 "Coating": light-consistency compound for indoor applications used in conjunction with reinforcing fabric, to provide either a breathable or vapour barrier finish to insulation.
- .14 "Finish Jacket": final finish protective layer for insulation, including lagging fabric, PVC, metal, and adhesive films; that provides weather-protective finish depending on application.
- .15 "Service temperature": for purpose of ductwork temperature, is equal to the design operating temperature.

1.05 QUALITY ASSURANCE

- .1 Qualifications: Execute work of this section only by skilled tradesmen regularly employed in the application of insulation to piping, ductwork, and equipment for building fire protection, plumbing and drainage, heating, cooling, and ventilating systems.
- .2 Insulation, self-adhesive tape, adhesives and any insulation finishes to be ULC labelled and listed for flame spread rating of less than 25 and smoke development classification of less than 50.
- .3 Acceptable Manufacturers:
 - .1 Insulation: Fiberglas Canada Inc., Knauf Fiber Glass, Manson, Roxul.
 - .2 Tape: Avery Dennison, Mactac, Tuck, Compac.
 - .3 Canvas: Fattal Thermocanvas, Alpa-Maritex 3451-RW, Clairmont Diplag 60.
 - .4 Lagging adhesive: Childers CP.50A-HV2, Fosters 30-36 asbestos free.

1.06 SITE VISIT

- .1 Visit the site prior to tender and verify all conditions. Prior to submitting price, the Mechanical Division Contractor is to review all discrepancies and verify the locations of all existing services that are being extended and the routing of new services. Also report all ambiguities, discrepancies, departures from building by-laws and/or from good practice. Failure to do so will result in all additional costs being the responsibility of the Mechanical Division Contractor. Include for any alternate routing of new or rerouting of existing services to accommodate all site conditions in the tender price.

1.07 VOC REQUIREMENTS

- .1 All adhesives, sealants, paints and coatings used on or inside of building weatherproofing layer shall have a VOC content that is less than the content limits defined in LEED Product Requirements.

PART 2 - PRODUCTS

2.01 DUCTWORK INSULATION SELECTION

- .1 Insulate Hot Ductwork where surface temperature of equipment in normal service is greater than 122°F (50°C) in accordance with this Section.
- .2 Insulate Cold and Dual Temperature Ductwork where surface temperature in normal service is less than 60°F (14°C) in accordance with this Section complete with a vapour barrier jacket.
- .3 Insulation shall be provided to ensure maximum duct surface temperature does not exceed 110°F (44°C). Where ASTM C1055 "Standard Guide for Heated System Surface Conditions that Produce Contact Burn Injuries" allows for surface temperatures to be exceeded, submit for Consultant review the Insulation Trades Value Engineering proposal to reduce the extent of insulation, including a corresponding savings to the Owner. Under no circumstances shall surface temperature on the outside of insulation exceed 150°F (66°C) when piping system is operating under design service conditions.
- .4 Insulation, self-adhesive tape, adhesives and any insulation finishes to be ULC labelled and listed for flame spread rating of less than 25 and smoke development classification of less than 50.

2.02 D1 - GLASS FIBRE BLANKET WITH VAPOUR BARRIER

- .1 Application:
 - .1 flexible blanket,

- .2 service temperature: up to **250°F (121°C)**
- .2 Material:
 - .1 to ASTM C1290 "Standard Specification for Flexible Fibrous Glass Blanket Insulation Used to Externally Insulate HVAC Ducts"
 - .2 FSK jacket of kraft bonded to aluminum foil reinforced with glass fibre yarn
 - .3 thermal performance: R = 4.2 sq.ft*°F*hr/BTU @ 75°F (0.74 sq.m*°C/W @ 24°C)
 - .4 density: 0.75 lb/cu.ft (12 kg/cu.m)
 - .5 Rated 25/50 per ASTM E84, UL 723 and NFPA 255
 - .6 vapor transmission : maximum 0.02 perms
- .3 Acceptable Manufacturers:
 - .1 John Manville Microlite XG Duct Wrap
 - .2 Owens Corning SOFTR Duct Wrap
 - .3 Knauf Fibreglass Friendly Feel Duct Wrap
- .4 Glass Fibre Blanket with Vapour Barrier Thickness Table:

D1 - Glass Fibre Blanket with Vapour Barrier Thickness Table				
Nominal Surface Temperature Range	Application	Insulation Type	Insulation Thickness	Description
40°F to 150°F (5°C to 65°C)	Rectangular supply – indoors - concealed	D1	1½" (38mm)	Do not insulate terminal supply air ductwork that is exposed in the room that it serves. Where supply air ducts continue to another space, maintain ductwork insulation This includes all supply air ductwork from outside air plenums to air handling units.
40°F to 150°F (5°C to 65°C)	Round and Oval supply – indoors - concealed	D1	1½" (38mm)	Do not insulate terminal supply air ductwork that is exposed in the room that it serves. Where supply air ducts continue to another space, maintain ductwork insulation This includes all supply air ductwork from outside air plenums to air handling units.
40°F to 150°F (5°C to 65°C)	Round and Rectangular return – indoors - concealed	D1	1½" (38mm)	Applies to return air ductwork located above the ceiling and below the building roof.
Notes: (1) Insulation thickness indicated is "out of box" prior to installation. (2) Where insulation is installed on ductwork having flanged connections, increase duct insulation as required to provide a 1/2" (12 mm) cover on flanges and duct angles. (3) For duct sizes 20" (500 mm) to 34" (850 mm) utilize either 1-1/2" (40 mm) flexible wrap or 1" (25 mm) rigid board insulation where 1" (25 mm) insulation is called for. For thicknesses greater than 1" utilize rigid board insulation. (4) For ductwork exposed to the outdoors the top section of the insulation shall be sloped to ensure positive drainage (5) Pre-insulated flexible ductwork need not have additional insulation provided.				

2.03 D2 – MINERAL FIBER RIGID BOARD WITH VAPOUR BARRIER

- .1 Application:

- .1 Insulation System D2 **for ducting temperature up to 450°F (232°C)** on exposed cold or dual temperature rectangular and curved surfaces 10" (250mm) dia and over;
- .2 Material(s):
 - .1 rigid board insulation shall comply with ASTM C 612 "Standard Specification for Mineral Fiber Block and Board Thermal Insulation", Type 1;
 - .2 thermal performance: 0.23 btu/hr/in/sq.ft/°F @ 75°F (0.033 W/m/°C @ 24°C)
 - .3 vapor transmission: maximum 0.02 perms
 - .4 density: 3.0 lb/cu.ft (48 kg/cu.m)
 - .5 service temperature: up to jacket surface temperature (air contact) up to 66°C (150°F) and un-jacketed surface temperature (equipment contact) up to **232°C (450°F)**.
 - .6 rated at 25/50 per ASTM E84, UL 723 and NFPA 255;
 - .7 product must comply with the requirements of ASTM C 795 when being used over stainless steel,
- .3 Vapour Retardant Jacketing:
 - .1 vapour retardant jacketing shall be bleached "KRAFT" paper reinforced with a glass fibre yarn and bonded to an aluminum foil or aluminum foil reinforced with a glass fibre yarn and laminated to fire resistant kraft, secured with ULC or cUL listed pressure sensitive tape and/or outward clinched expanded staples and vapour barrier mastic as required;
 - .2 Fibreglass Reinforced Foil and Fire Retardant "KRAFT" Facing.
- .4 Acceptable Manufacturers:
 - .1 Johns Manville - Manville 814 Spin-Glas
 - .2 Owens Corning - 703 Board
 - .3 Knauf Fiberglass - Insulating Board
 - .4 Manson
 - .5 Or equivalent
- .5 Mineral Fiber Rigid Board with Vapour Barrier Thickness Table:

D2 - Mineral Fiber Rigid Board with Vapour Barrier Thickness Table				
Nominal Surface Temperature Range	Application	Insulation Type	Insulation Thickness	Description
-40 to 150°F (-40 to 65 C)	Outside Air Intake:	D2	Two layers each 2" (50mm)	Outside air plenum and all ductwork up to mixing box or heating coil where air temperature will be heated above ambient air dew point. This includes all outside air ductwork from the point that it enters the building to the air handling unit or supply air fan.
-40 to 150°F (-40 to 65 C)	Exhaust Air Discharge	D2	2" (50 mm)	From wall/roof penetration to 20 feet (6m) from exterior. Terminate at fan if fan closer than 20 feet (6m). Include the exhaust air plenum.
-40 to 150°F (-40 to 65 C)	Smoke control pressurization ductwork	D2	1½" (38mm)	Entire length

D2 - Mineral Fiber Rigid Board with Vapour Barrier Thickness Table				
Nominal Surface Temperature Range	Application	Insulation Type	Insulation Thickness	Description
-40 to 150°F (-40 to 65 C)	Rectangular - Outdoor - Supply	D2	2" (50 mm)	Entire length
-40 to 150°F (-40 to 65 C)	Rectangular - Outdoor - Return	D2	1½" (38mm)	Required for return air ductwork exterior to the building. Insulate entire exposed length of ductwork including ductwork up and downstream of heat recovery devices (ERV, enthalpy wheel) and silencers.
-40 to 150°F (-40 to 65 C)	Rectangular - Outdoor - Exhaust	D2	1½" (38mm)	Insulate entire exposed length of ductwork exterior to the building up and downstream of heat recovery devices (ERV, enthalpy wheel) and silencers. All other exhaust air ductwork does not require insulation.
40°F to 150°F (5°C to 65°C)	Supply unit casings and plenums - indoors	D2	1" (25mm)	Entire length
40°F to 150°F (5°C to 65°C)	Rectangular supply – indoors - exposed	D2	1" (25mm)	Do not insulate terminal supply air ductwork that is exposed in the room that it serves. Where supply air ducts continue to another space, maintain ductwork insulation This includes all supply air ductwork from outside air plenums to air handling units.
40°F to 150°F (5°C to 65°C)	Rectangular supply – indoors - concealed	D2	1" (25mm)	Do not insulate terminal supply air ductwork that is exposed in the room that it serves. Where supply air ducts continue to another space, maintain ductwork insulation This includes all supply air ductwork from outside air plenums to air handling units.
65°F to 90°F (18°C to 32°C)	Return air – indoor - unheated spaces	D2	2" (50 mm)	Ductwork passing through unheated spaces where the temperature will be below 50°F (10°C). Insulate entire exposed length of ductwork including silencers.
70°F to 200°F (20°C to 93°C)	Exhaust Systems for Dishwasher Exhaust - indoors	D2	1" (25mm)	Entire length

D2 - Mineral Fiber Rigid Board with Vapour Barrier Thickness Table				
Nominal Surface Temperature Range	Application	Insulation Type	Insulation Thickness	Description
<p>Notes:</p> <p>(1) Insulation thickness indicated is "out of box" prior to installation.</p> <p>(2) Where insulation is installed on ductwork having flanged connections, increase duct insulation as required to provide a 1/2" (12 mm) cover on flanges and duct angles.</p> <p>(3) For duct sizes 20" (500 mm) to 34" (850 mm) utilize either 1-1/2" (40 mm) flexible wrap or 1" (25 mm) rigid board insulation where 1" (25 mm) insulation is called for. 2.04 D3 - FLEXIBLE ELASTOMERIC CLOSED CELL FOAM

- .1 Application:
 - .1 service temperature: up to **180°F (82°C)**;
 - .2 sheet self-adhering, roll type;
- .2 Material(s):
 - .1 to ASTM C534,
 - .2 thermal performance: 0.28 btu/hr/in/sq.ft/°F @ 75°F (0.04 W/m/°C @ 24°C)
 - .3 manufacturer specific sealer/adhesive.
- .3 Acceptable manufacturers:
 - .1 Armstrong - AP Armaflex Self-Adhering Sheet Insulation
 - .2 Rubatex
- .4 Flexible Elastomeric Closed Cell Foam Insulation Thickness Table:

D3 - Flexible Elastomeric Closed Cell Foam Insulation Thickness Table				
Nominal Surface Temperature Range	Application	Insulation Type	Insulation Thickness	Description
-40 to 150°F (-40 to 65 C)	Round – Outdoor – Supply, Return, Exhaust	D3	Two layers each 1" (25mm)	Required for ductwork exterior to the building. Insulate entire exposed length of ductwork including ductwork up and downstream of heat recovery devices (ERV, enthalpy wheel) and silencers. All other exhaust air ductwork does not require insulation.
-40 to 150°F (-40 to 65 C)	Drain pans	D3	3/4" (20mm)

2.05 D4 - LOW TEMPERATURE PHENOLIC BOARD

- .1 Application:
 - .1 **High humidity environments**
 - .2 rigid for flat surfaces,
 - .3 service temperature: -100°F to 250°F (-73°C to +121°C)
- .2 Material(s):
 - .1 to ASTM C1126 (Gr.1),
 - .2 meeting 25/50 flame spread/smoke development when tested to ASTM E84,
 - .3 thermal performance: 0.145 btu/hr/in/sq ft/°F @ 50°F (0.021 W/m/°C @ 10°C)
 - .4 density: 2.3 lb/cu.ft (37 kg/cu.m)
- .3 Acceptable manufacturers:
 - .1 Kingspan - Koolphen K
 - .2 Or equivalent
- .4 Low Temperature Phenolic Board Insulation Thickness Table:

D4 - Low Temperature Phenolic Board Insulation Thickness Table				
Nominal Surface Temperature Range	Application	Insulation Type	Insulation Thickness	Description
-40 to 150°F (-40 to 65 C)	Outside Air Intake:	D4	3" (75mm)	Outside air plenum and all ductwork up to mixing box or heating coil where air temperature will be heated above ambient air dew point. This includes all outside air ductwork from the point that it enters the building to the air handling unit or supply air fan.
-40 to 150°F (-40 to 65 C)	Exhaust Air Discharge	D4	1½" (38mm)	From wall/roof penetration to 20 feet (6m) from exterior. Terminate at fan if fan closer than 20 feet (6m). Include the exhaust air plenum.
-40 to 150°F (-40 to 65 C)	Blanked Off Louvres	D4	3" (75mm)

Nominal Surface Temperature Range	Application	Insulation Type	Insulation Thickness	Description
<p>Notes:</p> <p>(1) Insulation thickness indicated is "out of box" prior to installation.</p> <p>(2) Where insulation is installed on ductwork having flanged connections, increase duct insulation as required to provide a 1/2" (12 mm) cover on flanges and duct angles.</p> <p>(3) For duct sizes 20" (500 mm) to 34" (850 mm) utilize either 1-1/2" (40 mm) flexible wrap or 1" (25 mm) rigid board insulation where 1" (25 mm) insulation is called for. For thicknesses greater than 1" utilize rigid board insulation.</p> <p>(4) For ductwork exposed to the outdoors the top section of the insulation shall be sloped to ensure positive drainage</p> <p>(5) Pre-insulated flexible ductwork need not have additional insulation provided.</p>				

2.06 FASTENINGS:

- .1 Contact bond cement:
 - .1 quick hydraulic-setting finishing type for metal surfaces.
 - .2 Volatile Organic Content: maximum 80 g/L.
 - .3 Acceptable manufacturers:
 - .1 Bakor - No. 220-05
 - .2 Foster – Drion 85-75
 - .3 Or equivalent
- .2 Adhesive for flexible closed cell foam insulation:
 - .1 Volatile Organic Content: maximum 80 g/L.
 - .2 Acceptable manufacturers:
 - .1 Armaflex 520BLV
 - .2 Armaflex Low VOC Spray Contact Adhesive
 - .3 Rubatex R-373
 - .4 Or equivalent
- .3 Vapour barrier tape:
 - .1 Self –adhesive;
 - .2 colour matched and foil faced;
 - .3 UL 181A listed;
 - .4 4" (100 mm) wide;
 - .5 under 25 Flame Spread and under 50 Smoke Developed rating.
 - .6 Acceptable manufacturers:
 - .1 Johns Manville - Zeston Z-Tape
 - .2 MacTac Canada Limited - Vinyl Scrim or Foil Scrim Kraft
 - .3 Compac Corp.
 - .4 Fattal Canvas Inc. – Insultape
 - .5 Or equivalent
- .4 Fibrous insulation adhesive:
 - .1 Volatile Organic Content: maximum 250 g/L.

- .2 15 Flame Spread and 0 Smoke Developed ratings.
- .3 Acceptable manufacturers:
 - .1 Childers CHIL-STIX FRN CP-82
 - .2 Foster No. 85-70
 - .3 Or equivalent
- .5 Lap Seal Adhesive:
 - .1 Quick-setting adhesive for joints and lap sealing of vapour barriers.
 - .2 10 Flame Spread and 0 Smoke Developed ratings.
 - .3 Volatile Organic Content: maximum 250 g/L.
 - .4 Acceptable manufacturers:
 - .1 Bakor 220-05
 - .2 Childers CHIL-STIX FRN CP-82
 - .3 Foster: 85-75, Asbestos Free, Drion.
 - .4 Or equivalent
- .6 Canvas adhesive:
 - .1 Washable adhesive for cementing canvas lagging cloth to duct insulation.
 - .2 Acceptable manufacturers:
 - .1 Foster: 30-36 Asbestos Free.
- .7 Weld Pins, Studs and Clips:
 - .1 Acceptable manufacturers:
 - .1 Midwest Fasteners
 - .2 Continental Studwelding
 - .3 Or equivalent
- .8 Staples:
 - .1 Monel, flare type, minimum size ½" (12mm)
- .9 Tie Wire:
 - .1 16 ga. (1.6mm) stainless steel with twisted ends.
- .10 Caulking for sheetmetal jackets (outdoor use only):
 - .1 flexible butyl elastomer based vapour barrier sealant;
 - .2 fast-drying, aluminum colour finish;
 - .3 Acceptable manufacturers:
 - .1 Foster 95-44
 - .2 Or equivalent

2.07 COATINGS AND MEMBRANES

- .1 Reinforcing Membrane:
 - .1 synthetic fibre:
 - .1 Leno weave,
 - .2 indoor and outdoor use.
 - .3 Acceptable manufacturers:
 - .1 Foster Mast-A-Fab

- .2 Or equivalent
 - .2 glass-fibre fabric:
 - .1 indoor use.
 - .2 Acceptable manufacturers:
 - .1 Childers Chil-Glas #5/#10
 - .2 Or equivalent
 - .3 glass-fibre fabric for use with elastomeric closed cell foam:
 - .1 indoor use.
 - .2 Acceptable manufacturers:
 - .1 Childers Chil-Glass #10
 - .2 Or equivalent
- .2 Breather Coating - Indoors:
 - .1 for breather coatings and lagging adhesive,
 - .2 Volatile Organic Content: maximum 50 g/L.
 - .3 white in colour,
 - .4 Acceptable manufacturers:
 - .1 Childers CP-50A HV2
 - .2 Foster 30-36
 - .3 Or equivalent
- .3 Breather Mastic - Outdoors:
 - .1 for breather coatings and lagging adhesive,
 - .2 abrasion resistive, flexible,
 - .3 UV stabile,
 - .4 grey in colour.
 - .5 Acceptable manufacturers:
 - .1 Childers Vi-Cryl CP-10/11
 - .2 Foster 35-00 / 45-00
 - .3 Bakor 120-10
 - .4 Or equivalent
- .4 Vapour Barrier Coatings - Indoors:
 - .1 Volatile Organic Content: maximum 50 g/L.
 - .2 for vapour barrier coatings and lagging adhesive except for elastomeric closed cell foam,
 - .3 permeance rating 0.02 perms maximum,
 - .4 white in colour
 - .5 Acceptable manufacturers:
 - .1 Childers Chil Perm CP-34/35
 - .2 Foster 30-80, 30-90
 - .3 Or equivalent
- .5 Vapour Barrier Coatings for use with elastomeric closed cell foam- Indoors
 - .1 Acceptable manufacturers:

- .1 Childers CHIL-SPRAY WB CP-56 Adhesive
- .2 Or equivalent
- .6 Vapour Barrier Mastic - Outdoors:
 - .1 Outdoor vapour barrier mastic complete with reinforcing glass fabric for vapor barrier coatings and lagging adhesive,
 - .2 asphalt cutback,
 - .3 permeance rating 0.02 perms maximum,
 - .4 grey in colour.
 - .5 for outdoor use only; not rated to meet fire/smoke rating of 25/50.
 - .6 Acceptable manufacturers:
 - .1 Childers Chil-Pruf CP-22
 - .2 Foster 60-25/60-26
 - .3 Or equivalent

2.08 FIELD APPLIED FINISHES

- .1 PVC (Polyvinyl Chloride) finish jacket:
 - .1 minimum 20 mil thickness with permeability not more than 0.09 perms,
 - .2 flexible flat-sheet;
 - .3 Acceptable manufacturers:
 - .1 Johns Manville - Manville Zeston 2000
 - .2 ACWIL Insulations
 - .3 Sure Fit Systems
 - .4 Proto PVC – LoSMOKE
 - .5 Or equivalent
 - .4 pressure sensitive, colour matching vinyl tape.
 - .5 3M Venture Clad model 1579CW-WME, or equivalent, is acceptable for use in lieu of PVC finish jacket.
- .2 Canvas finish jacket:
 - .1 Apply in exposed areas, compacted firm, ULC listed, heavy plain weave cotton fabric at 6 oz./sq. yd. (220 g/m2) treated with diluted fire retardant lagging adhesive; and two applications of white fire resistant coatings.
 - .2 re-wettable fiberglass lagging fabric with water activated self-adhesive.
 - .3 suitable for field painting.
 - .4 Acceptable manufacturers:
 - .1 Fattal's Thermocanvas
 - .2 Alpha-Maritex 3451-RW
 - .3 Clairmont Diplag 60
 - .4 Glass-Cell FR
 - .5 Newtex - Zetex Rewettable
 - .6 Johns Manville
 - .7 Or equivalent

- .5 3M Venture Clad model 1579CW-WME, or equivalent, is acceptable for use in lieu of canvas finish jacket.
- .3 Metal finish jacket:
 - .1 Recover insulation and insulation finishes outside building or exposed to the weather with metallic jacket with metallic fittings.
 - .2 Band all transverse seams with waterproof mastic tape and caulk all longitudinal seams with silicone caulking.
 - .3 Seal the entire covering to achieve a watertight assembly.
 - .4 Equipment:
 - .1 stucco embossed aluminum not less than 0.016" (0.45mm) thick sheet or,
 - .2 corrugated stainless steel not less than 0.010" (0.25mm) thick sheet.
 - .5 Fittings:
 - .1 Custom made swaged ring or lobster back covers on bends and die shaped fitting covers over fittings, flanges, and couplings.
 - .6 Bands:
 - .1 12 mm (½ in) wide stainless steel with mechanical fasteners.
 - .7 Acceptable manufacturers:
 - .1 Alcan Canada Products - Thermaclad Type 1
 - .2 Childers Products Inc. - Fab Straps
 - .3 Or equivalent
- .4 Self-adhesive weather barrier membrane (SAWB):
 - .1 self-adhering membrane of acrylic adhesive with siliconized release paper, not exceeding flame/smoke generation rating of 25/50, for indoor and outdoor use,
 - .2 self-adhering membrane of rubberized asphalt compound with siliconized release paper, for outdoor use only
 - .3 laminated to stucco-embossed aluminum foil,
 - .4 self-sealing with penetration of self-tapping screws.
 - .5 water vapour permeance 0.05 perms.
 - .6 Acceptable manufacturers:
 - .1 3M Venture Clad 1579CW - indoor and outdoor applications
 - .2 Bakor - Foilskin - outdoor applications
 - .3 Polyguard Products Alumaguard 60 - outdoor applications
 - .4 Or equivalent
- .5 Protective finish for elastomeric cellular foam insulation
 - .1 indoors and outdoors:
 - .1 Armaflex WB Finish
 - .2 Or equivalent

2.09 DUCT LINER

- .1 Due to the cleaning requirements for the ducting, no internal acoustical lining is allowed. Use appropriate noise silencers instead.
- .2 Internal acoustical insulation may be used for transfer ducting only.
- .3 Rigid Duct Liner (for transfer ducts only)

- .1 Yellow or naturally coloured internal rigid glass fibre acoustical insulation with black sealer coating on one face.
- .2 Minimum sound absorption (NRC) of 0.60 as tested per ASTM C423 using Type "A" mounting.
- .3 Thermal conductivity at 75°F - 0.020 BTU/hr/ft/°F (24°C - 0.035 W/m/°C).
- .4 Acceptable Manufacturers:
 - .1 Certaineed Toughgard 300#, Manson Akousti-Liner R, Knauf Rigid Plenum Liner with ECOSE technology, Johns-Manville Permacoat R300, Owens Corning Quiet-R Rigid Coated Duct Liner.
- .4 Flexible Duct Liner
 - .1 Yellow or naturally coloured internal flexible glass fibre acoustical insulation with one face faced with non-woven fibreglass mat.
 - .2 Minimum sound absorption (NRC) of 0.60 as tested per ASTM C423 using Type "A" mounting.
 - .3 Thermal conductivity at 75°F - 0.023 BTU/hr/ft/°F (24°C - 0.040 W/m/°C).
 - .4 Acceptable Manufacturers:
 - .1 Certaineed Toughgard Duct Liner 150# or Type 150,
 - .2 Manson Akousti-Liner,
 - .3 Knauf Duct Liner with ECOSE technology,
 - .4 Owens Corning Quiet-R Rotary Duct Liner,
 - .5 Or equivalent.

2.10 VINYL NOISE ATTENUATION WRAP

- .1 1.0 lb/sq.ft non-lead loaded non-reinforced vinyl barrier sheets faced with a fibrous glass "scrim" reinforced aluminium foil facing on one side.
- .2 Thickness: 0.09"
- .3 Flammability: Must pass UL94V and FMVSS 302. Meet Class A flammability rating per ASTM E-84.
- .4 All hangers, support rods, concrete anchors shall be in accordance with manufacturers' Instructions.
- .5 Sound transmission loss requirements based on ASTM E90-09 and ASTM E413-04:

Sound Transmission Loss (db per Centre Line Frequency)						
125 Hz	250 Hz	500 Hz	1000 Hz	2000 Hz	4000 Hz	STC
15	16	21	26	33	38	26

- .6 Acceptable manufacturers:
 - .1 EAR Specialty Composites Tufcote Noise Barrier Lag-10;
 - .2 Audioseal Sound Barrier AB10-Lag;
 - .3 Or equivalent.

2.11 FIRE WRAP FOR DUTWORK

- .1 Where ductwork is indicated on the drawings to be wrapped in an equivalent fire rated enclosure, ductwork shall be provided with a fire rated wrap consisting of 40 mm (1-1/2") thick, non-combustible, flexible fireproof blanket, supplied in roll form. Provide sufficient number of layers to ensure the wrap provides the required fire separation.

- .2 Apply wrap directly onto the ductwork in strict accordance with the manufacturers' recommendation and ULC listing, Design No. FRD-4 Guide No. 40 U21 "FIRE RESISTANT DUCTS" as tested to ISO Standard 6944 and ULC Guide No. 440E9 per 0 mm clearance to combustibles.
- .3 Provide an aluminum foil face to exposed surface.
- .4 All hangers, support rods, concrete anchors and firestopping of duct penetrations through fire separations shall be in accordance with ULC listing and manufacturers' instructions.
- .5 Obtain approval from authorities having jurisdiction prior to ordering.
- .6 Fire wrap manufacturer shall review installation of the wrap prior to concealment and provide written confirmation that the installation is complete to the required listing. All items identified as deficient shall be rectified.
- .7 Refer to drawings for duct systems requiring fire wrap.
- .8 Acceptable Manufacturers:
 - .1 Thermal Ceramics;
 - .2 Unifrax FyreWrap;
 - .3 Or equivalent.

PART 3 - EXECUTION

3.01 GENERAL DESIGN AND PERFORMANCE REQUIREMENTS

- .1 Performance Requirements:
 - .1 As a minimum, insulation application methods and standards shall be as per the NATIONAL INSULATION STANDARDS of the Thermal Insulation Association of Canada.
- .2 General Insulation Application Requirements:
 - .1 General requirements pertaining to the application of mechanical insulation are indicated in Table 1.
 - .2 Prior to finishing of insulation of hot and cold exposed rectangular ductwork, provide corner beads similar to Roll-on Type.
 - .3 Unless otherwise specified, do not insulate the following:
 - .1 factory insulated equipment /plenums/ panels and piping;
 - .2 heated liquid system pump casings, valves, strainers and similar accessories;
- .3 Quality Assurance:
 - .1 Mechanical insulation shall be applied by a licensed journeyman insulation mechanic, or by an apprentice under direct, daily, on-site supervision of a journeyman mechanic, and the company with the sub-contract for mechanical insulation work shall be a member in good standing of the Thermal Insulation Association of Canada.
 - .2 Store and use adhesives, mastics, and insulation cements at ambient temperatures and conditions recommended by product manufacturers.
 - .3 Surfaces to be clean and dry before application of insulation. Apply insulation after pressure and leakage testing is completed and accepted.
 - .4 Place insulation with joints staggered and tightly butted, with no visible gaps.
 - .5 Neatly finish insulation at supports, protrusions, and interruptions.
 - .6 Seal exposed insulation with reinforced vapor barrier or breather coating/mastic as shown.
 - .7 Ductwork shall be field installed with finished jacket specified.
- .4 Flanges and Mechanical Couplings:
 - .1 Terminate sectional insulation approximately 50 mm from the flange or coupling on each side of the flange or coupling. Cover the flange or coupling with a minimum 50 mm

thickness of blanket mineral fibre insulation wide enough to butt tightly to the ends of the adjacent sectional insulation. Secure the blanket insulation in place and cover with a PVC cover.

- .5 For cold surfaces with the possibility of condensation, install insulation directly over ducts and not over hangers and supports.
- .6 For warm surfaces, line size hangers shall be permitted and insulation shall cover the hanger to maintain the specified thickness in accordance with ASHRAE 90.1.

3.02 INSULATION LIMITS

- .1 Externally insulate air distribution system components:
 - .1 Air conditioned with cooling or both heating and cooling: supply unit casings and plenums, free standing supply fans for both recirculating and non-recirculating type systems, and supply air ducts and plenums including the space served,
 - .2 Air conditioned only with heating: supply unit casing and plenums, free-standing supply fans, and supply air ducts and plenums up to the space served but not in the space itself,
 - .3 Conditioned air supply ducts including downstream of reheat coils,
 - .4 Un-conditioned supply air ducts and plenums that pass through unheated rooms or spaces,
 - .5 The first 12" (300mm) length of acoustically lined ductwork,
 - .6 Return air ducts and plenums in unheated spaces,
 - .7 Exhaust air ducts and plenums in unheated spaces,
 - .8 Exhaust air ducts between exhaust air damper and point of discharge to outside of building,
 - .9 Outside air intake ducts and plenums;
 - .1 for non-recirculating type ventilation systems without cooling coils, terminate plenum or casing insulation 12" (300mm) downstream of final heating coil,
 - .10 Mixed air plenums and ducts;
 - .1 for recirculating type ventilation systems without cooling coils, terminate outside air intake insulation 12" (300mm) downstream of mixing plenum,
 - .11 sheet metal blank-off plates behind unused sections of air intake louvers.
- .2 Externally insulate ductwork located outdoors:
 - .1 supply ducts;
 - .2 conditioned supply ducts;
 - .3 return ducts;
 - .4 exhaust ducts, excluding fan discharge duct;
 - .5 kitchen exhaust ducts with more than 3 m (10 ft) length of duct on roof, excluding fan discharge duct.
- .3 External insulation is not required on:
 - .1 casings, ducts or plenums which have been lined with acoustic insulation, except as described above,
 - .2 portions of intake ducts or plenums, unit casings and conditioned air plenums which are of double wall insulated construction,
 - .3 pre-insulated flexible ducts.
 - .4 factory insulated air handling units.

3.03 DUCTWORK INSULATION APPLICATION

- .1 Secure insulation on exposed rectangular ductwork with welded impaling pins and speed washer type fasteners at 12" (300 mm) on centre. Provide a minimum of two (2) rows of fasteners on each side of the duct.
- .2 In addition to the mechanical fasteners, adhere insulation to the duct with fire resistive adhesive applied to the duct in 6" (150 mm) wide strips at 18" (450 mm) centres. Tightly butt all joints and breaks in the insulation and seal with fire resistive mastic and 3" (75 mm) wide scrim foil pressure sensitive tape. Cut off protruding ends of welded pins and cover speed washers with same tape to ensure a smooth application of exterior jacket.
- .3 Fasten insulation to rectangular ductwork less than 31" (787 mm) wide and round ductwork with adhesive applied in 6" (150 mm) wide strips at 18" (450 mm) centres. Tightly butt all joints and breaks in the insulation. Seal with fire resistive mastic and 3" (75 mm) wide scrim foil pressure sensitive tape. Use tying cord only to temporarily secure insulation until adhesive has set. Remove prior to application of exterior jacket.
- .4 Insulate access doors or removable panels in ductwork as separate units to permit opening or removal without damage to the adjoining insulation.
- .5 Rigid insulation - fans, ducts, and casing:
 - .1 overlap horizontal boards over vertical boards, and butt edges tightly together.
 - .2 impale insulation on weld pins, studs, and clips at 12" (300mm) centres in all directions, with not less than 2 rows per side and bottom.
 - .3 secure insulation laps with mechanical fasteners (staples).
- .6 Rigid insulation - outside air duct and plenums - glass fibre:
 - .1 as above for fans, ducts, and casings, and;
 - .1 apply first layer of insulation without integral vapour barrier,
 - .2 apply second layer of insulation with integral vapour barrier with staggered joints.
- .7 Rigid insulation - outside air duct and plenum - phenolic board:
 - .1 as above for fans, ducts, and casings, but with only one layer of insulation board.
- .8 Rigid insulation - exhaust air plenums:
 - .1 as above for fans, ducts, and casings.
- .9 Flexible insulation:
 - .1 overlap insulation 2" (50mm) on each lap joint, and butt end edges tightly together,
 - .2 on rectangular ducts 24" (600mm) and wider, and round ducts 18" (450mm) diameter and larger;
 - .1 secure insulation to the underside of duct with weld pins, studs, and clips at 12" (300mm) centres in all directions, with not less than 2 rows per side and bottom,
 - .2 secure insulation laps with mechanical fasteners (staples),
 - .3 for round ductwork, the underside of duct is measured as being half the circumference of the duct.
- .10 Flexible elastomeric:
 - .1 wrap tightly onto ductwork and drain pans, and secure with 100% adhesive coverage.
 - .2 on round ducts, overlap insulation 2" (50mm) on each lap joint, and butt end edges tightly together,
- .11 Cover angles or standing seams on the outside of plenums, casings and ducts which extend beyond face of applied rigid insulation;
 - .1 with same material and thickness as adjacent ductwork,

- .2 extend this insulation 3" (75mm) on each side of the angle and place tight around the projecting leg of the angle.
- .3 apply rigid insulation overlapping edge of flexible insulation on angle so that outstanding part of insulated angle projects through work.
- .12 Cut and mitre rigid insulation at elbows and fittings and attach to ductwork with 50% coverage of adhesive, and mechanical fasteners with weld pins, speed clips and washers.
- .13 Attach speed washers when insulation has been placed on metal pins and cut off excess pin length flush with speed washer. Cover washers with vapour barrier tape.
- .14 At junctions between external insulation and acoustic insulation, overlap external insulation 12" (300mm) over acoustic lining.

3.04 EXTERIOR DUCTWORK INSULATION APPLICATION

- .1 In addition to requirements above, the following shall apply to all duct insulation exposed to the outdoors.
 - .1 All joints and penetrations shall be covered with two 3mm wet coats of vapour mastic reinforced with glass fabric.
 - .2 When dry, cover entire surface with 3mm coat of vapour mastic and while this coat is still wet, embed a layer of glass fabric, with all joints overlapped a minimum of 3" (75mm) and cover entire surface with another coat of mastic.
 - .3 All penetrations of angle iron supports shall be completely sealed to weather.
 - .4 Built up centre to slope top surface of insulation to prevent ponding.
 - .5 Paint mastic assembly with white coloured weather resistant paint when it is dry.
 - .6 Recover insulation and insulation finishes outside building or exposed to the weather with aluminum jacket with aluminum fittings. Band all transverse seams with waterproof mastic tape and caulk all longitudinal seams with silicone caulking. Seal the entire covering to achieve a watertight assembly. Aluminum jacket shall be reinforced to prevent buckling on horizontal surfaces.
 - .7 For rectangular and flat-oval ductwork:
 - .1 build-up and slope insulation on top of ductwork to provide a 1:100 drainage slope,
 - .2 where width of ductwork exceeds 24" (600mm), slope insulation in both directions.

3.05 SEALING INSULATION

- .1 Hot ducts, casings, and plenums - Indoors:
 - .1 service temperature: 70°F to 150°F (20°C to 65°C)
 - .2 apply vapour barrier tape to butt joints, overlapping my minimum 50 mm (2 in) each side,
 - .3 do not tape lap joints.
- .2 Cold or dual temperature ducts, casings, and plenums - Indoors:
 - .1 service temperature: Ambient to 70°F (20°C)
 - .2 apply reinforced vapor barrier coating to all corners, lap edges and butt edges, overlapping joint by minimum 2" (50mm) each side,
 - .3 cover mechanical fastener (staple) penetrations with reinforced vapour barrier coating and/or vapor barrier tape,
 - .4 insulate flanges and standing seams with overlapping strips of flexible insulation, and cover with reinforced vapour barrier coating.
- .3 Ducts - Hot Temperature - Outdoors:
 - .1 service temperature: 70°F to 150°F (20°C to 65°C)

- .2 apply reinforced breather mastic to all corners, lap edges and butt edges, overlapping joint by minimum 2" (50mm) each side.
- .3 cover mechanical fastener (staple) penetrations with reinforced breather mastic,
- .4 insulate flanges and standing seams with overlapping strips of flexible insulation, and cover with reinforced breather mastic.
- .5 for greater clarity, do not use vapor barrier tape on outdoor applications.
- .4 Ducts - Cold or Dual Temperature - Outdoors:
 - .1 service temperature: Ambient to 70°F (20°C)
 - .2 apply reinforced vapor barrier mastic to all corners, lap edges and butt edges, overlapping joint by minimum 2" (50mm) each side,
 - .3 cover mechanical fastener (staple) penetrations with reinforced vapour barrier mastic,
 - .4 insulate flanges and standing seams with overlapping strips of flexible insulation, and cover with reinforced vapour barrier mastic,
 - .5 for greater clarity, do not use vapor barrier tape on outdoor applications.
- .5 Apply mastics and coatings when ambient temperature is above 40°F (4°C), unless manufacturer's instructions permit colder ambient installation conditions.

3.06 INSULATION FINISH

- .1 Install protective finish on insulation in accordance with Table 2, after breather and vapour barrier sealing is completed.
- .2 Install finish jacket materials used for covering to allow 2" to 4" (50mm to 100mm) overlap on longitudinal and circumferential edges.
- .3 Fabric:
 - .1 Cotton lagging:
 - .1 apply cotton lagging with minimum two coatings of breather or vapor barrier coating adhesive as applicable to the duct system, and finish to provide a smooth surface free of wrinkles and sags.
 - .2 where cotton lagging with appropriate coating is used this satisfies the requirements of a sealer coating for Hot or Cold/Dual temperature ducting systems.
 - .2 Fibreglass lagging:
 - .1 apply re-wettable fibreglass lagging in accordance with manufacturer instructions. Finish to provide a smooth surface free of wrinkles and sags.
 - .2 where re-wettable fiberglass lagging is used this satisfies the requirements of a breather sealer coating for Hot piping systems.
- .4 Metal:
 - .1 use lock-on systems or secure sheeting with bands 18" (450mm) apart.
 - .2 joint sealing, indoor:
 - .1 Hot ducts and plenums: do not seal joints.
 - .2 Cold or Dual Temperature ducts and plenums: seal joints with caulking.
 - .3 curved surfaces: custom made swaged ring or lobster back covers,
 - .4 on outdoor hot and cold/dual temperature ductwork, caulk overlapping metal joints to permit expansion of metal jacket.
- .5 Self-Adhesive Weather Barrier (SAWB):
 - .1 Apply SAWB in accordance with manufacturer's instructions.
- .6 Flexible elastomeric closed cell foam insulation:

- .1 Apply thin coat of lagging adhesive, and apply glass mesh,
- .2 When dry apply indoor or outdoor finish at 400 square feet per gallon,
- .3 Apply second coat of same material, at same rate of application, after four hours.

Ductwork Insulation Finishes				
Location	Weather Exposure	System/Space	Finish	Insulation Type
Concealed	Indoors	All	Fabric	D1, D2, D4
Exposed	Indoors	Service Rooms	Fabric or PVC	D1, D2, D4
	Indoors	Public Spaces	PVC	D1, D2, D4
	Outdoors	All	Metal	D1, D2, D4
	Outdoors	All	SAWB	D1, D2, D4

3.07 VINYL DUCT WRAP INSTALLATION

- .1 Vinyl wrap manufacturer shall review installation of the wrap prior to concealment. All items identified as deficient shall be rectified.
- .2 Install in accordance with manufacturers' recommendations.

3.08 PAINTED DUCTWORK

- .1 Not applicable.

3.09 INSULATION PROTECTION

- .1 For indoor installation, protect exposed insulated ductwork from floor level up to 1200 mm (4 ft) above floor with 1.2 mm (18 ga) stainless steel jacket, secured to floor slab.
- .2 Provide access opening in protective sheeting for access to fire separation closures (fire dampers, smoke dampers and combination fire smoke dampers). Do not overlap closure slip joint with protective sheeting.

3.10 FIRE WRAP FOR DUCTWORK INSTALLATION

- .1 Fire wrap ductwork in accordance with manufacturer's installation ULC or cUL listing requirements, and any additional requirements of the Authorities Having Jurisdiction ("AHJs")
- .2 Fire wrap ductwork to maintain the continuity of the fire rating of the fire compartment of the source and/ or destination of the ductwork passing through other fire compartments. Maintain the requisite fire rating of the complete assembly.
- .3 Fire wrap manufacturer shall review installation of the wrap prior to concealment and provide written confirmation that the installation is complete to the required listing. All items identified as deficient shall be rectified.

3.11 FIELD INSPECTION QUALITY CONTROL

- .1 The Consultant reserves the right to have protective finish coverings removed on up to 5% of all fittings and flanges and duct mounted accessories to review the sealing of the insulation.
- .2 Upon inspection, if insulation sealing is found to be incorrect at any one, the Consultant, in their sole discretion, may call for the removal of the protective finish on fittings and flanges and duct mounted accessories for further review.
- .3 Repair defective sealing and replace protective coverings at no additional cost to the Owner.

PART 1 - GENERAL

1.01 GENERAL REQUIREMENTS

- .1 Comply with requirements of the Owner's General Requirements and all documents referred to therein.
- .2 Comply with requirements of Section 20 01 10 Mechanical General Requirements.
- .3 Comply with requirements of Section 20 01 50 Basic Materials and Methods.
- .4 Comply with the requirements of Section 20 05 05 Mechanical Demolition

1.02 REFERENCES

- .1 Material and method of application to comply with or be tested in accordance with following Standards;
 - .1 Thermal Insulation Association of Canada (TIAC) National Insulation Standard, excluding section 12
 - .2 NFPA 90-A Installation of Air-Conditioning and Ventilating Systems
 - .3 ASHRAE/IES 90.1 Energy Standard for Buildings Except Low-Rise Residential Buildings

1.03 DEFINITIONS

- .1 In this Section;
 - .1 "Ambient": as applied to temperatures means outdoor design temperature.
 - .2 "Concealed": as applied to mechanical services and equipment located in space above opaque suspended ceilings, and within trenches not in boiler rooms, pipe and/or duct shafts, and non-accessible chases and furred spaces.
 - .3 "Exposed": as applied to remainder of mechanical services and equipment which are not "concealed" as defined above. For greater certainty, the following locations are Exposed:

- .4 Services in tunnels,
- .5 Services in space beneath raised floors.
- .6 Trenches located in boiler rooms.
- .7 "Conditioned air": air supplied from air handling units which heats, cools, dehumidifies, or humidifies the air.
- .8 "Unconditioned space": rooms or spaces that are not supplied with conditioned air, including ceiling spaces which are not part of a ceiling return plenum system
- .9 "Outdoor": mechanical services and equipment located outside of the building envelope including services located beneath overhangs and soffits, and exposed to any outdoor condition including temperature, sun exposure, or precipitation.
- .10 "Mastic": heavy-consistency waterproof compound for outdoor applications used in conjunction with reinforcing fabric, that remains adhesive and generally pliable with age, to provide either a breathable or vapour barrier finish to insulation.
- .11 "Coating": light-consistency compound for indoor applications used in conjunction with reinforcing fabric, to provide either a breathable or vapour barrier finish to insulation.
- .12 "Finish Jacket": final finish protective layer for insulation, including lagging fabric, PVC, metal, and adhesive films; that provides weather-protective finish depending on application.
- .13 "Service temperature": for purpose of equipment temperature, is equal to the maximum heating or maximum cooling gas or vapour design operating temperature or the liquid supply operating temperature associated with the equipment.

1.04 SCOPE OF WORK

- .1 Demolition and removal of existing equipment insulation.
- .2 Generally equipment to be insulated shall include, but shall not limited to, the following:
 - .1 chilled water and/or potable cold water pump casings;
 - .2 roof drain sumps where inside the building;
 - .3 water meter(s);
 - .4 heat exchangers;
 - .5 expansion tank(s);
 - .6 Refer to Equipment Insulation Tables herein and Part 3 of these Specifications for additional requirements.
- .3 Finishes for Insulation shall include, but not limited to, the following:
 - .1 Canvas: Unless otherwise specified or required, jacket all exposed calcium silicate insulation, exposed mineral fibre duct, plenum and casing insulation, and mineral fibre equipment insulation with canvas;
 - .2 PVC: Unless otherwise specified or required, jacket all exposed pipe insulation other than calcium silicate and flexible elastomeric where inside the building with white sheet PVC and PVC fitting covers;
 - .3 Aluminium: Unless otherwise specified or required, jacket all pipe insulation outside the building with aluminium;
 - .4 Protective Coatings: Unless otherwise specified or required, apply a protective coating to all flexible elastomeric insulation. Apply one (1) coat where inside the building and two (2) coats where outside the building.
 - .5 Refer to Equipment Insulation Protective Finishes Tables herein for additional requirements.

1.05 QUALITY ASSURANCE

- .1 Qualifications: Execute work of this Section only by skilled tradesmen knowledgeable in the application of insulation to piping, ductwork, and equipment for building fire protection, plumbing and drainage, heating, cooling, and ventilating systems.
- .2 Quality Assurance: Execute work of this Section by a licensed journeyman insulation mechanic, or by an apprentice under direct, daily, on-site supervision of a journeyman mechanic. The company performing the mechanical insulation work shall be a member in good standing of the Thermal Insulation Association of Canada.

1.06 SITE VISIT

- .1 Visit the site prior to tender and verify all conditions. Prior to submitting price, the Mechanical Division Contractor is to review all discrepancies and verify the locations of all existing services that are being extended and the routing of new services. Also report all ambiguities, discrepancies, departures from building by-laws and/or from good practice. Failure to do so will result in all additional costs being the responsibility of the Mechanical Division Contractor. Include for any alternate routing of new or rerouting of existing services to accommodate all site conditions in the tender price.

1.07 VOC REQUIREMENTS

- .1 All adhesives, sealants, paints and coatings used on or inside of building weatherproofing layer shall have a VOC content that is less than the content limits defined in LEED Product Requirements.

PART 2 - PRODUCTS

2.01 EQUIPMENT INSULATION SELECTION

- .1 Insulate Hot Equipment where surface temperature of equipment in normal service is greater than 122°F (50°C) in accordance with this Section.
- .2 Insulate Cold and Dual Temperature Equipment where surface temperature of equipment in normal service is less than 60°F (14°C) in accordance with this Section complete with a vapour barrier jacket.
- .3 Insulation shall be provided to ensure maximum equipment surface temperature does not exceed 110°F (44°C). Where ASTM C1055 "Standard Guide for Heated System Surface Conditions that Produce Contact Burn Injuries" allows for surface temperatures to be exceeded, submit for Consultant review the Insulation Trades Value Engineering proposal to reduce the extent of insulation, including a corresponding savings to the Owner. Under no circumstances shall surface temperature on the outside of insulation exceed 140°F (60°C) when equipment is operating under design service conditions.
- .4 Insulation, self-adhesive tape, adhesives and any insulation finishes to be ULC labelled and listed for flame spread rating of less than 25 and smoke development classification of less than 50.

2.02 E1 – BLANKET MINERAL FIBERBOARD

- .1 Application:
 - .1 service temperature: up to jacket surface temperature (air contact) up to 150°F (66°C) and un-jacketed surface temperature (equipment contact) up to 450°F (232°C).
 - .2 rigid for flat surfaces or,
 - .3 scored board for curved surfaces 10 " (250mm) dia and over,
- .2 Materials(s):
 - .1 Rigid, non-combustible fibreglass board insulation complying with the requirements of ASTM C 612, Type II;
 - .2 jacket of kraft bonded to aluminum foil reinforced with glass fibre yarn;
 - .3 thermal performance: 0.23 btu/hr/in/sq ft/°F @ 75°F (0.033 W/m/°C @ 24°C)
 - .4 rated 25/50 per ASTM E 84, UL 723 and NFPA 255.
 - .5 vapor transmission: maximum 0.02 perms

- .6 density: 3.0 lb/cu.ft (48 kg/cu.m)
- .7 product must comply with the requirements of ASTM C 795 when being used over stainless steel,
- .3 Acceptable Manufacturers:
 - .1 Fiberglass,
 - .2 Knauf Fiberglass - Insulating Board
 - .3 Manson,
 - .4 Johns Manville - Manville 814 Spin-Glas
 - .5 Owens Corning - 703 Board
 - .6 Or equivalent.

- .4 Table E1: Blanket Mineral Fibreboard Thicknesses as follows:

TABLE E1: Blanket Mineral Fibreboard Thicknesses		
Service	Operating Temperature Range	Thickness
Hot Water Storage Tanks and Hydro-pneumatic Tanks	up to 200°F (80°C)	2" (50mm)
Hot Equipment plate-and-frame heat exchangers	60°F to 300°F (14°C to 150°C)	2" (50mm)
Cold and Dual Temperature plate-and-frame heat exchangers	Below 60°F (14°C)	2" (50mm)
Air Separators	up to 250°F (107°C)	2" (50mm)
Expansion Tanks	up to 250°F (107°C)	2" (50mm)
Pot feeders and filters.	up to 250°F (107°C)	2" (50mm)
Water softener	Below 60°F (14°C)	1" (25mm)
Any other Cold and Dual Temperature equipment	Below 60°F (14°C)	1" (25mm)

2.03 E2 – MINERAL GLASS SEMI-RIGID BOARD

- .1 Application:
 - .1 service temperature: up to jacket surface temperature (air contact) of 150°F (66°C) and un-jacketed surface temperature (equipment contact) up to 450°F (232°C)
- .2 Materials:
 - .1 to ASTM C795,
 - .2 semi-rigid or scored and folded board,
 - .3 FSK jacket of kraft bonded to aluminum foil reinforced with glass fibre yarn, maximum 0.02 perms to ASTM E96 Procedure A.
 - .4 noncombustible,
 - .5 thermal performance: 0.35 btu/hr/in/sq ft/°F @ 200°F (0.050 W/m/°C @ 93°C)
 - .6 vapor transmission : maximum 0.02 perms
 - .7 product must comply with the requirements of ASTM C 795 when being used over stainless steel,

- .3 Acceptable Manufacturers:
 - .1 John Manville Spin-Glas 813
 - .2 Owens Corning Pipe and Tank
 - .3 Knauf Fibreglass Pipe and Tank
 - .4 Or equivalent
- .4 Table E2: Mineral Glass Semi-rigid Board

TABLE E2: Mineral Glass Semi-rigid Board		
Service	Operating Temperature Range	Thickness
Hot Equipment shell-and-tube heat exchangers	up to 300°F (150°C)	2" (50mm)
Expansion tanks	up to 300°F (150°C)	2" (50mm)
Domestic hot water tank & heaters	up to 200°F (95°C)	1½" (40mm)
Radiant ceiling panels	up to 300°F (150°C)	2" (50mm)
Any other Hot Equipment	up to 300°F (150°C)	2" (50mm)
Cold or Dual Temperature shell-and-tube heat exchangers	Below 60°F (14°C)	2" (50mm)
Water dealkalizer	Below 60°F (14°C)	1" (25mm)
Any other Cold or Dual Temperature equipment	Below 60°F (14°C)	1" (25mm)

2.04 E3 – FLEXIBLE ELASTOMERIC SHEET

- .1 Application:
 - .1 Cold Curved Surfaces -40°F to 200°F (-40 to 95°C)
 - .2 service temperature: up to 82°C (180°F).
- .2 Materials:
 - .1 Flexible fire retardant elastomeric unicellular sheet covering to ASTM C534,
 - .2 sheet self-adhering, roll type,
 - .3 thermal performance: 0.28 btu/hr/in/sq ft/°F @ 75°F (0.04 W/m/°C @ 24°C)
 - .4 manufacturer specific sealer/adhesive.
- .3 Acceptable Manufacturers:
 - .1 Armstrong - AP Armaflex Self-Adhering Sheet Insulation
 - .2 Johns Manville;
 - .3 Nomaco;
 - .4 Therma-Cel
 - .5 Rubatex
 - .6 Or equivalent
- .4 Table E3: Flexible Elastomeric Sheet Thickness

TABLE E3: Flexible Elastomeric Sheet Thickness		
Service	Operating Temperature Range	Thickness
Water meters;	Below 60°F (14°C)	1" (25mm)
Chilled water and glycol cooling system expansion tanks;	Below 60°F (14°C)	1" (25mm)
Chilled water and glycol cooling system storage tanks	Below 60°F (14°C)	1½" (40mm) applied in two (2) staggered ¾" (20mm) layers
Chilled water and glycol cooling system air separators;	Below 60°F (14°C)	1" (25mm)
Chiller evaporator shells;	Below 60°F (14°C)	2" (50mm) applied in two (2) staggered 1" (25mm) layers
Chiller evaporator heads;	Below 60°F (14°C)	1½" (40mm) applied in two (2) ¾" (20mm) layers with removable box
Chiller components as follows: <ul style="list-style-type: none"> • evaporator unit including nozzles; • intercooler including drop leg and heads; • suction connection between compressor and evaporator; • inter-stage gas connection; • liquid connection between intercooler drop leg and evaporator unit; 	Below 60°F (14°C)	1½" (40mm) applied in two (2) staggered ¾" (20mm) layers
Chilled water and glycol cooling system pot feeders and filters;	Below 60°F (14°C)	¾" (20mm) applied in two (2) 3/8" (10mm) layers
Chilled water and glycol cooling system pumps;	Below 60°F (14°C)	1" (25mm) with removable box
Chilled water and glycol cooling pump suction and discharge guides;	Below 60°F (14°C)	1" (25mm) with removable box
Condenser water pump suction and discharge guides used in free cooling applications;		1" (25mm) with removable box
Cold water booster pumps		1" (25mm) with removable box
Cold water booster pumps suction and discharge guides;		1" (25mm) with removable box
Softener tanks;		¾" (20mm)
Pot feeders and filters;		¾" (20mm)

TABLE E3: Flexible Elastomeric Sheet Thickness		
Service	Operating Temperature Range	Thickness
Cold or Dual Temperature heat exchangers.	Below 60°F (14°C)	1½" (40mm) applied in two (2) staggered ¾" (20mm) layers

2.05 E5 – LOW TEMPERATURE PHENOLIC BOARD

- .1 Application:
 - .1 Cold and Dual Temperature Equipment with service temperatures in the range of -100°F to 250°F (-73°C to 121°C)
- .2 Materials:
 - .1 to ASTM C1126 (Gr.1),
 - .2 rigid for flat surfaces,
 - .3 meeting 25/50 flame spread/smoke development when tested to ASTM E84,
 - .4 thermal performance: 0.145 btu/hr/in/sq ft/°F @ 50°F (0.021 W/m/°C@ 10°C)
 - .5 density: 2.3 lb/cu.ft (37 kg/cu.m)
- .3 Acceptable Manufacturers:
 - .1 Kingspan - Koolphen K
 - .2 Or equivalent
- .4 Table E5: Low Temperature Phenolic Board

TABLE E5: Low Temperature Phenolic Board		
Service	Operating Temperature Range	Thickness
Chilled water and glycol cooling system pumps	Below 60°F (14°C)	1" (25mm) with removable box
Cold water booster pumps	Below 60°F (14°C)	1" (25mm) with removable box
Chiller evaporator shell heads;	Below 60°F (14°C)	1" (25mm) with removable box
Chilled water and glycol cooling system storage tank	Below 60°F (14°C)	1" (25mm)
Cold or Dual Temperature heat exchangers.	Below 60°F (14°C)	1" (25mm)
Exterior louver blank-off panels	Below 60°F (14°C)	Two staggered layers of 2" (50mm) sandwiched between two sheets of 20 ga. Galvanized sheet metal

2.06 E6 – MINERAL WOOL FIBRE ROLL:

- .1 Application:
 - .1 Hot Equipment with service temperatures up to 1200°F (650°C)
- .2 Materials:
 - .1 to ASTM C553
 - .2 flexible faced industrial blanket,
 - .3 FRK and black scrim facing,
 - .4 thermal performance: 0.25 btu/hr/in/sq ft/°F @ 100°F (0.04 W/m/°C @ 50°C)
 - .5 density: 8.0 lb/cu.ft (128 kg/cu.m)
- .3 Acceptable Manufacturers:
 - .1 Roxul Enerwrap 80
 - .2 IIG MinWool-1200 Pipe and Tank
 - .3 Or equivalent
- .4 Table E6: Mineral Wool Fibre Roll

TABLE E6: Mineral Wool Fibre Roll		
Service	Operating Temperature Range	Thickness
Shell-and-Tube Heat exchangers	Up to 300°F (150°C)	1" (25mm)
Expansion tanks	Up to 300°F (150°C)	1" (25mm)
Domestic hot water tank & heaters	Up to 300°F (150°C)	1" (25mm)
Any other Hot Equipment	Up to 300°F (150°C)	1½ " (40mm)
Any other Hot Equipment	Between 300°F to 750°F (150°C to 400 °C)	2" (50mm)

2.07 E7 – MINERAL WOOL FIBRE BOARD

- .1 Application:
 - .1 Hot Equipment with service temperatures up to 1200°F (650°C)
- .2 Materials:
 - .1 to ASTM C612
 - .2 rigid board
 - .3 thermal performance: 0.25 btu/hr/in/sq ft/°F @ 100°F (0.04 W/m/°C @ 50°C)
 - .4 density: 4.4 lb/cu.ft (70 kg/cu.m)
 - .5 Roxul RHT 60
 - .6 IIG MinWool-1200 Industrial Board
 - .7 Or equivalent
- .3 Table E7: Mineral Wool Fibre Board:

TABLE E7: Mineral Wool Fibre Board		
Service	Operating Temperature Range	Thickness
Plate-and-frame heat exchangers	Up to 300°F (150°C)	1" (25mm)
Boilers	Up to 300°F (150°C)	2" (50mm)
Any other Hot Equipment	Up to 300°F (150°C)	1½ " (40mm)
Any other Hot Equipment	Between 300°F to 750°F (150°C to 400 °C)	2" (50mm)

2.08 ADHESIVES, FASTENERS, AND TAPE

- .1 Contact bond cement:
 - .1 for quick setting for metal surfaces.
 - .2 85-20 asbestos free, 5sq.2/L
 - .3 Volatile Organic Content: maximum 80 g/L
 - .4 Acceptable Manufacturers:
 - .1 Bakor - No. 220-05
 - .2 Foster – Drion 85-75
 - .3 Armstrong: 520.
 - .4 Or equivalent
- .2 Lap seal adhesive:
 - .1 Quick-setting for joints and lap sealing of vapour barriers;
 - .2 asbestos free, 6 sq.m/L;
 - .3 Volatile Organic Content: maximum 250 g/L
 - .1 Bakor 220-05
 - .2 Childers CHIL-STIX FRN CP-82
 - .3 Foster 85-70
 - .4 Or equivalent
- .3 Fibrous insulation adhesive:
 - .1 Volatile Organic Content: maximum 250 g/L
 - .2 Acceptable Manufacturers:
 - .1 Childers CHIL-STIX FRN CP-82
 - .2 Foster No. 85-70
 - .3 Or equivalent
- .4 Vapour barrier tape:
 - .1 Self Adhesive: 4" (100mm) wide.
 - .2 colour matched and foil faced
 - .3 UL 181A listed.
 - .4 Acceptable Manufacturers:
 - .1 Johns Manville - Zeston Z-Tape
 - .2 MacTac Canada Limited - Vinyl Scrim or Foil Scrim Kraft

- .3 Compac Corp.
 - .4 Fattal Canvas Inc. – Insultape
 - .5 Or equivalent
- .5 Weld Pins, Studs and Clips:
 - .1 Acceptable Manufacturers:
 - .1 Midwest Fasteners
 - .2 Continental Studwelding
 - .3 Or equivalent
- .6 Staples:
 - .1 Monel, flare type, minimum size ½" (12mm)
- .7 Tie Wire
 - .1 16 ga (1.6mm) stainless steel with twisted ends.
- .8 Caulking for equipment jackets (outdoor use only):
 - .1 fast-drying, aluminum colour finish, flexible butyl elastomer based vapour barrier sealant.
 - .2 Acceptable Manufacturers:
 - .1 Foster 95-44
 - .2 Or equivalent

2.09 COATINGS AND MEMBRANES

- .1 Reinforcing Membrane:
 - .1 synthetic fibre:
 - .1 Leno weave,
 - .2 indoor and outdoor use.
 - .3 Acceptable Manufacturers
 - .1 Foster Mast-A-Fab
 - .2 Or equivalent
 - .2 glass-fibre fabric:
 - .1 indoor use.
 - .2 Acceptable Manufacturers
 - .1 Childers Chil-Glas #5/#10
 - .2 Or equivalent
 - .3 glass-fibre fabric for use with elastomeric closed cell foam:
 - .1 indoor use.
 - .2 Acceptable Manufacturers
 - .1 Childers Chil-Glass #10
 - .2 Or equivalent
- .2 Breather Coating - Indoors:
 - .1 for breather coatings and lagging adhesive,
 - .2 Volatile Organic Content: maximum 50 g/L
 - .3 white in colour,
 - .4 for insulation except elastomeric closed cell foam.

- .5 Acceptable Manufacturers
 - .1 Childers CP-50A HV2
 - .2 Foster 30-36
 - .3 Or equivalent
- .3 Breather Mastic - Outdoors:
 - .1 for breather coatings and lagging adhesive,
 - .2 abrasion resistive, flexible,
 - .3 UV stabile,
 - .4 grey in colour.
 - .5 Acceptable Manufacturers:
 - .1 Childers Vi-Cryl CP-10/11
 - .2 Foster 35-00 / 45-00
 - .3 Bakor 120-10
 - .4 Or equivalent
- .4 Vapor Barrier Coatings - Indoors:
 - .1 Volatile Organic Content: maximum 50 g/L.
 - .2 for vapor barrier coatings and lagging adhesive except for elastomeric closed cell foam,
 - .1 permeance rating 0.02 perms maximum,
 - .2 white in colour
 - .3 Acceptable Manufacturers:
 - .1 Childers Chil Perm CP-34/35
 - .2 Foster 30-80, 30-90
 - .3 Or equivalent
 - .4 for use with elastomeric closed cell foam.
 - .1 Acceptable Manufacturers:
 - .1 Childers CHIL-SPRAY WB CP-56 Adhesive
 - .2 Or equivalent
- .5 Vapor Barrier Mastic - Outdoors:
 - .1 for vapor barrier coatings and lagging adhesive,
 - .2 asphalt cutback,
 - .3 permeance rating 0.02 perms maximum,
 - .4 grey in colour.
 - .5 for outdoor use only; not rated to meet fire/smoke rating of 25/50.
 - .6 Acceptable Manufacturers:
 - .1 Childers Chil-Pruf CP-22
 - .2 Foster 60-25/60-26
 - .3 Or equivalent
- .6 Insulation Cement
 - .1 Hydraulic-setting finishing type.

2.10 FIELD APPLIED FINISHES

- .1 Fabric finish jacket:
 - .1 ULC listed plain weave cotton fabric at 6 oz/sq.yd (220 g/sq.m) treated with fire retardant lagging adhesive, or
 - .2 re-wettable fiberglass lagging fabric with water activated self-adhesive.
 - .3 suitable for field painting.
 - .4 Acceptable Manufacturers:
 - .1 Fattal's Thermocanvas
 - .2 Alpha-Maritex 3451-RW
 - .3 Clairmont Diplag 60
 - .4 Glass-Cell FR
 - .5 Newtex - Zetex Rewettable
 - .6 Or equivalent
- .2 PVC (Polyvinyl Chloride) finish jacket:
 - .1 minimum 20 mil thickness with permeability not more than 0.09 perms,
 - .2 flexible flat-sheet,
 - .3 Acceptable Manufacturers:
 - .1 Johns Manville - Manville Zeston 2000
 - .2 ACWIL Insulations
 - .3 Sure Fit Systems
 - .4 Proto PVC – LoSMOKE
 - .5 Or equivalent
 - .4 pressure sensitive, colour matching vinyl tape.
- .3 Metal finish jacket:
 - .1 Equipment:
 - .1 stucco embossed aluminum not less than 0.45 mm (0.016 in) thick sheet or,
 - .2 corrugated stainless steel not less than 0.25 mm (0.010 in) thick sheet.
 - .2 Fittings:
 - .1 Custom made swaged ring or lobster back covers on bends and die shaped fitting covers over fitting, valves, strainers, flanges, and grooved couplings.
 - .3 Bands:
 - .1 ½" (12mm) wide stainless steel with mechanical fasteners.
 - .4 Acceptable Manufacturers:
 - .1 Alcan Canada Products - Thermaclad Type 1
 - .2 Childers Products Inc. - Fab Straps
 - .3 Or equivalent
- .4 Self-adhesive weather barrier membrane (SAWB):
 - .1 self-adhering membrane of acrylic adhesive with siliconized release paper, not exceeding flame/smoke generation rating of 25/50, for indoor and outdoor use,
 - .2 self-adhering membrane of rubberized asphalt compound with siliconized release paper, for outdoor use only
 - .3 laminated to stucco-embossed aluminum foil,

- .4 self-sealing with penetration of self-tapping screws.
- .5 water vapour permeance 0.05 perms.
- .6 Acceptable Manufacturers:
 - .1 VentureClad 1579CW - indoor and outdoor applications
 - .2 Bakor - Foilskin - outdoor applications
 - .3 Polyguard Products Alumaguard 60 - outdoor applications
 - .4 Or equivalent
- .5 Protective finish for elastomeric cellular foam insulation
 - .1 indoors and outdoors:
 - .2 Acceptable Manufacturers:
 - .1 Armaflex WB Finish
 - .2 Or equivalent

2.11 REMOVABLE/REUSABLE HIGH TEMPERATURE INSULATION BLANKETS

- .1 custom fabricated single piece construction, removable insulation covers for hot surfaces,
- .2 suitable for outdoor use,
- .3 maximum touch-safe temperature protection: 203°F (95°C) (to UL2200.
- .4 insulation: high density, fire resistant mineral or fibreglass insulation suitable for system operating temperature.
- .5 cover: silicone impregnated fibreglass cover, for temperatures up to 500°F (260°C)
- .6 internal liner: silicone impregnated fibreglass fabric, or stainless steel knitted wire mesh.
- .7 metal identification tag, referenced equipment served.
- .8 tie-straps with D-rings, or Velcro™ closures.
- .9 Acceptable Manufacturers:
 - .1 Firwin Corporation
 - .2 Thermohelp Canada Inc.
 - .3 Or equivalent

2.12 RADIANT CEILING PANEL INSULATION:

- .1 Provision of insulation over radiant ceiling panels shall be by the Insulation Trades.
- .2 Insulation shall be foil faced back, mineral 2" (50mm).
- .3 Fibre blanket shall be in accordance with CGSB51-GP-1M and Amdt Apr.78 and GCSB51-GP-52M.

2.13 VINYL NOISE ATTENUATION WRAP:

- .1 1.0 lb/sq.ft non-lead loaded non-reinforced vinyl barrier sheets faced with a fibrous glass "scrim" reinforced aluminium foil facing on one side.
- .2 Thickness: 0.09"
- .3 Flammability: Must pass UL94V and FMVSS 302. Meet Class A flammability rating per ASTM E-84.
- .4 All hangers, support rods, concrete anchors shall be in accordance with manufacturers' Instructions.
- .5 Sound transmission loss requirements based on ASTM E90-09 and ASTM E413-04

TABLE 7 – Sound Transmission Loss (db per Centre Line Frequency)						
125 Hz	250 Hz	500 Hz	1000 Hz	2000 Hz	4000 Hz	STC
15	16	21	26	33	38	26

- .6 Acceptable Manufacturer (as listed or equal): EAR Specialty Composites Tufcote Noise Barrier Lag-10, Audioseal Sound Barrier AB10-Lag.

PART 3 - EXECUTION

3.01 GENERAL DESIGN AND PERFORMANCE REQUIREMENTS

- .1 Insulation Thickness: All plumbing piping to be insulated, including insulation for condensate drain piping from equipment drain pans, and refrigerant piping, shall be minimum 25 mm thick unless noted otherwise.
- .2 Performance Requirements: As a minimum, insulation application methods and standards shall be as per the NATIONAL INSULATION STANDARDS of the Thermal Insulation Association of Canada.
- .3 General Insulation Application Requirements: General requirements pertaining to the application of mechanical insulation are specified below. Unless otherwise specified, do not insulate the following:
 - .1 factory insulated equipment /plenums/ panels and piping;
 - .2 heated liquid system pump casings, valves, strainers and similar accessories;
- .4 Place insulation with joints staggered and tightly butted,
- .5 Secure insulation with:
 - .1 stainless steel bands 300 mm (12 in) on centre, or
 - .2 attach to equipment surfaces with adhesive, applied in strips 150 mm (6 in) wide at 300 mm (12 in) on centre.
 - .3 do not use weld pins on plate-and-frame heat exchangers.
- .6 Curved surfaces with radius less than 250 mm (10 in):
 - .1 insulate with type E-1, E-3, or E-6 insulation as shown.
- .7 Flat surfaces, and curved surfaces with radius 250 mm (10 in) and greater:
 - .1 insulate with type E-2, E-4, E-5, E-7 as shown.
 - .2 provide metal corner beads to reinforce corners and edges.
- .8 Irregular shaped surfaces (cold and dual temperature only):
 - .1 insulate with type E-1 or E-3 as shown,
 - .2 use preformed insulation fittings, mitred segments of board insulation, or flexible blanket insulation with portions built-up to specified thickness.
- .9 Nozzles, manholes, and access doors:
 - .1 terminate insulation with straight cut with space of 25 mm (1 in) at connection,
 - .2 seal cut with insulation coatings/mastic beveled away from flanged or union connections; and
 - .3 cover flanged joint, union, manhole and access doors with removable and replaceable aluminum insulated box overlapping adjacent insulation by 50 mm (2 in) and secured with bands.
- .10 Instruments and instrument sensor risers:
 - .1 tightly fit equipment insulation to instrument riser/piping,

- .2 in addition for cold and dual temperature equipment, insulate the instrument sensor riser for a length equal to four (4) times the diameter of the riser pipe.
- .11 Flanges and Mechanical Couplings: Terminate sectional insulation approximately 50 mm from the flange or coupling on each side of the flange or coupling. Cover the flange or coupling with a minimum 50 mm thickness of blanket mineral fibre insulation wide enough to butt tightly to the ends of the adjacent sectional insulation. Secure the blanket insulation in place and cover with a PVC cover.
- .12 For cold surfaces with the possibility of condensation, install insulation directly over pipes and ducts and not over hangers and supports.
- .13 For warm surfaces, line size hangers shall be permitted and insulation shall cover the hanger to maintain the specified thickness in accordance with ASHRAE 90.1.
- .14 On equipment insulation with vapour barriers, maintain integrity of vapour barrier without penetration.
- .15 Do not cover equipment nameplates with insulation. Do not allow insulation to interfere with the operation of mechanical equipment or the equipment of other Divisions.

3.02 SEALING INSULATION - HOT EQUIPMENT

- .1 Indoor installation:
 - .1 no sealing of insulation is required prior to application of finish protection.
- .2 Outdoor installation:
 - .1 apply breather mastic with reinforcing membrane over equipment insulation, regardless of final finish application.
 - .2 apply mastics when ambient temperature is above 40°F (4°C), unless manufacturer's instructions permit colder ambient installation conditions.

3.03 SEALING INSULATION - COLD AND DUAL TEMPERATURE EQUIPMENT

- .1 Type E1, E2, and E5 insulation - indoor and outdoor installation:
 - .1 apply vapor barrier coating/mastic with reinforcing membrane over equipment insulation, regardless of final finish application.
 - .2 only use mastics on outdoor installations.
 - .3 apply mastics and coatings when ambient temperature is above 4°C (40°F), unless manufacturer's instructions permit colder ambient installation conditions.
 - .4 at pipe connections, cut-back insulation and seal with coating/mastic; insulate pipe flanges in accordance with requirements for piping insulation.
 - .5 at instruments and instrumentation sensor riser, cut-back and seal insulation with coating/mastic at riser, and seal sensor riser insulation.
- .2 Type E3 (flexible elastomeric closed cell foam) insulation - indoor installation:
 - .1 seal transverse and butt joints with sealer/adhesive.

3.04 INSULATION FINISH

- .1 Install protective finish on insulation in accordance with Equipment Insulation Protective Finishes Table herein, after breather and vapour barrier sealing is completed.
- .2 Install finish jacket materials used for covering to allow 50 mm to 100 mm (2 in to 4 in) overlap on longitudinal and circumferential edges.
- .3 On vertical tanks, vessels, and similar equipment. arrange circumferential overlap on adjacent sheets outside of sheet below and under sheet above.
- .4 PVC sheeting :
 - .1 Hot Equipment:

- .1 overlap longitudinal edges and adjacent sheets by minimum of 2" (50mm) and staple fasten the sheets.
 - .2 secure sheeting with colour matched tape around circumference, at least two places per section of sheet, and by stapling longitudinal and circumferential edges.
 - .3 do not seal edges with vapour barrier tape.
- .2 Cold and Dual Temperature Equipment:
 - .1 overlap longitudinal edges and adjacent sheets by minimum of 50 mm (2 in) and seal longitudinal edges with vapor barrier coating adhesive for full depth and 100% coverage of overlap,
 - .2 seal circumferential edges of PVC fitting covers with reinforced vapour barrier coating adhesive extending over adjacent pipe insulation section with an overlap of at least 50 mm (2 in).
 - .3 seal PVC fitting covers at throat and heel seams by solvent bonding and secured over insulation with reinforced vapor barrier coating/mastic overlapping adjacent pipe insulation a minimum of 2" (50mm).
- .5 Metal:
 - .1 Use lock-on systems or secure sheeting with bands 18" (450mm) apart.
 - .2 Joint sealing:
 - .3 Hot equipment: do not seal joints.
 - .4 Cold and Dual Temperature equipment: seal joints with caulking.
 - .5 Curved surfaces: custom made swaged ring or lobster back covers.
 - .6 On outdoor hot and cold/dual temperature equipment, caulk overlapping metal joints to permit expansion of metal jacket.
- .6 Fabric:
 - .1 Cotton lagging:
 - .1 apply cotton lagging with minimum two coatings of breather or vapor barrier coating adhesive as applicable to the piping system, and finish to provide a smooth surface free of wrinkles and sags.
 - .2 where cotton lagging with appropriate coating is used this satisfies the requirements of a sealer coating for Hot or Cold/Dual temperature piping systems.
 - .2 Fibreglass lagging:
 - .1 apply re-wettable fiberglass lagging in accordance with manufacturer instructions. Finish to provide a smooth surface free of wrinkles and sags.
 - .2 where re-wettable fiberglass lagging is used this satisfies the requirements of a sealer coating for Hot piping systems.
 - .3 Type E3 (flexible elastomeric closed cell foam) insulation:
 - .1 apply thin coat of lagging adhesive, and apply glass mesh,
 - .2 when dry apply indoor or outdoor finish at 400 square feet per gallon,
 - .3 apply second coat of same material, at same rate of application, after four hours.
- .7 Equipment Insulation Protective Finishes Table

Equipment Insulation Protective Finishes Table				
Location	Weather Exposure	System/Space	Finish	Insulation Type
Concealed	Indoors	All	Fabric	E1, E2, E4, E5, E6, E7, E8, E9
Exposed	Indoors	Service Rooms	Fabric or PVC	E1, E2, E4, E5, E6, E7, E8, E9
	Indoors	Public Spaces	PVC	E1, E2, E4, E5, E6, E7, E8, E9
	Outdoors	All	Metal	E1, E2, E4, E5, E6, E7, E8, E9
	Outdoors	All	SAWB	E1, E2, E4, E5, E6, E7, E8, E9

3.05 CENTRIFUGAL REFRIGERATION MACHINES

- .1 insulate evaporator shell with two staggered layers of $\frac{3}{4}$ " (20mm) type E-3 insulation adhered to clean oil-free metal surfaces by compression fit method with full coverage of adhesive.
- .2 Insulate refrigeration machine evaporator heads and water boxes with removable, replaceable insulated boxes consisting of:
 - .1 16 ga. (1.6mm) aluminum or stainless steel sheeting, with edges and corners caulked and sealed;
 - .2 lined with $1\frac{1}{2}$ " (40mm) of two layers $\frac{3}{4}$ " (20mm) thick type E-3, or one layer 1" (25mm) thick E-4 insulation;
 - .3 vapour seal joints between adjacent casing sections after box is in place, and;
 - .4 attach boxes so that they may be removed without disturbing casing insulation.

3.06 FIELD APPLIED FINISHES

- .1 Fabric finish jacket application: All exposed insulated equipment (except chiller) including:
 - .1 heat exchangers;
 - .2 storage tanks;
 - .3 air separators;
 - .4 deaerator tanks;
 - .5 blowdown tanks;
 - .6 condensate receivers;
 - .7 flash tanks.

3.07 MECHANICAL DAMAGE PROTECTION - INDOORS

- .1 Protect exposed insulated equipment floor supports with 18 ga. (1.2 mm) stainless steel jacket approximately 4" (100mm) high, secured to floor slab. Conceal fastenings by floor plate.

3.08 FIELD INSPECTION QUALITY CONTROL

- .1 The Consultant reserves the right to have protective finish coverings removed on up to 5% of all fittings, flanges, couplings, and accessories to review the sealing of the insulation, at no change in cost.
- .2 Upon inspection, if insulation sealing is found to be incorrect at any one, the Consultant, in their sole discretion, may call for the removal of the protective finish on all fittings, flanges, couplings, and accessories for further review.
- .3 Repair defective sealing and replace protective coverings at no additional cost to the Owner.

PART 1 - GENERAL

1.01 GENERAL REQUIREMENTS

- .1 Comply with requirements of the Owner's General Requirements and all documents referred to therein.
- .2 Comply with requirements of Section 20 01 10 Mechanical General Requirements.
- .3 Comply with requirements of Section 20 01 50 Basic Materials and Methods.
- .4 Comply with the requirements of Section 20 05 05 Mechanical Demolition

1.02 SCOPE OF WORK

- .1 Demolition and removal of existing pipe insulation.
- .2 Generally piping to be insulated shall include, but not limited to, the following:
 - .1 potable and non-potable cold water piping;
 - .2 potable and non-potable hot water piping, supply and recirculation;
 - .3 tempered potable and non-potable water piping, supply and return;
 - .4 storm drainage piping from roof drains to the point where main vertical risers extend straight down, without offsets, and connect to horizontal mains;
 - .5 condensate drainage piping from air conditioning equipment drain pans;
 - .6 chilled water piping, supply and return;
 - .7 hot water heating piping, supply and return;
 - .8 glycol solution heating or heat reclaim piping, supply and return;
 - .9 chilled glycol solution piping, supply and return
 - .10 steam piping;
 - .11 condensate piping;
 - .12 all piping located outside building or inside building in unheated areas and indicated to be traced with electric heating cable;
 - .13 air compressor set fresh air intake piping;
 - .14 refrigerant piping;
 - .15 Refer to Insulation Thickness Tables herein and Part 3 of these Specifications for additional requirements.
- .3 Finishes for Insulation shall include, but not limited to, the following:
 - .1 Canvas: Unless otherwise specified or required, jacket all exposed calcium silicate insulation, exposed mineral fibre duct, plenum and casing insulation, and mineral fibre equipment insulation with canvas;
 - .2 PVC: Unless otherwise specified or required, jacket all exposed pipe insulation other than calcium silicate and flexible elastomeric where inside the building with white sheet PVC and PVC fitting covers;
 - .3 Aluminum: Unless otherwise specified or required, jacket all pipe insulation outside the building with aluminum;
 - .4 Protective Coatings: Unless otherwise specified or required, apply a protective coating to all flexible elastomeric insulation. Apply one (1) coat where inside the building and two (2) coats where outside the building.

1.04 DEFINITIONS

- .1 "Ambient": as applied to temperatures means outdoor design temperature.
- .2 "Concealed": as applied to mechanical services and equipment located in space above opaque suspended ceilings, and within trenches not in boiler rooms, pipe and/or duct shafts, and non-accessible chases and furred spaces.
- .3 "Exposed": as applied to remainder of mechanical services and equipment which are not "concealed" as defined above. For greater certainty, the following locations are Exposed:
 - .4 Services in tunnels,
 - .5 Services in space beneath raised floors.
 - .6 Trenches located in boiler rooms.
- .7 "Conditioned air": air supplied from air handling units which heats, cools, dehumidifies, or humidifies the air.
- .8 "Unconditioned space": rooms or spaces that are not supplied with conditioned air, including ceiling spaces which are not part of a ceiling return plenum system
- .9 "Outdoor": mechanical services and equipment located outside of the building envelope including services located beneath overhangs and soffits, and exposed to any outdoor condition including temperature, sun exposure, or precipitation.
- .10 "Mastic": heavy-consistency waterproof compound for outdoor applications used in conjunction with reinforcing fabric that remains adhesive and generally pliable with age, to provide either a breathable or vapour barrier finish to insulation.

- .11 "Coating": light-consistency compound for indoor applications used in conjunction with reinforcing fabric, to provide either a breathable or vapour barrier finish to insulation.
- .12 "Finish Jacket": final finish protective layer for insulation, including lagging fabric, PVC, metal, and adhesive films; that provides weather-protective finish depending on application.
- .13 "Service temperature": for purpose of piping temperature, is equal to the gas or vapour design operating temperature, or the liquid supply operating temperature.
- .14 "Pure water": water which has been treated with filtration equipment, including but not limited to reverse osmosis, deionization, ultra-filtration, ultra-violet, distillation or any combination of such or similar equipment, to achieve water quality significantly free of impurities.

1.05 QUALITY ASSURANCE

- .1 Qualifications: Execute work of this section only by skilled tradesmen regularly employed in the application of insulation to piping, ductwork, and equipment for building fire protection, plumbing and drainage, heating, cooling, and ventilating systems.
- .2 Insulation, self-adhesive tape, adhesives and any insulation finishes to be ULC labelled and listed for flame spread rating of less than 25 and smoke development classification of less than 50.
- .3 Insulating Trades performing the work shall be a member in good standing of the Thermal Insulation Association of Canada.
- .4 Acceptable Manufacturers:
 - .1 Insulation: Fiberglas Canada Inc., Knauf Fiber Glass, Manson, Roxul, or equivalent.
 - .2 Tape: Avery Dennison, Mactac, Tuck, Compac, or equivalent.
 - .3 Canvas: Fattal hermocanvas, Alpa-Maritex 3451-RW, Clairmont Diplag 60, or equivalent.
 - .4 Lagging adhesive: Childers CP.50A-HV2, Fosters 30-36 asbestos free, or equivalent.

1.06 SITE VISIT

- .1 Visit the site prior to tender and verify all conditions. Prior to submitting price, the Mechanical Division Contractor is to review all discrepancies and verify the locations of all existing services that are being extended and the routing of new services. Also report all ambiguities, discrepancies, departures from building by-laws and/or from good practice. Failure to do so will result in all additional costs being the responsibility of the Mechanical Division Contractor. Include for any alternate routing of new or rerouting of existing services to accommodate all site conditions in the tender price.

1.07 VOC REQUIREMENTS

- .1 All adhesives, sealants, paints and coatings used on or inside of building weatherproofing layer shall have a VOC content that is less than the content limits defined in LEED Product Requirements.

PART 2 - PRODUCTS

2.01 PIPING INSULATION SELECTION

- .1 Insulate Hot Piping where surface temperature of equipment in normal service is greater than 122°F (50°C) in accordance with this Section.
- .2 Insulate Cold and Dual Temperature Piping where surface temperature of equipment in normal service is less than 60°F (14°C) in accordance with this Section complete with a vapour barrier jacket.
- .3 Insulation shall be provided to ensure maximum piping surface temperature does not exceed 110°F (44°C). Where ASTM C1055 "Standard Guide for Heated System Surface Conditions that Produce Contact Burn Injuries" allows for surface temperatures to be exceeded, submit for Consultant review the Insulation Trades Value Engineering proposal to reduce the extent of insulation, including a corresponding savings to the Owner. Under no circumstances shall surface temperature on the outside of insulation exceed 150°F (66°C) when piping system is operating under design service conditions.

- .4 Insulation, self-adhesive tape, adhesives and any insulation finishes to be ULC labelled and listed for flame spread rating of less than 25 and smoke development classification of less than 50.

2.02 P1 – FORMED FIBROUS GLASS:

- .1 Application:
 - .1 Pipe size application: up to and including **NPS 24"**
 - .2 Factory molded rigid pipe insulation system P1 **for hot system piping, valves, and fittings.**
- .2 Material(s):
 - .1 Insulate all piping with a preformed fiberglass pipe insulation, complying with **ASTM C 547**, Class 3 to 850°F. (454°C.), rigid, moulded pipe insulation, non-combustible and conforming with the following:
 - .1 reduced environmental impact feature of either: bio-based binders, 25% minimum recycled glass content, and/or paper-free ASJ jacket material.
 - .2 thermal performance: 0.23 btu/hr/in/sq ft/°F @ 75°F (0.033 W/m/°C @ 24°C)
 - .3 service temperature: -18°C (0°F) to jacket surface temperature (air contact) of 66°C (150°F) and un-jacketed surface temperature (equipment contact) up to 232°C (450°F).
 - .4 noncombustible meeting 25/50 flame spread/smoke developed when tested to ASTM E84, UL 723 and NFPA 255;
 - .5 when used over stainless steel, product must comply with ASTM C795 "Standard Specification for Thermal Insulation for Use in Contact with Austenitic Stainless Steel".
- .3 Vapour Retardant Jacketing:
 - .1 ASJ white jacket of "KRAFT" paper-free bonded to aluminum foil reinforced with glass fibre yarn and self-sealing longitudinal laps and butt strips, maximum 0.02 perms to ASTM E96 Procedure A.
- .4 Acceptable Manufacturers:
 - .1 Fiberglass Canada: 850 with ASJ-SSL Jacket,
 - .2 Manson: Alley K with all-purpose APT Jacket,
 - .3 Knauf Fiberglass Redi-Klad 1000 Ecosse (bio-based binders)
 - .4 John Manville Micro-Lok HP (25% recycled content)
 - .5 Owens Corning Fiberglas Evolution (paper-free ASJ)
 - .6 Or Equivalent
- .5 Table P1 – Formed Fibrous Glass Insulation Thicknesses:

TABLE P1- Formed Fibrous Glass Insulation Thicknesses							
Service	Fluid Design Operating Temperature Range	Insulation Thickness Based On Nominal Pipe Size (in.)					
		Runouts Up to 2"	1" & less	1-1/4" to 2"	2-1/2" to 4"	6"	8" & larger
Dom. Hot Water & Recirc Piping & Tempered Water	Up to 180°F Up to 82°C	1.0" 25mm	1.0" 25mm	1.0" 25mm	1.5" 40mm	1.5" 40mm	1.5" 40mm
Hot water Heating, Glycol and Reheat, Snow Melting, Heat Recovery	Up to 200°F. Up to 93°C.	1.0" 25mm	1.5" 40mm	1.5" 40mm	1.5" 40mm	1.5" 40mm	1.5" 40mm
Humidification	Up to 250°F. Up to 121°C.	1.0" 25mm	1.5" 40mm	1.5" 40mm	2.0" 50mm	2.0" 50mm	3.5" 90mm
Condensate Lines (Low Pressure)	Up to 200°F. Up to 93°C.	0.5" 12mm	1.5" 40mm	1.5" 40mm	1.5" 40mm	1.5" 40mm	1.5" 40mm
Equipment Drain Lines, Safety Valve Vents, etc.	Up to 200°F. Up to 93°C.	0.5" 12mm	1.5" 40mm	1.5" 40mm	1.5" 40mm	1.5" 40mm	1.5" 40mm
Drains Under Counter	Up to 180°F. Up to 82°C	n/a	1.0" 25mm	1.0" 25mm	1.0" 25mm	n/a	n/a
Notes: (1) Insulation exposed to exterior shall be double the stipulated thickness in two staggered layers. (2) Steam Lines: For steam pressures not listed above, use insulation thickness as specified for the next higher pressure listed.							

2.03 P2 – FORMED FIBROUS GLASS WITH VAPOUR BARRIER:

- .1 Application:
 - .1 Pipe size application: up to and including **NPS 24"**
 - .2 Insulation System P2 for cold and dual temperature (hot and cold) system piping, valves and fittings.
- .2 Material(s):
 - .1 Insulate all piping with a preformed fiberglass pipe insulation, complying with **ASTM C 547**, Class 3 to 850°F. (454°C.), rigid, moulded pipe insulation, non-combustible and conforming with the following:
 - .1 reduced environmental impact feature of either: bio-based binders, 25% minimum recycled glass content, and/or paper-free ASJ jacket material.
 - .2 thermal performance: 0.23 btu/hr/in/sq ft/°F @ 75°F (0.033 W/m/°C @ 24°C)
 - .3 service temperature: -18°C (0°F) to jacket surface temperature (air contact) of 66°C (150°F) and un-jacketed surface temperature (equipment contact) up to 232°C (450°F).
 - .4 noncombustible meeting 25/50 flame spread/smoke developed when tested to ASTM E84, UL 723 and NFPA 255;

- .5 when used over stainless steel, product must comply with ASTM C795 "Standard Specification for Thermal Insulation for Use in Contact with Austenitic Stainless Steel".
- .3 Vapour Retardant Jacketing:
 - .1 ASJ white jacket of "KRAFT" paper-free bonded to aluminum foil reinforced with glass fibre yarn and self-sealing longitudinal laps and butt strips, maximum 0.02 perms to ASTM E96 Procedure A.
- .4 Acceptable Manufacturers:
 - .1 Fiberglass Canada: 850 with ASJ-SSL Jacket,
 - .2 Manson: Alley K with all-purpose APT Jacket,
 - .3 Knauf Fiberglass Redi-Klad 1000 Ecosse (bio-based binders)
 - .4 John Manville Micro-Lok HP (25% recycled content)
 - .5 Owens Corning Fiberglas Evolution (paper-free ASJ)
 - .6 Or Equivalent
- .5 Table P2 – Formed Fibrous Glass with Vapour Barrier Insulation Thicknesses:

TABLE P2- Formed Fibrous Glass with Vapour Barrier Insulation Thicknesses							
Service	Fluid Design Operating Temperature Range	Insulation Thickness Based On Nominal Pipe Size (in.)					
		Runouts Up to 2"	1" & less	1-1/4" to 2"	2-1/2" to 4"	6"	8" & larger
Domestic Cold Water, RO Water, DI Water, Softened Water, Dialysis Water	40 to 50°F (4 to 10°C)	1.0" 25mm	1.0" 25mm	1.0" 25mm	1.0" 25mm	1.5" 40mm	1.5" 40mm

2.04 P3 - GLASS FIBRE SEMI-RIGID BOARD

- .1 Application for hot system piping, valves, and fittings as follows:

- .1 pipe size application: **NPS 16" and larger:**
- .2 service temperature: up to 454°C (850°F)
- .2 Material:
 - .1 to ASTM C795,
 - .2 scored and folded board,
 - .3 ASJ jacket of kraft bonded to aluminum foil reinforced with glass fibre yarn, maximum 0.02 perms to ASTM E96 Procedure A.
 - .4 noncombustible meeting 25/50 flame spread/smoke developed when tested to ASTM E84,
 - .5 thermal performance: 0.35 btu/hr/in/sq ft/°F @ 200°F (0.050 W/m/°C @ 93°C)
 - .6 vapor transmission : maximum 0.02 perms
- .3 Acceptable manufacturers:
 - .1 John Manville Spin-Glas 813
 - .2 Owens Corning Pipe and Tank
 - .3 Knauf Fibreglass Pipe and Tank
 - .4 Or equivalent
- .4 Vapour Retardant Jacketing:
 - .1 White "KRAFT" paper-free reinforced with a glass fibre yarn and bonded to an aluminium foil, with self-sealing longitudinal laps and butt strips.
- .5 Table P3 –Glass Fiber Semi-Rigid Board Insulation Thicknesses:

TABLE P3- Glass Fiber Semi-Rigid Board Insulation Thicknesses							
Service	Fluid Design Operating Temperature Range	Insulation Thickness Based On Nominal Pipe Size (in.)					
		Runouts Up to 2"	1" & less	1-1/4" to 2"	2-1/2" to 4"	6" to 14"	16" & larger
Steam and Condensate ≤ 15 psi (100 kPa)	201 to 250°F (94 to 121°C)	---	n/a	n/a	n/a	n/a	3.5" 90mm
Safety relief piping	251 to 350°F (122 to 176°C)	---	n/a	n/a	n/a	n/a	3.5" 90mm

2.05 P4 – FLEXIBLE FIBROUS GLASS BLANKET WITH VAPOUR BARRIER:

- .1 Application:
 - .1 Blanket type roll insulation for **cold and dual temperature (hot and cold) system piping, valves and fittings.**
- .2 Material(s):
 - .1 CGSB 51-GP-11M+Amdt-Apr-78, mineral fibre blanket for piping and CGSB 51-GP-52M vapour barrier jacket and facing material.
 - .2 24 kg/cu.m density;

- .3 installed "RSI" value of 0.83 sq.m°C/W;
- .4 factory applied vapour barrier facing;
- .5 noncombustible meeting 25/50 flame spread/smoke developed when tested to ASTM E84.
- .3 Acceptable Manufacturers:
 - .1 Fiberglass Canada;
 - .2 Manson;
 - .3 Knauf;
 - .4 Or equivalent.
- .4 Thickness:
 - .1 Table 3 – Flexible Fibrous Glass With Vapour Barrier-Insulation follows:

TABLE P4 – Flexible Fibrous Glass with Vapour Barrier		
Service	Line Size Nominal	Thickness
Underside of roof drain body	All Sizes	1" (25mm)

2.06 P5 – FLEXIBLE FOAM ELASTOMERIC CLOSED CELL

- .1 Application:
 - .1 Preformed flexible elastomeric closed cell insulation for installation on **cold and dual temperature (hot and cold) system piping, valves and fittings.**
- .2 Material(s):
 - .1 to ASTM C534 "Standard Specification for Preformed Flexible Elastomeric Cellular Thermal Insulation in Sheet and Tubular Form"
 - .2 thermal performance: 0.04 W/m°C @ 24°C (0.28 btu/hr/in/sq ft°F @ 75°F) established in accordance with ASTM C 177 "Standard Test Method for Steady-State Heat Flux Measurements and Thermal Transmission Properties by Means of the Guarded-Hot-Plate Apparatus" or ASTM C 518 "Standard Test Method for Steady-State Thermal Transmission Properties by Means of the Heat Flow Meter Apparatus";
 - .3 CAN2-51.40-M80+Amendment-Aug-83 "Thermal Insulation, Flexible, Elastomeric, Unicellular, Sheet and Pipe Covering", flexible fire retardant elastomeric unicellular sheet and pipe covering;
 - .4 pipe size application: up to and including **NPS 6"**
 - .5 service temperature: -40°F to 203°F (-40°C to 95°C)
 - .6 tubular with self-sealing seams
 - .7 noncombustible meeting 25/50 flame spread/smoke developed when tested to ASTM E84,
 - .8 a water vapour transmission rating of 0.08 in accordance with ASTM E96-90, Procedure A;
 - .9 manufacturer specific sealer/adhesive.
- .3 Acceptable manufacturers:
 - .1 ARMACELL - AP Armaflex SS Pipe Insulation
 - .2 Johns Manville.
 - .3 Rubatex
 - .4 Or equivalent
- .4 Table P5 – Flexible Elastomeric Insulation Thickness:

TABLE P5- Flexible Elastomeric Insulation Thickness							
Service	Fluid Design Operating Temperature Range	Insulation Thickness Based On Nominal Pipe Size (in.)					
		Runouts Up to 2"	1" & less	1-1/4" to 2"	2-1/2" to 4"	6"	8" and larger
Refrigeration suction and hot gas lines (also see architectural drawings for walk-in freezers/coolers location);	-40°F to 203°F (-40°C to 95°C)	---	1.5" 40mm	1.75" 45mm	2.0" 50mm	2.0" 50mm	---
chilled water piping connections to chiller;	40°F to 65°F (4°C to 18°C)	---	1.0" 25mm	1.0" 25mm	1.0" 25mm	1.0" 25mm	---
chilled water pot feeder and filter.	40°F to 65°F (4°C to 18°C)	---	1.0" 25mm	1.0" 25mm	1.0" 25mm	1.0" 25mm	---
Equipment Drains	40 to 65°F (4 to 18°C)	---	0.75" 20mm	0.75" 20mm	0.75" 20mm	0.75" 20mm	---

2.07 P6 - MOLDED PHENOLIC RIGID

- .1 Application:
 - .1 For use in high humidity environments.
 - .2 factory made insulation pieces, each consisting of longitudinally split phenolic foam insulation molded pipe, fitting, and hanger support inserts on hot, cold and dual temperature piping to thickness noted in Table P6, or to match the adjacent insulation at hangers and supports, whichever is greater.
 - .3 pipe size application: up to and including **NPS 24"**.
 - .4 service temperature: -100°F to 250°F (-73°C to +121°C)
 - .5 a vapour barrier jacket with overlap flap, and an integral steel shield at hangers and supports
- .2 Material:
 - .1 to ASTM C1126 (Gr.1),
 - .2 noncombustible meeting 25/50 flame spread/smoke developed when tested to ASTM E84,
 - .3 thermal performance: 0.13 btu/hr/in/sq ft/F° @ 75°F (0.019 W/m/C° @ 24°C),
 - .4 density: 120 kg/cu.m (7.5 lb/cu.ft)
- .3 Acceptable manufacturers:
 - .1 Kingspan - Kooltherm K/Kooltherm High Density
 - .2 Or equivalent
- .4 Table P6 - Molded Phenolic Insulation Thickness:

TABLE P6 – Molded Phenolic Rigid Insulation Thickness							
Service	Fluid Design Operating Temperature Range	Insulation Thickness Based On Nominal Pipe Size (in.)					
		Runouts Up to 2"	1" & less	1" to 1¼ "	1½ " to 3"	4" to 6"	8" & larger
Safety relief piping	251 to 350°F 122 to 176°C	---	2.0" 50mm	2.5" 65mm	3.0" 75mm	3.5" 90mm	3.5" 90mm
Hot Water Heating	141 to 200°F (61 to 93°C)	---	0.75" (20mm)	1" (25mm)	1" (25mm)	1" (25mm)	1" (25mm)
Glycol Heating	141 to 200°F (61 to 93°C)	---	0.75" (20mm)	1" (25mm)	1" (25mm)	1" (25mm)	1" (25mm)
Low Temperature Hot Water Heating	105 to 140°F (40 to 60°C)	---	0.75" (20mm)	0.75" (20mm)	0.75" (20mm)	1" (25mm)	1" (25mm)

Domestic Cold Water	40 to 65°F (4 to 18°C)	---	---	---	1" (25mm)	1" (25mm)	1" (25mm)
Non-potable cold water	40 to 65°F (4 to 18°C)	---	---	---	1" (25mm)	1" (25mm)	1" (25mm)
Drainage	40 to 65°F (4 to 18°C)	---	---	---	1" (25mm)	1" (25mm)	1" (25mm)
Chilled Water	40 to 65°F (4 to 18°C)	---	1" (25mm)	1" (25mm)	1" (25mm)	1" (25mm)	1" (25mm)

TABLE P6 – Molded Phenolic Rigid Insulation Thickness							
Service	Fluid Design Operating Temperature Range	Insulation Thickness Based On Nominal Pipe Size (in.)					
		Runouts Up to 2"	1" & less	1" to 1¼ "	1½ " to 3"	4" to 6"	8" & larger
Dual Temperature Heating/Cooling	40 to 65°F (4 to 18°C)	---	1" (25mm)	1" (25mm)	1" (25mm)	1" (25mm)	1" (25mm)
Refrigerant Suction	-40°F to 203°F (-40°C to 95°C)	---	1" (25mm)	1" (25mm)	1" (25mm)	1" (25mm)	1" (25mm)

2.08 P7 – CALCIUM SILICATE

- .1 Application:
 - .1 Boiler beaching and generator exhaust piping and muffler where no prefabricated double wall system has been specified in the documents.
- .2 Material(s):
 - .1 preformed, rigid, hydrous calcium silicate pipe and block, asbestos free, complying with:
 - .1 ASTM C533 "Standard Specification for Calcium Silicate Block and Pipe Thermal Insulation", Type 1, to 1200°F. (640°C.);
 - .2 CAN/CGSB 51.2 "Calcium Silicate Thermal Insulation for Piping, Machinery and Boilers"
 - .2 pipe size application: up to and including **NPS 24"**;
 - .3 service temperature: to 649°C (1200°F);
 - .4 thermal performance: 0.058 W/m°C @ 149°C (0.40 btu/hr/in/sq ft/°F @ 300°F);
 - .5 density 232 kg/cu.m (14.5 lb/cu ft);
 - .6 compressive strength of 160 psi at 5% compression;
 - .7 molded or block type;
 - .8 asbestos-free;
 - .9 when used over stainless steel, product must comply with the requirements of ASTM C795, MIL-I-24244 or NRC 1.36;
 - .10 product shall carry a 0/0 Flame Spread/Smoke Developed rating as tested in accordance with ASTM E84/NFPA 255/UL 723;
 - .11 product shall be rated as non-combustible as tested per ASTM E136.
 - .12 Acceptable manufacturers:
 - .1 Industrial Insulation Group - Thermo-12/Blue
 - .2 Kaylo-10;
 - .3 Manson;
 - .4 Knauf;
 - .5 Johns Manville;

.6 Or equivalent

.3 Table P7 – Calcium Silicate Insulation thickness as follows:

TABLE P7 - Calcium Silicate Insulation Thickness							
Service	Fluid Design Operating Temperature Range	Insulation Thickness Based On Nominal Pipe Size (in.)					
		Runouts Up to 2"	1" & less	1" to 1¼ "	1½ " to 3"	4" to 6"	8" & larger
Safety relief piping	251 to 350°F (122 to 176°C)	--	2" (50mm)	2.5" (65mm)	3" (75mm)	3.5" (90mm)	3.5" (90mm)

2.09 P8 - MOLDED MINERAL WOOL FIBRE:

.1 Application:

- .1 pre-moulded mineral fibre: rigid, sectional glass fibre or mineral wool sleeve type insulation pipe size application: up to and including **NPS 30"**,
- .2 service temperature: up to **650°C (1200°F)**,

.2 Material:

- .1 to ASTM C547,
- .2 thermal performance: 0.25 btu/hr/in/sq ft/F @ 100°F (0.042 W/m/C @ 50°C),
- .3 a factory applied vapour barrier jacket;

.3 Acceptable manufacturers:

- .1 Roxul Techton 1200
- .2 Fibrex Coreplus 1200 Pipe Insulation
- .3 Or equivalent

.4 Table P8 – Molded Mineral Wool Fiber Insulation Thickness:

TABLE P8- Molded Mineral Wool Fiber Insulation Thickness							
Service	Fluid Design Operating Temperature Range	Insulation Thickness Based On Nominal Pipe Size (in.)					
		Runouts Up to 2"	1" & less	1-1/4" to 2"	2-1/2" to 4"	6"	8" & larger
Safety relief piping	251 to 350°F 122 to 176°C	---	2.0" 50mm	2.5" 65mm	3.0" 75mm	3.5" 90mm	3.5" 90mm
Hot Water Heating	141 to 200°F (61 to 93°C)	---	1.5" 40mm	1.5" 40mm	1.5" 40mm	1.5" 40mm	1.5" 40mm
Glycol Heating	141 to 200°F (61 to 93°C)	---	1.5" 40mm	1.5" 40mm	1.5" 40mm	1.5" 40mm	1.5" 40mm

2.10 BARRIER FREE LAVATORY INSULATION KITS

- .1 Removable, flexible, reusable, white molded plastic insulation kits for a handicapped lavatory drain piping and potable water supplies exposed under the lavatory.

2.11 ADHESIVES, FASTENERS, AND TAPE

- .1 Contact bond cement:

- .1 10 Flame Spread and 0 Smoke Developed ratings.
- .2 for quick setting for metal surfaces.
- .3 Volatile Organic Content: maximum 80 g/L.
- .4 Acceptable manufacturers:
 - .1 Bakor - No. 220-05
 - .2 Foster – Drion 85-75
 - .3 Or equivalent
- .2 Fibrous insulation adhesive:
 - .1 10 Flame Spread and 0 Smoke Developed ratings.
 - .2 Volatile Organic Content: maximum 250 g/L
 - .3 Acceptable manufacturers:
 - .1 Childers CHIL-STIX FRN CP-82
 - .2 Foster No. 85-70
 - .3 Or equivalent
- .3 Adhesive for flexible closed cell foam insulation:
 - .1 Quick-setting adhesive for seams and joints of flexible unicellular insulation.
 - .2 5 Flame Spread and 0 Smoke Developed rating
 - .3 Volatile Organic Content: maximum 80 g/L.
 - .4 Acceptable manufacturers:
 - .1 Armaflex 520 BLV
 - .2 Armaflex Low VOC Spray Contact Adhesive
 - .3 Or equivalent
- .4 Calcium Silicate fasteners:
 - .1 cut and mitred to fit, secured in place with 16 gauge stainless steel with twisted ends on maximum 12" (300mm) centres;
 - .2 all joints shall be painted with high temperature insulating cement.
- .5 Lap seal adhesive:
 - .1 Quick-setting adhesive for joints and lap sealing of vapour barriers.
 - .2 10 Flame Spread and 0 Smoke Developed ratings.
 - .3 Volatile Organic Content: maximum 250 g/L.
 - .4 Acceptable manufacturers:
 - .1 Bakor 220-05
 - .2 Childers CHIL-STIX FRN CP-82
 - .3 Or equivalent
- .6 Vapour barrier tape:
 - .1 Tape: Colour matching, pressure sensitive, self-adhesive vinyl tape.
 - .2 Under 25 for Flame Spread and under 50 for Smoke Developed ratings.
 - .3 UL 181A listed.
 - .4 Acceptable manufacturers:
 - .1 Johns Manville - Zeston Z-Tape

- .2 MacTac Canada Limited - Vinyl Scrim or Foil Scrim Kraft
 - .3 Compac Corp.
 - .4 Fattal Canvas Inc. – Insultape
 - .5 Or equivalent
- .7 Weld Pins, Studs and Clips:
 - .1 Acceptable manufacturers:
 - .1 Midwest Fasteners
 - .2 Continental Studwelding
 - .3 Or equivalent
- .8 Staples:
 - .1 Monel, flare type, minimum size ½" (12mm).
- .9 Tie Wire:
 - .1 16 ga (1.6mm) stainless steel with twisted ends.
- .10 Caulking for metal finish jacketing (outdoor use only)
 - .1 fast-drying, aluminum colour finish, flexible butyl elastomer based vapour barrier sealant.
 - .2 Acceptable manufacturers:
 - .1 Foster 95-44
 - .2 Or equivalent

2.12 COATINGS AND MEMBRANES

- .1 Reinforcing Membrane:
 - .1 synthetic fibre:
 - .1 Leno weave,
 - .2 indoor and outdoor use.
 - .3 Acceptable manufacturers:
 - .1 Foster Mast-A-Fab
 - .2 Or equivalent
 - .2 glass-fibre fabric:
 - .1 indoor use.
 - .2 Acceptable manufacturers:
 - .1 Childers Chil-Glas #5/#10
 - .2 Or equivalent
 - .3 glass-fibre fabric for use with elastomeric closed cell foam insulation:
 - .1 indoor use.
 - .2 Acceptable manufacturers:
 - .1 Childers Chil-Glass #10
 - .2 Or equivalent
- .2 Breather Coating - Indoors:
 - .1 Non-combustible, less than 25/50 fire/smoke rating.
 - .2 for breather coatings and lagging adhesive,
 - .3 Volatile Organic Content: maximum 50 g/L

- .4 white in colour,
- .5 Acceptable manufacturers:
 - .1 Childers CP-50A HV2
 - .2 Foster 30-36
 - .3 Or equivalent
- .3 Breather Mastic - Outdoors:
 - .1 for breather coatings and lagging adhesive,
 - .2 abrasion resistive, flexible,
 - .3 UV stabile,
 - .4 grey in colour.
 - .5 Acceptable manufacturers:
 - .1 Childers Vi-Cryl CP-10/11
 - .2 Foster 35-00 / 45-00
 - .3 Bakor 120-10
 - .4 Or equivalent
- .4 Vapor Barrier Coatings - Indoors:
 - .1 Non-combustible, less than 25/50 fire/smoke rating.
 - .2 Volatile Organic Content: maximum 50 g/L.
 - .3 for vapor barrier coatings and lagging adhesive except for elastomeric closed cell foam,
 - .1 permeance rating 0.02 perms maximum,
 - .2 white in colour
 - .3 Acceptable manufacturers:
 - .1 Childers Chil Perm CP-34/35
 - .2 Foster 30-80, 30-90
 - .3 Or equivalent
 - .4 for use with elastomeric closed cell foam.
 - .1 Acceptable manufacturers:
 - .1 Childers CHIL-SPRAY WB CP-56 Adhesive
 - .2 Or equivalent
- .5 Vapor Barrier Mastic - Outdoors:
 - .1 for vapor barrier coatings and lagging adhesive,
 - .2 asphalt cutback,
 - .3 permeance rating 0.02 perms maximum,
 - .4 Grey in colour.
 - .5 For outdoor use only; not rated to meet fire/smoke rating of 25/50.
 - .6 Acceptable manufacturers:
 - .1 Childers Chil-Pruf CP-22
 - .2 Foster 60-25/60-26
 - .3 Or equivalent

2.13 INSULATION CEMENT

- .1 Hydraulic-setting finishing type.

2.14 FIELD APPLIED FINISHES AND JACKETING

- .1 PVC (Polyvinyl Chloride) finish jacket:
 - .1 Apply in exposed areas on piping with operating temperatures less than 180°F. (80°C.).
 - .2 Ultraviolet resistant.
 - .3 Piping: ULC listed PVC moulded type jacketing material, gloss white complying with 25 Flame Spread and 50 Smoke Developed ratings.
 - .4 minimum 20 mil thickness with permeability not more than 0.09 perms,
 - .5 Fittings: ULC listed PVC, gloss white, 1-piece, pre-molded fittings complying with 25 Flame Spread and 50 Smoke Developed ratings.
 - .6 Glass-fibre insulation inserts for elbows, tees, valves, end-caps, mechanical pipe couplings,
 - .7 Fastenings: self-sealing longitudinal joints in accordance with manufacturer's standard(s).
 - .8 Pressure sensitive, colour matching vinyl tape.
 - .9 Acceptable manufacturers:
 - .1 Johns Manville - Manville Zeston 2000
 - .2 ACWIL Insulations
 - .3 Sure Fit Systems
 - .4 Proto PVC – LoSMOKE
 - .5 Or equivalent
 - .10 3M Venture Clad model 1579CW-WME, or equivalent, is acceptable for use in lieu of PVC finish jacket.
- .2 Fabric Finish Jacket:
 - .1 Apply in exposed areas: compacted firm, ULC listed, heavy plain weave, cotton fabric at 6 oz. per sq. yd (220g/sq.m) treated with diluted fire retardant lagging adhesive, or;
 - .2 Re-wetable fiberglass lagging fabric with water activated self-adhesive.
 - .3 On concealed valves and fittings, use ULC listed plain weave cotton fabric at 3 oz. per sq. yd (120 g/sq.m).
 - .4 Suitable for field painting.
 - .5 Acceptable manufacturers:
 - .1 Fattal's Thermocanvas
 - .2 Johns Manville
 - .3 Alpha-Maritex 3451-RW
 - .4 Clairmont Diplag 60
 - .5 Glass-Cell FR
 - .6 Newtex - Zetex Rewettable
 - .7 Or equivalent
 - .6 3M Venture Clad model 1579CW-WME, or equivalent, is acceptable for use in lieu of fabric finish jacket.
- .3 Metal Finish Jacket:
 - .1 Apply in areas exposed to the outdoors to CSA HA Series-M1980:
 - .2 straight pipe:

- .1 Crimped or embossed alloy jacketing 0.016" (0.045 mm) 26 gauge thick with longitudinal slip joints and 2" (50mm) end laps with factory attached protective liner on interior surface or,
- .2 Corrugated stainless steel not less than 0.25 mm (0.010 in) thick sheet.
- .3 fittings:
 - .1 Minimum 0.016" (0.045mm) thick, custom made swaged ring or lobster back covers on bends and die shaped fitting covers over fitting, valves, strainers, flanges, and grooved couplings with factory attached protective liner on interior surface.
- .4 bands:
 - .1 12 mm (½ in) wide stainless steel with mechanical fasteners.
 - .2 Acceptable manufacturers:
 - .1 Alcan Canada Products - Thermo-clad Type 1
 - .2 Childers Products Inc. - Fab Straps
 - .3 Or equivalent
- .5 Band all transverse seams with waterproof mastic tape and caulk all longitudinal seams with silicone caulking. Seal the entire covering to achieve a watertight assembly.
- .4 Self-adhesive Weather Barrier Membrane (SAWB):
 - .1 self-adhering membrane of acrylic adhesive with siliconized release paper, not exceeding flame/smoke generation rating of 25/50, for indoor and outdoor use,
 - .2 self-adhering membrane of rubberized asphalt compound with siliconized release paper, for outdoor use only
 - .3 laminated to stucco-embossed aluminum foil,
 - .4 Self-sealing with penetration of self-tapping screws.
 - .5 Water vapour permeance 0.05 perms.
 - .6 Acceptable manufacturers:
 - .1 3M Venture Clad 1579CW - indoor and outdoor applications
 - .2 Bakor - Foilskin - outdoor applications
 - .3 Polyguard Products Alumaguard 60 - outdoor applications
 - .4 Or equivalent
- .5 Protective finish for elastomeric cellular foam insulation
 - .1 indoors and outdoors:
 - .2 Acceptable manufacturers:
 - .1 Armaflex WB Finish
 - .2 Or equivalent

PART 3 - EXECUTION

3.01 GENERAL DESIGN AND PERFORMANCE REQUIREMENTS

- .1 Insulation Thickness: All plumbing piping to be insulated, including insulation for condensate drain piping from equipment drain pans, and refrigerant piping, shall be minimum 25 mm thick unless noted otherwise.
- .2 Performance Requirements: As a minimum, insulation application methods and standards shall be as per the NATIONAL INSULATION STANDARDS of the Thermal Insulation Association of Canada.

- .3 General Insulation Application Requirements: General requirements pertaining to the application of mechanical insulation are specified herein. Unless otherwise specified, do not insulate the following:
 - .1 factory insulated equipment /plenums/ panels and piping;
 - .2 heated liquid system pump casings, valves, strainers and similar accessories;
- .4 Flanges and Mechanical Couplings: Terminate sectional insulation approximately 2" (50mm) from the flange or coupling on each side of the flange or coupling. Cover the flange or coupling with a minimum 2" (50mm) thickness of blanket mineral fibre insulation wide enough to butt tightly to the ends of the adjacent sectional insulation. Secure the blanket insulation in place and cover with a PVC cover.
- .5 For cold and dual temperature surfaces with the possibility of condensation, install insulation directly over pipes and not over hangers and supports.
- .6 For warm surfaces, line size hangers shall be permitted and insulation shall cover the hanger to maintain the specified thickness in accordance with ASHRAE 90.1.
- .7 Pipe Insulation Sizing:
 - .1 Provide minimum insulation thickness for services in accordance with Insulation Thickness Tables specified.

3.02 PIPING INSULATION APPLICATION

- .1 Apply insulation materials, accessories and finishes in accordance with manufacturer's recommendations.
- .2 Apply insulation once required tests are complete and approved by the Consultant and heat tracing is installed.
- .3 Surfaces shall be clean and dry when insulation is applied and during application of any finish.
- .4 Store and use adhesives, mastics, and insulation cements at ambient temperatures and conditions recommended by product manufacturers.
- .5 Apply insulation under ambient temperature conditions in accordance with insulation or adhesive manufacturer's recommendations.
- .6 Apply insulation neatly and tightly in unbroken lengths and with ends of sections firmly and squarely butted or engaged together. Lap canvas or other specified wrapping over all joints and thoroughly cement down with adhesive. Vapour barriers and insulation shall be complete over the full length of pipe or surface, without penetration for hangers, and without interruption at sleeves, pipe and fittings.
- .7 Do not apply insulation on chrome-plated surfaces of piping, valves, fittings, and equipment.
- .8 Cut and bevel insulation around nameplates and pressure vessel stamps.
- .9 Neatly finish insulation at supports, protrusions, and interruptions.
- .10 Extend insulation through sleeves in walls (except firewalls) or other openings in the building for a continual insulation and vapour barrier of uniform diameter.
- .11 Terminate insulation at each side of the firewalls and pack the space between the wall sleeve and pipe.
- .12 Replace removed insulation from existing piping to make tie-in connections with new insulation. Cut back existing insulation a sufficient distance to make/form a neat and firm butt joint between old and new insulation.
- .13 Protect insulation on cold and dual temperature services with insulation shields consisting of high-density insulation and sheet steel support.
- .14 Apply specified adhesives, mastics and coatings to manufacturer's recommended minimum coverage per gallon.
- .15 Install insulation with smooth and even surfaces.

- .16 Where piping is indicated to be heat traced, provide oversized insulation to accommodate heat-tracing cable.
- .17 Seal exposed insulation with reinforced vapor barrier or breather coating or mastic.
- .18 Finish piping with field installed finish jackets as specified herein.
- .19 Pipe Insulation:
 - .1 Preformed Insulation: Sectional insulation up to NPS 12" (300mm), sectional or curved segmented above NPS 12" (300mm).
 - .2 Multi-Layered Insulation: Use staggered butt joint construction.
 - .3 Vertical Pipe over NPS 3" (75mm): Use insulation supports welded or bolted to pipe directly above lowest pipe fitting. Thereafter, locate on 15' (4.5 m) centres and at each valve and flange.
 - .4 At expansion joints in piping, apply insulation over a 16 gauge sleeve fabricated to fit around expansion joint without restricting its movement. Fabricate sleeve(s) so it may be removed to allow for the repacking and lubrication of the expansion joint without damaging adjoining insulation. Extend sleeves a minimum of 3" (75mm) longer than the expansion joint, fit with insulation retaining flanges and with a means of maintaining the position of the sleeve over the expansion joint.
 - .5 Terminate insulation at each end of unions and flanges on hot lines, and at other points where indicated, with insulation cement, to CGSB 51-GP-6M, trowelled on bevel.
 - .6 Gouge out insulation for a proper fit where there is interference between the weld bead and the insulation. Bevel away from studs and nuts to permit their removal without damage to insulation, and closely and neatly trim around extending parts of pipe saddles, supports, hangers, and clamp guides and seal with insulating cement.
 - .7 Insulate flanges, valves and fittings with segments of insulation of the same type and thickness as the insulation on the pipe, secured in place with soft annealed galvanized wire. Finish with cement and canvas while the cement is still wet.
 - .8 Provide fire retardant coating on all field applied finishes and jacketing.
 - .9 Priming:
 - .1 Coat canvas covering exposed insulation in finished spaces with diluted coat of lagging adhesive, as recommended by the insulation manufacturer.

3.03 HOT PIPING SYSTEMS INSULATION

- .1 Insulate hot piping systems including pipe, valves, fittings, and pipeline accessories in accordance with Insulation Thickness Tables.
- .2 Insulate Condensate piping to the same criteria as its associated steam system.
- .3 Insulate Safety Relief valve piping located between floor or elevated work surface, up to 8 ft. (2.4m) above same, that passes within 4 ft. (1.2m) of a floor or elevated work surface.

3.04 COLD AND DUAL TEMPERATURE PIPING SYSTEMS INSULATION

- .1 Insulate cold and dual temperature piping systems including pipe, valves, fittings, and pipeline accessories in accordance with Insulation Thickness Tables.
- .2 For drainage systems insulate:
 - .1 storm water roof drain body,
 - .2 storm water piping from roof drain body to the floor level of the story below the drain body,
 - .3 sanitary piping in the following locations,
 - .1 horizontal sanitary drainage piping NPS 3" (75mm) and larger in ceiling spaces,
 - .2 exposed sanitary drainage piping in wet areas including sterile processing, dishwashing, cart-washing

- .3 exposed sanitary drainage piping in IT/Data rooms,
- .4 exposed sanitary drainage piping in service tunnels
- .5 exposed sanitary drainage piping serving spaces located above a parking garage open to the outdoors.
- .3 For greater clarity, domestic hot water, domestic hot water recirculation, non-potable hot water, and non-potable hot water recirculation piping systems are treated as “cold and dual temperature” for the purpose of application of vapour barriers to both hot and cold domestic and non-potable water piping.

3.05 PIPING

- .1 Insulate straight pipe sections by staggering adjacent longitudinal seams 1/4 turn each butt joint.
- .2 Secure insulation at centre of each section, at each end, and at not more than 24” (600mm) intervals with:
 - .1 vapor barrier tape in addition to jackets with self-adhering lap joints for type P1 (molded glass fibre, hot temperature), P2 (molded glass fibre, cold and dual temperature) and P3 (glass fibre semi-rigid board) insulation on **Cold and Dual Temperature piping**,
 - .2 mechanical fastened (stapled) or jackets with self adhering lap joints on type P1 (molded glass fibre, hot temperature), P2 (molded glass fibre, cold and dual temperature) and P3 (glass fibre semi-rigid board) insulation on **Hot piping**,
 - .3 bands or wire for type P6 (molded phenolic), P7 (calcium silicate), P8 (molded mineral wool fibre), P9 (molded mineral wool fibre high temperature) and P11 (cellular glass) insulation,
 - .4 self-adhered or provide 100% coverage of contact adhesive for type P5 (flexible elastomeric closed cell) insulation,
 - .5 in accordance with listing requirements for type P10 (fire rated) insulation.

3.06 FITTINGS, FLANGES, COUPLINGS, AND STRAINERS

- .1 Insulate fittings including elbows and tees:
 - .1 NPS 1½” (40mm) and smaller:
 - .1 mitre cut insulation to create tight fit,
 - .2 for PVC cover, trim backside of insulation on elbows to suit cover but do not reduce total thickness less than that of adjacent pipe insulation.
 - .2 NPS 2” (50mm) and larger:
 - .1 use matching preformed insulation inserts, or fabricate mitred insulation segments made from same material as pipe insulation,
 - .2 number of mitred segments to be sufficient to maintain thickness of insulation around throat of elbow,
 - .3 secure inserts and fabricated segments with wire prior to application of coatings or finishes.
- .2 Insulate flanges and grooved joint couplings:
 - .1 Insulate with preformed inserts or build-up insulation with same material as on adjacent pipe:
 - .1 butt pipe insulation to each side of flange, coupling, valve, or strainer,
 - .2 build up rigid insulation blocking on each side of fitting, coupling, valve or strainer, with a width dimension same as pipe insulation thickness, and
 - .3 apply insulation layer over outside of flange, coupling, valve or strainer to a thickness equal to pipe insulation thickness.
 - .4 provide removable insulation section on strainer head.

- .2 Where phenolic insulation is used;
 - .1 same as above except use factory made insulation inserts, or fabricate inserts to suit fixture.
- .3 Where elastomeric insulation is used;
 - .1 same as above except adhere insulation to flange, coupling, or strainer with full coverage of adhesive,
 - .2 do not adhere insulation across bolted connections - insulate on each side of connection and add additional insulation layer across connection and fix in place with bands.

3.07 PIPELINE ACCESSORIES

- .1 Insulate pipeline accessories:
 - .1 valves
 - .2 strainers
 - .3 pressure reducing valves
 - .4 safety valves
 - .5 meters
 - .6 steam separators
- .2 Insulate accessories for Hot Temperature piping systems with design temperatures greater than 200°F (93°C):
 - .1 where located within 7 ft. (2.1m) above a floor or work surface
 - .2 with type P12 removable/ reuseable high temperature insulated fitted jackets,
 - .3 allow free movement of valve actuator.
- .3 No insulation is required on pipeline accessories for Hot Temperature piping systems with design temperatures of 200°F (93°C) or less.
- .4 Insulate accessories for Cold and Dual Temperature piping systems for chilled water and liquid refrigerant piping:
 - .1 detachable insulated box type with embossed aluminum or stainless steel jacket, with vapour barrier tape applied to seams when installed,
 - .1 lined with two layers of 25 mm (1 in) P5 (flexible elastomeric closed cell) blanket or one layer of 25 mm (1 in) thick P6 (molded phenolic) insulation, with no voids at corners or joints,
 - .2 at locations requiring access, extend insulation to create collar around bolted connection, and install a compression fit piece of insulation to cover equipment.
- .5 Insulate accessories for all other Cold and Dual Temperature piping systems:
 - .1 insulate with flexible blanket of same material and thickness of adjacent piping and seal with reinforced vapour barrier sealer.
 - .2 at locations requiring access including valve handles, valve actuators, drain valves, and other similar serviceable equipment, cut-back insulation and seal exposed edges.

3.08 DRAINAGE SYSTEMS - ADDITIONAL REQUIREMENTS

- .1 Insulate underside of roof drain hoppers with flexible blanket insulation of same type as pipe insulation.

3.09 HANGERS AND SUPPORTS

- .1 Provide insulation protection in accordance with Insulation Hanger Protection Table of this Section, based on pipe size and service process temperature.

- .2 Pipe saddle insulation protection:
 - .1 insulate the interior void spaces of pipe saddles, of same material as adjacent pipe insulation,
 - .2 butt insulation up to sides and end of pipe saddle, and leave bottom surface of saddle exposed for direct contact with pipe support.
- .3 Pipe shield insulation protection:
 - .1 install insulation shield between outside of insulation and pipe support; pipe support is sized for outside dimension of insulation.
 - .2 in accordance with pipe size, provide high density insulation insert of same thickness as adjacent pipeline material, fabricated from:
 - .1 cold and dual temperature piping: type P6 (molded phenolic),
 - .2 hot temperature piping: type P6 (molded phenolic),
 - .3 10" (250mm) long for pipe size up to NPS 1-1/2" to 2-1/2" (40mm to 65mm);
 - .4 12" (300mm) long for pipe size up to NPS 3" to 6" (75mm to 150mm);
 - .5 16" (400mm) long for pipe size up to NPS 8" to 10" (200mm to 250mm);
 - .6 22" (550mm) long for pipe sizes NPS 12" (300mm) and larger.

Insulation Hanger Protection Table				
Process Temperature	Pipe Size NPS	Pipe Saddle	Insulation Shield	High-Density Insert
> 200°F (> 93°C)	≤ 1 ¼"	---	•	---
	≥ 1 ½"	•	---	---
141°F to 200°F (61°C to 93°C)	≤ 1 ¼"	---	•	---
	≥ 1 ½" & ≤ 6"	---	•	•
	> 6"	•	---	---
80°F to 140°F (26°C to 60°C)	≤ 1 ¼"	---	•	---
	≥ 1 ½"	---	•	•
Cold & Dual Temp	≤ 1 ¼"	---	•	---
	≥ 1 ½"	---	•	•

3.10 INSULATION AT PIPE ANCHORS

- .1 Insulate pipe anchor plates and frames with flexible elastomeric closed cell foam blanket of type P5 (flexible elastomeric closed cell) insulation and seal with vapour barrier coating.
- .2 Extend insulation along anchor steel a minimum distance of 6" (150mm) outside the piping insulation thickness.

3.11 FLOOR AND WALL SLEEVES

- .1 Extend pipe insulation including coatings and finishes through floor and wall sleeves.
- .2 For penetrations through fire rated separations, provide finishes in accordance with fire stopping manufacturer's listing requirements.
- .3 For outdoor piping passing through exterior walls or roof, terminate mastic lagging at outside face of sleeve and protected by storm flashing, caulked to lagging and to building structure.

3.12 SEALING INSULATION

- .1 Apply coatings and mastic in accordance with manufacturer requirements.
 - .1 Hot Temperature piping: breather coating/mastic
 - .2 Cold and Dual Temperature piping: vapor barrier coating/mastic
- .2 Only use mastics on outdoor installations.
- .3 Apply mastics and coatings when ambient temperature is above 40°F (4°C) unless manufacturer's instructions permit colder ambient installation conditions.
- .4 Hot Temperature piping;
 - .1 seal lap joints with self-adhesive lap joint, reinforced breather coat, or vapour barrier tape,
 - .2 seal butt joints with matching vapour barrier tape.
- .5 Cold and Dual Temperature Piping;
 - .1 tightly seal insulation with factory applied all-purpose jacket using self-adhering or field applied adhesive on longitudinal laps and butt joint.
 - .2 where sealing strips are damaged, apply secondary layer of colour matched vapor barrier tape.
 - .3 seal insulation without factory applied jackets with 100% coverage of vapor barrier coating/mastic as applicable complete with reinforcing membrane.
 - .4 seal insulation butt ends with vapor barrier coating every four (4) lengths of insulation but not to exceed 8ft. (2.4m) of pipe length.
- .6 Hanger high-density insulation inserts:
 - .1 seal inserts with reinforced breather or vapour barrier coating as applicable, overlapping adjacent insulation a minimum of 2" (50mm).
- .7 Elbows, tees, flanges, and fittings;
 - .1 Apply applicable breather or vapor barrier coating/mastic with reinforcing membrane over fitting insulation and overlap 2" (50mm) onto adjacent pipe insulation.
 - .2 For greater clarity, use of vapor barrier tape to seal insulation is not permitted.
- .8 Apply coating/mastic and reinforcing membrane regardless of final finish application.
- .9 Maintain integrity of vapor barrier through sleeves, around fittings and at hangers and supports.

3.13 INSULATION FINISH COVERINGS

- .1 Install protective finish coverings on insulation in accordance with Piping Insulation Protective Finishes Table of this Section, after breather and vapor barrier sealing is completed.
- .2 Cut finish jacket materials used for covering to allow 2" to 4" (50mm to 100mm) longitudinal overlap and similar circumferential overlap onto adjacent sheets.
- .3 On vertical pipes arrange circumferential overlap on adjacent sheets outside of sheet below and under sheet above.
- .4 PVC sheeting:
 - .1 Hot Temperature piping:
 - .1 overlap longitudinal edges and adjacent sheets by minimum of 2" (50mm) and staple fasten the sheets.
 - .2 secure sheeting with colour matched tape around circumference, at least two places per section of sheet, and by stapling longitudinal and circumferential edges.
 - .3 do not seal edges with vapour barrier tape.

- .4 seal PVC fitting covers at throat and heel seams by stapling and secure over insulation by banding or taping ends to adjacent pipe finish covering with colour matched tape.
- .2 Cold and Dual Temperature piping:
 - .1 overlap longitudinal edges and adjacent sheets by minimum of 2" (50mm) and seal longitudinal edges with vapor barrier coating adhesive for full depth and 100% coverage of overlap,
 - .2 seal circumferential edges of PVC fitting covers with reinforced vapour barrier coating adhesive extending over adjacent pipe insulation section with an overlap of at least 2" (50mm).
 - .3 seal PVC fitting covers at throat and heel seams by solvent bonding and secured over insulation with reinforced vapor barrier coating/mastic overlapping adjacent pipe insulation a minimum of 2" (50 mm).
- .5 Metal:
 - .1 Use lock-on systems or secure sheeting with bands 18" (450mm) apart.
 - .2 Joint sealing:
 - .1 Hot pipe: do not seal joints.
 - .2 Cold and dual temperature pipe: seal joints with caulking.
 - .3 Curved surfaces: custom made swaged ring or lobster back covers.
 - .4 On outdoor hot and cold/dual temperature piping, caulk overlapping metal joints to permit expansion of metal jacket.
- .6 Canvas Fabric:
 - .1 Canvas lagging:
 - .1 apply canvas lagging with minimum two coatings of breather or vapor barrier coating adhesive as applicable to the piping system, and finish to provide a smooth surface free of wrinkles and sags.
 - .2 where cotton lagging with appropriate coating is used this satisfies the requirements of a sealer coating for Hot or Cold/Dual temperature piping systems.
 - .2 Fiberglass lagging:
 - .1 apply re-wettable fiberglass lagging in accordance with manufacturer instructions. Finish to provide a smooth surface free of wrinkles and sags.
 - .2 where re-wettable fiberglass lagging is used this satisfies the requirements of a sealer coating for Hot piping systems.

Piping Insulation Protective Finishes				
Location	Weather Exposure	System/Space	Finish	Insulation Type
Concealed	Indoors	All	Fabric	P1, P2, P3, P4, P6, P7, P8, P9, P11
Exposed	Indoors	Service Rooms	Fabric or PVC	P1, P2, P3, P4, P6, P7, P8, P9, P11
	Indoors	Public Spaces	PVC	P1, P2, P3, P4, P6, P7, P8, P9, P11
	Outdoors	All	Metal	P1, P2, P3, P4, P6, P7, P8, P9, P11
	Outdoors	All	SAWB	P1, P2, P3, P4, P6, P7, P8, P9, P11

3.14 PAINTED PIPING

- .1 Not applicable.

3.15 MECHANICAL DAMAGE PROTECTION

- .1 For indoor installations, protect exposed pipe insulation extending up through a floor sleeve at floor line with 18 ga. (1.2mm) stainless steel jacket approximately 4" (100mm) high, secured to floor slab. Conceal fastenings by floor plate.
- .2 For piping systems using metal finishes, this protection cover replaces a portion of the specified pipe cover.
- .3 For piping systems using other finishes, this protection cover is in addition to the specified pipe cover.

3.16 FIELD INSPECTION QUALITY CONTROL

- .1 The Consultant reserves the right to have protective finish coverings removed on up to 5% of all fittings, flanges, couplings, valves, and pipeline accessories to review the sealing of the insulation.
- .2 Upon inspection, if insulation sealing is found to be incorrect at any one, the Consultant, in their sole discretion, may call for the removal of the protective finish on all fittings, flanges, couplings, valves, and pipeline accessories for further review.
- .3 Repair defective sealing and replace protective coverings at no additional cost.

PART 1 - GENERAL

1.01 GENERAL REQUIREMENTS

- .1 Comply with requirements of the Division 01 General Requirements and all documents referred to therein.

1.02 SCOPE OF WORK

- .1 The Contractor shall provide all services, materials and labour required to fully Commission the Mechanical Systems as specified herein.
- .2 The Contractor shall provide all services, materials and labour required to successfully complete Functional Performance Testing of the Mechanical Systems as part of Commissioning the overall building systems as a holistic operation.
- .3 Integrated Systems Testing of Fire Protection and Life Safety Systems shall be completed in accordance with CAN/ULC-S1001-11.
- .4 Equipment Suppliers, Vendors and other Sub-Trades are expected to support the Contractor complete Mechanical Commissioning Specified in this Section. Support may come in the form of attendance on site to verify correct installation, performance, trouble shooting, training and final documentation at turn-over. The Contractor shall ensure Equipment Suppliers and Vendors provide the support necessary for successful Mechanical Commissioning.
- .5 ***Perform IAQ Testing or Flush Out as described in this Section of the Specifications.***

1.03 COORDINATION

- .1 Appoint a single person as Commissioning Coordinator who shall be responsible for advancing the commissioning activities of the Mechanical Division.

1.04 QUALITY ASSURANCE

- .1 The following Standards shall be used to guide the commissioning process:
 - .1 ASHRAE Guideline 0 (2019) "The Commissioning Process"
 - .2 ASHRAE Standard 1-1996 Guideline for Commissioning of HVAC Systems.
 - .3 CAN/ULC-S1001 (2011) "Integrated Systems Testing of Fire Protection and Life Safety Systems"
 - .4 NFPA 4 (2021) "Standard for Integrated Fire Protection and Life Safety System Testing"
- .2 Hold and attend regular meetings during the commissioning process. Prepare detailed progress reports to coincide with regular commissioning meetings.
- .3 In addition to all tests listed under this section, the Mechanical Division shall complete its own tests and any additional tests required by the Owner's Commissioning Authority to ensure that all facility, in its entirety, operates as intended.

PART 2 - PRODUCTS

2.01 TEST EQUIPMENT

- .1 All standard testing equipment required to perform startup and initial checkout and required functional performance testing shall be provided by Division contractor for equipment being tested. For example, Mechanical Trades shall ultimately be responsible for all standard testing equipment for HVAC system and controls system provided as part of the Mechanical Work, except for equipment specific to and used by TAB Trades in their Commissioning responsibilities.
- .2 Special equipment, tools and instruments (only available from vendor, specific to a piece of equipment) required for testing equipment, according to these Contract Documents shall be included in base bid price to Contractor and left on site, except for stand-alone data-logging equipment that may be used by Commissioning Authority.
- .3 All testing equipment shall be of sufficient quality and accuracy to test and/or measure system performance with tolerances specified in Specifications. If not otherwise noted, following minimum requirements apply:

- .1 Temperature sensors and digital thermometers shall have a certified calibration within past year to an accuracy of 0.5°F and a resolution of + or - 0.1°F.
- .2 Pressure sensors shall have an accuracy of + or - 2.0% of value range being measured (not full range of meter) and have been calibrated within twelve (12) months of scheduled commissioning testing.
- .3 All equipment shall be calibrated according to manufacturer's recommended intervals and when dropped or damaged. Calibration tags shall be affixed or certificates readily available.

PART 3 - EXECUTION

3.01 DESIGN AND PERFORMANCE REQUIREMENTS

- .1 Provide a schedule with regular updates for the completion of Mechanical Division equipment and systems.
- .2 Six (6) weeks prior to the target Substantial Performance date, submit a detailed and comprehensive installation completion/ start-up/ testing schedule. Update the schedule and resubmit for review, on a bi-weekly basis, during the course of Commissioning. Provide regular revisions and updates to the schedule to suit the updated construction schedule. This schedule shall include, but is not limited to, the following items:
 - .1 Installation and testing of piping systems
 - .2 Chemical clean out and treatment of pipe systems, including disinfection of domestic water piping;
 - .3 Duct cleaning;
 - .4 Control system wiring;
 - .5 Air and hydronic system balancing;
 - .6 Electrical service connections;
 - .7 Equipment suppliers prestart inspection, testing and results of the mechanical equipment installations, including controls;
 - .8 Start-up of various pieces of mechanical equipment and systems;
 - .9 Operational testing and results of mechanical system components;
 - .10 Performance testing and results of mechanical equipment and systems;
 - .11 Acceptance testing of mechanical equipment installations and systems including fire and sprinkler systems, by Authorities Having Jurisdiction ("AHJs") and the Owner's insurance company;
 - .12 Troubleshooting: determination and reiteration of performance issues documenting cause, effect, revisions, and re-test results.
 - .13 Calibration of controls and point-to-point testing results;
 - .14 Control software setup inspection, testing and results including seasonal and response of operating sequences, including Proportional Integral Derivative ("PID") loop optimization
 - .15 Emergency system inspection, testing and results;
 - .16 Fire alarm and control system interfacing results;
 - .17 Submittal of completed mechanical equipment and systems test record sheets;
 - .18 Demonstration of mechanical systems and equipment;
 - .19 Operating and Maintenance ("O&M") manual preparation and submittal;
 - .20 Operator training program
 - .21 Record documentation submittal

3.02 RECORD DOCUMENTATION

- .1 Prepare record documentation for each equipment installation covering:
 - .1 Equipment identification and supplier
 - .2 Shop Drawing submittal, review, production release, and delivery dates
 - .3 Dates for completion of all work required to prepare for equipment installation
 - .4 Dates for equipment installation, supplier prestart checkout and system availability for start-up
 - .5 Dates for equipment start-up, performance testing, proposal for temporary use, acceptance testing, demonstration, turnover and warranty start/finish
 - .6 List all specialist personnel and equipment required for the test and ensure that these are available by the test date.
 - .7 Provide documentation of the commissioning process for inclusion into the maintenance manuals. These are to include checkout sheets, equipment data sheets, start-up certificates from suppliers involved in start-up, documentation concerning demonstration to the Owner. Include all records and result sheets from commissioning tests.
 - .8 Maintain a log of key operating parameters, problems encountered, solutions employed and verification of effectiveness of solutions. Include log in maintenance manuals.

3.03 START-UP

- .1 Coordinate and supervise the start-up of the various pieces of equipment and systems. Utilize the start-up services of the manufacturer's representative. Ensure that the equipment is operating in a satisfactory manner. Check the following items:
 - .1 Direction of rotation
 - .2 Grease and lubricants
 - .3 Noise, if deemed to be a problem
 - .4 Seals
 - .5 Alignment of base mounted pumps, fan drives and turbine drives by a Millwright
 - .6 Piping connections and safeties
 - .7 Electrical amp draw, starting inrush current and trip/heater settings
- .2 Prior to the equipment start-up, arrange to have the Manufacturer of all major equipment inspect the installation to ensure their equipment has been installed in accordance with their recommendations.
- .3 Functional testing is intended to begin upon successful completion of start-up. Functional testing may proceed prior to the completion of systems or sub-systems at the discretion of the Owner and the Owner's Commissioning Consultant. Beginning system functional testing prior to full completion does not relieve the Mechanical Division from fully completing the system, including all start-up checklists.

3.04 TROUBLESHOOTING

- .1 Resolve inter-Division coordination problems.
- .2 Where problems become apparent during the commissioning process, identify and resolve these problems. The basic functions of troubleshooting include:
 - .1 Identify and define the problems
 - .2 Determine and evaluate the causes
 - .3 Determine the time available to resolve the problem
 - .4 Involve the designing authority in the review of the problem and proposed resolution
 - .5 Coordinate remedial action with the appropriate parties
 - .6 Evaluate the effectiveness of the remedial action

- .7 Record the problem, cause, remedial action and result

3.05 OPERATIONAL TESTING

- .1 Test the operation of the individual components and systems. Go through each step of the sequence of operation and verify that each component operates correctly. Direct and ensure that all trades involved make the required changes and adjustments to effect the proper operation of all components and systems. Meet commissioning test requirements.
- .2 Document the operation and testing.
- .3 Ensure operational tests are completed for heating, cooling and intermediate seasons.
- .4 For any systems and assemblies where some testing has been deferred, coordinate seasonal commissioning for those systems that have been functionally tested and handed over in seasons where retesting and commissioning will be required during the opposite season.

3.06 DEMONSTRATION AND TRAINING

- .1 Demonstrate to the operating staff the proper operation of all mechanical equipment and systems. Demonstrations shall occur only after the operation and testing has been successfully completed. Ensure that all affected Mechanical Division Trade Contractor(s) and equipment suppliers participate in the demonstrations as required.
- .2 Thoroughly instruct the operating staff in the safe and efficient operation and maintenance of all systems and equipment.
- .3 Provide designated operating personnel with comprehensive orientation and training in the understanding of the systems and the operation and maintenance of each piece of mechanical equipment including, but not limited to, pumps, boilers, chillers, heat rejection equipment, air conditioning units, air handling units, fans, terminal units, controls and water treatment systems, fuel systems and other mechanical systems.
- .4 Training shall normally start with classroom sessions followed by hands-on training on each piece of equipment, which shall illustrate the various modes of operation, including start-up, shutdown, fire/smoke alarm, power failure, and other similar modes of operation.
- .5 During any demonstration, should the system fail to perform in accordance with the requirements of the O&M manual or sequence of operations, the system will be repaired or adjusted as necessary and the demonstration repeated.
- .6 The appropriate trade or manufacturer's representative shall provide the instructions on each major piece of equipment. This person may be the start-up technician for the piece of equipment, the installing contractor or manufacturer's representative.
- .7 Practical building operating expertise as well as in-depth knowledge of all modes of operation of the specific piece of equipment is required. More than one party may be required to execute the training.
- .8 The controls contractor shall attend sessions other than the controls training, as requested, to discuss the interaction of the controls system as it relates to the equipment being discussed.
- .9 The training sessions shall follow the outline in the Table of Contents of the operation and maintenance manual and illustrate whenever possible the use of the O&M manuals for reference.
- .10 Training shall include:
 - .1 Use of the printed installation, operation and maintenance instruction material included in the O&M manuals.
 - .2 A review of the written O&M instructions emphasizing safe and proper operating requirements, preventative maintenance, special tools needed and spare parts inventory suggestions. The training shall include start-up, operation in all modes possible, shutdown, seasonal changeover and any emergency procedures.
 - .3 Discussion of relevant health and safety issues and concerns.
 - .4 Discussion of warranties and guarantees.

- .5 Common troubleshooting problems and solutions.
- .6 Explanatory information included in the O&M manuals and the location of all plans and manuals in the facility.
- .7 Discussion of any peculiarities of equipment installation or operation.
- .8 Classroom sessions shall include the use of overhead projections, slides, video/audio-taped material as might be appropriate.
- .9 Hands-on training shall include start-up, operation in all modes possible, including manual, shut-down and any emergency procedures and preventative maintenance for all pieces of equipment.
- .10 The mechanical contractor shall fully explain and demonstrate the operation, function and overrides of any local packaged controls, not controlled by the central control system.
- .11 During any demonstration or hands-on training, should the system fail to perform in accordance with the requirements of the O&M manual or sequence of operations, the system will be repaired or adjusted as necessary and the demonstration repeated.
- .12 There shall be three controls training sessions:
 - .1 Training I. Control System. This training will be held on-site. Upon completion, each trainee, using appropriate documentation, should be able to perform elementary operations and describe general hardware architecture and functionality of the system.
 - .2 Training II. Building Systems. The second session shall be held on-site and shall include hands-on training after the completion of system commissioning. The session shall include instruction on:
 - .1 Specific hardware configuration of installed systems in this building and specific instruction for operating the installed system, including HVAC systems and any interface with other communication systems.
 - .2 Security levels, alarms, system start-up, shut-down, power outage and restart routines, changing setpoints and alarms and other typical changed parameters, overrides, freeze protection, manual operation of equipment, optional control strategies that can be considered, energy savings strategies and set points that if changed will adversely affect energy consumption, energy accounting, procedures for obtaining vendor assistance, etc.
 - .3 All trending and monitoring features (values, change of state, totalization, etc.), including setting up, executing, downloading, viewing both tabular and graphically and printing trends.
 - .4 Trainees will actually set-up trends in the presence of the trainer.
 - .5 Every screen shall be completely discussed, allowing time for questions.
 - .6 Use of keypad or plug-in laptop computer at the zone level.
 - .7 Use of remote access to the system via phone lines or networks.
 - .8 Setting up and changing an air terminal unit controller.
 - .9 Graphics generation.
 - .10 Point database entry and modifications.
 - .11 Understanding DDC field panel operating programming (when applicable).
 - .12 Trend log set-up and exporting.
 - .3 Training III. The third training shall be conducted on-site six months after occupancy. The session will be structured to address specific topics that trainees need to discuss and to answer questions concerning operation of the system.

3.07 IAQ TESTING OR FLUSH-OUT

- .1 ***Prior to occupancy perform an IAQ testing or flush-out in accordance with the following procedural requirements.***
- .2 ***IAQ testing is the preferred method, however, a flush-out of the construction area may be performed in lieu of IAQ Testing at the discretion of the Owner's Project Manager.***
- .3 ***Any costs associated with IAQ Testing and/or flush-out shall be carried by the Contractor in their bid price.***
- .4 ***IAQ Testing Procedure:***
 - .1 ***IAQ testing protocols shall be consistent with the United States Environmental Protection Agency Compendium of Methods for Determination of Air Pollutants in Indoor Air.***
 - .2 ***Testing shall be completed over the course of one (1) normal operating day (additional days are acceptable if required due to sampling equipment limitations). Testing shall be performed by parties experienced in IAQ testing.***
 - .3 ***All HVAC systems shall be fully operational in their normal operating mode during all testing periods.***
 - .4 ***The number of sampling locations shall be not less than six (6), five (5) indoors and one (1) outdoors, and there shall be a minimum of one sample per 1000 square meters of floor space, and one sample per floor.***
 - .5 ***Sample locations shall be evenly distributed throughout the floor space.***
 - .6 ***A minimum of one outdoor sample is required for each day of indoor testing, preferably from near the building's outdoor air intake if possible.***
 - .7 ***Indoor testing is to be completed between 4 ft. (1200mm) and 7ft. (2100mm) from the floor in an effort to represent the breathing zone of occupants.***
 - .8 ***The following table indicates contaminants to be measured as well as maximum allowable concentrations:***

Contaminant	Maximum Concentration
Formaldehyde	27 parts per billion
Respirable particulate matter (PM10)	50 micrograms per cubic metre
Total volatile organic compounds (VOC's)	500 micrograms per cubic metre
4-Phenycyclohexane (4-PC) [only required if carpets with styrene butadiene backing are installed)	6.5 micrograms per cubic metre
Carbon monoxide	9 parts per million and no greater than 2 parts per million above outdoor levels
Carbon dioxide	N/A - Measure only
Air temperature and relative humidity	N/A - Measure only

- .9 ***For each building area where the maximum concentration limits are exceeded, identify and mitigate pollutant sources and conduct a partial building flushout for a maximum of two (2) weeks. Retest for any contaminant concentrations that were***

exceeded. Repeat process until all contaminant concentrations are within the maximum limits.

.5 Flush Out Procedure:

- .1 Perform a flush-out procedure of the HVAC system to evacuate airborne contaminants after all construction work is completed, including any punch-list items.**
- .2 Prior to flush-out, complete the following:**
 - .1 Remove any temporary filters and duct coverings installed during the construction process.**
 - .2 Complete all cleaning activities.**
 - .3 Complete testing and balancing and HVAC controls**
- .3 The quantity of outside air that must be introduced to the project space for the flush-out is 4,300 cubic metres per square metre of floor area (14,000 cubic feet per square foot).**
- .4 Occupants may move in once 1,100 cubic meters per square meter has been replaced. A total of 4,300 cubic metres of outside air must be supplied per square metre of floor area before the HVAC system is switched to its normal operational mode.**
- .5 During the flush-out, the rate of outside air shall not cause the interior space temperature do drop below 16°C (60°F) and the relative humidity shall not exceed 60 per cent.**
- .6 During an occupied flush-out phase, a minimum ventilation rate of 1.5 L/s/m² or the design minimum outside air rate, whichever is greater shall be maintained. Ventilation shall be started a minimum of three (3) hours prior to daily occupancy and shall continue while the space is occupied.**
- .6 Upon successful completion of building IAQ testing and/or flush-out, return HVAC and lighting systems to their designed and/or modified operation.**

3.08 OPERATING AND MAINTENANCE MANUALS

- .1 Ensure that O&M Manuals are complete in accordance with the requirements of Section 20 01 10.**

3.09 "AS-CONSTRUCTED" DRAWINGS

- .1 Ensure that Mechanical Division Trade(s) "As-constructed" drawings have been produced and that they accurately reflect the completed mechanical systems.**

3.10 COMPLETION

- .1 Confirm completion of all Mechanical Work, including, but not limited to:**
 - .1 Removal of all debris from inside mechanical systems and equipment.**
 - .2 Compliance with manufacturer's written instructions regarding bearing lubrication**
 - .3 Alignment of all drives to manufacturer's acceptable tolerances.**
 - .4 Adjustment of belts for proper tension.**
 - .5 Alignment of all pumps to manufacturer's acceptable tolerances.**
 - .6 Removal of all temporary protection and covers.**
 - .7 Removal of oil and grease from equipment and bases.**
 - .8 Cleaning of all fixtures and equipment. Polishing of all plated surfaces.**
 - .9 Replacement of all air and water filters.**
 - .10 Removal, cleaning and reinstallation of pipeline strainer screens.**
 - .11 IAQ Testing or Flush-out Procedure complete.**

3.11 COMMISSIONING TESTS

- .1 Verify readings, calibration and set-up of sensors and equipment, including:
 - .1 Vibration analysis on fan and pump motors;
 - .2 Temperature sensors
 - .3 Humidity sensors
 - .4 Pressure sensors
 - .5 Flow sensors
 - .6 Freeze protection devices
 - .7 Pressure switches
 - .8 Flow switches
 - .9 Status switches
 - .10 Temperature and pressure gauges and gauge connection utilization
 - .11 Control damper positioning, including tightness when closed and full open/balance position
 - .12 Alarm contacts
- .2 Verify correct sensors are reporting accurately to the distributed field panels and operator workstation.
- .3 Verify operation of building storm and sanitary drainage and vent systems, including ancillary support systems:
 - .1 Drainage and vent piping test results;
 - .1 Pressure testing results;
 - .2 Ball test results;
 - .2 Backwater valve operation;
 - .3 Trap seal primer operation;
 - .4 Sump pump system performance
- .4 Verify operation of plumbing pumping, heating and distribution piping systems, including ancillary support systems:
 - .1 Piping system test results;
 - .1 Pressure testing results;
 - .2 Flushing and cleaning test results
 - .2 Domestic water backflow preventers;
 - .3 Service water heating systems;
 - .4 Pressure boost and recirculation systems;
 - .5 Water supply pressure maintenance and stability;
 - .6 Water supply temperature including time taken for domestic hot water supply at fixture outlet from opening;
- .5 Verify operation of hydronic heating and cooling systems and distribution piping systems, including ancillary support systems:
 - .1 Chillers, heat pumps, chilled water and heating water pumping systems
 - .2 Heat exchangers, dampers, heat pump control valves, and makeup water
 - .3 Full checkout by manufacturer's startup representative
 - .4 Heat exchanger operation

- .5 System pressure and temperature control maintenance and stability
- .6 Strainer performance
- .7 Pumping system performance
- .8 Piping system pressure test results;
- .6 Verify operation of air distribution and fan systems, including ancillary support systems:
 - .1 Supply, return, exhaust fan performance;
 - .2 Heating and cooling coil temperature control performance;
 - .3 Humidifier performance;
 - .4 Control damper performance;
 - .5 Full checkout by manufacturer's startup representative;
 - .6 System pressure and temperature control maintenance and stability;
 - .7 Filter performance;
 - .8 Duct pressure test results.
- .7 Verify systems pipe cleaning and chemical treatment condition for all systems.
- .8 Verify that all cooling coil drain pans and condensate piping operate.
- .9 Verify backflow preventer operation.
- .10 Participate in Integrated Systems Testing of Fire Protection and Life Safety Systems in accordance with CAN/ULC-S1001 with all affected Trades. Provide documentation in a form satisfactory to the Authority Having Jurisdiction (AHJ) that testing has been successfully completed.
- .11 Demonstrate access to all valves, equipment and components for servicing.
- .12 Verify the response and operation of all Variable Frequency Drives ("VFD's") and Electronically Commutated Motors ("ECM's") to inputs provided;
- .13 Access to Building Automation System ("BAS") from remote workstations;
- .14 BAS system set-up, operation and alarm sequencing;
- .15 BAS Preventative Maintenance (PM) program access and read/ write revision procedures.
- .16 Verify the operation of all other mechanical equipment in accordance with its intended function;
- .17 Demonstrate equipment access for servicing and replacement at end of useful-life-expectancy.
- .18 Verify that interfacing to the work of other Divisions results in complete and operational systems.

3.12 POST OCCUPANCY EVALUATION

- .1 The post-occupancy evaluation period shall run for one full year following Substantial Performance of the facility. The Commissioning Coordinator shall meet regularly with the operating staff throughout this period to review the operation of all mechanical systems and equipment. The Commissioning Coordinator shall provide written advice regarding questions and concerns raised by the operating staff.
- .2 Resolutions of operational problems shall, where appropriate, be used to modify the Operation and Maintenance Instructions for the equipment and systems involved.
- .3 Identify areas that may come under warranty and conduct a review of condition and operation. Seek remedy under warranty for any outstanding issues and problems before end of warranty period.

END OF SECTION

CONTENTS

PART 1 - GENERAL

- 1.01 GENERAL REQUIREMENTS**
- 1.02 DESCRIPTION**
- 1.03 CODES AND STANDARDS**

PART 2 - PRODUCTS

- 2.01 GENERAL**
- 2.02 MULTI-PURPOSE FIRE EXTINGUISHERS**
- 2.03 FIRE EXTINGUISHER CABINETS**

PART 3 - EXECUTION

- 3.01 INSTALLATION OF FIRE EXTINGUISHERS**
- 3.02 INSTALLATION OF FIRE EXTINGUISHER CABINETS**

PART 1 - GENERAL

1.01 GENERAL REQUIREMENTS

- .1 Comply with requirements of the Owner's General Requirements and all documents referred to therein.
- .2 Comply with requirements of Section 20 01 10 Mechanical General Requirements.
